
Thiel, Emeline L., Germantown, Pa., gift to church, \$15,000.

Thomas College, gift by J. D. Rockefeller, New York, \$60,000.

Thompson, Mary A., Malden, Mass., gift to charity, \$40,000.

Thompson, Mrs. F. R., New York, gift to State Indian Museum, \$25,000.

Throop Institute, gift by D. K. Pearsons, Chicago, Ill., \$25,000.

Tillotson, Emma A., New York, gift to Metropolitan Museum of Art, \$10,000; to charity, \$150,000.

Tilton, Caroline S., New Orleans, La., gift to church, \$17,000; to charity, \$20,000.

Todd, J. R., Louisville, Ky., gift to Presbyterian Seminary of Kentucky, \$50,000.

Toledo Art Museum, gift by E. D. Libbey, Toledo, Ohio, \$105,000.

Townsend, Jane S., New York, gift to Yale University, \$50,000.

Trinity College, gift by John Ordonaux, New York, \$10,000; by William G. Mather, Cleveland, O., \$5,000.

Tripp, A. F., Buffalo, N. Y., gift to charity, \$5,000.

Tucker, Winfield, New York, gift to charity, \$75,500.

Tufts College, gift by Caroline M. Barnard, Everett, Mass., \$6,000; by Henry J. Braker, New York, \$1,500,000.

Tuskegee Institute, gift by Alice Byington, Stockbridge, Mass., \$50,000.

Ulmar, Catharine, New York, gift to church, \$10,000.

Union College, gift by various donors, \$100,000.

United States government, gift of 295 acres redwood forest, by William Kent, Chicago, Ill., \$50,000; Constitution Island to, by Mrs. Russell Sage, New York, \$175,000.

University of Denver, gift by Andrew Carnegie, \$50,000.

University of Michigan, gift to, by Mr. and Mrs. C. Bogardus, Pellston, Mich., \$30,000.

University of Nevada, gift to, by Clarence H. Mackay, New York, \$50,000.

University of Pennsylvania, gift by Annie W. Penfield, Philadelphia, Pa., \$5,000.

University of Pittsburg, gift to, by Wallace Will, Pittsburg, Pa., \$50,000.

University of Rochester, N. Y., gift by various donors, \$100,000.

University of Vermont, gift by John Ordonaux, New York, \$10,000.

University of Virginia, gift by John Ordonaux, New York, \$10,000; by Oliver H. Payne, New York, \$50,000.

University of Wisconsin, gift by various donors, \$30,000; by W. F. Vilas, Madison, Wis., \$3,000,000.

Upham, Mary H., Malden, Mass., gift to church, \$8,000.

Upper Iowa University, gift by various donors, \$150,000.

Upton, Albert H., Adams, Mass., gift to charity, \$10,000.

Vanderbilt, Alfred G., New York, gift to church, \$10,000.

Vanderbilt, F. W., New York, gift to Yale University, \$50,000.

Van Dyke, F. C., Paterson, N. J., gift to charity, \$10,000.

Van Read, Anna, Reading, Pa., gift to charity, \$18,000.

Vassar College, gift by Henry M. Sanders, New York, \$75,000.

Vergennes, Vt., library by Wm. G. Bixby, Chicago, Ill., \$200,000.

Vernon, Annie, Baltimore, Md., gift to charity, \$45,000.

Vilas, W. F., Madison, Wis., gift to University of Wisconsin, \$3,000,000.

Vilsak, Leopold, Pittsburg, Pa., gift to charity, \$105,000.

Walker, W. H., and family, Buffalo, N. Y., gift to charity, \$5000.

Warner, George W., Philadelphia, Pa., gift to charity, \$150,000.

Washington University, gift to, by William Barr, West Orange, N. J., \$100,000.

Watson, Catherine, Boston, Mass., library to Lunenburg, Mass., \$10,000.

Wellesley College, gift to, by various donors, \$31,023.

Wells College, gift by Andrew Carnegie, New York, \$40,000.

Wellsville, Pa., gift of school to, by Mrs. Richard Young, New York, \$40,000.

Wesley College, gift to, by J. J. Hill, St. Paul, Minn., \$25,000; by Larimori family, Grand Forks, N. D., \$25,000.

Whitman College, gift by various donors, \$120,000.

Wieboldt, W. A., Chicago, gift to Y. M. C. A., \$30,000.

Will, Wallace, Pittsburg, Pa., gift to University of Pittsburg, \$50,000.

Williams, Elizabeth C., Quincy, Mass., gift to charity, \$5,300; to church, \$9,000.

Wilson, Henry S., New York, gift to church, \$19,000; gift to charity, \$20,000.

Wittenberg College, gift to, by John W. Bookwalter, \$30,000; by Andrew Carnegie, \$5,500.

Woman's College, Baltimore, Md., gift to, by Elizabeth L. De Vinney, Glendale, Mo., \$10,000.

Woman's Exchange, gift by Mrs. Russell Sage, \$10,000.

Wood, Charles E., Washington, D. C., gift to sanitarium, \$300,000.

Wood, Meta J. Connor, Philadelphia, Pa., gift to city, \$20,000; to church, \$12,000; to charity, \$11,000.

Woodcock, Mary A. A., New York, gift to church, \$5,000; to charity, \$20,000.

Wooster University, gift by various donors, \$375,000.

Worthington, George, Pittsfield, Mass., gift to charity, \$50,000.

Wright, Henry W., Newport, N. H., gift to charity, \$5,000.

Wright, J. D., Worcester, Mass., gift to charity, \$60,000.

Yale University, gift by D. W. James, New York, \$95,000; by Mrs. J. H. Husted, Denver, Colo., \$8,000; by Jane S. Townsend, New York, \$50,000; by Frederick Hewitt, New York, \$500,000; additional gift, \$805,000; by George B. Briggs, Newton, Mass., \$75,000; by F. W. Vanderbilt, New York, \$50,000.

Y. M. C. A., gift by Hiram P. Oliver, Bangor, Me., \$55,000; by Sarah Kemmerer, Bloomington, Ill., \$35,000.

Y. M. C. A., Chicago, gift by John G. Shedd, Chicago, \$100,000; by W. A. Wieboldt, Chicago, \$30,000; by various donors, \$11,000; by various donors, \$16,278; by various donors, \$58,000; by William Deering, Chicago, \$10,000; by James L. Houghteling, Chicago, \$10,000; by Mrs. C. B. Blackstone, Chicago, \$25,000; by Nettie F. McCormick and sons, \$50,000; by J. Ogden Armour, Chicago, \$25,000; by J. V. Farwell and son, Chicago, \$25,000.

Young, Mrs. Richard, New York, gift of school to Wellsville, Pa., \$40,000.

GILBERT AND ELLICE ISLANDS. Two groups of islands in Polynesia, a British protectorate. Area, 180 square miles; population, 30,300

DANIEL COIT GILMAN

(300 Europeans). On Ocean and Pleasant islands, in the Gilbert group, are phosphate deposits estimated at 50,000,000 tons and controlled by a London company. Chinese, Japanese, and natives are employed in working them. The annual shipment of phosphates is from 250,000 to 300,000 tons, of which 100,000 tons go to Japan, 80,000 to Australia, and the remainder to Europe. Copra is another important export. The Resident Commissioner in 1908 was W. Telfer Campbell.

GILMAN, DANIEL COTT. An American educator, died on Oct. 13, 1908. He was born in Norwich, Conn., on July 6, 1831, graduated at Yale in 1852, continued his studies there for a time and then in Berlin and Cambridge. He was librarian and secretary of Sheffield Scientific School, at Yale, and professor of physical and political geography there, from 1856 to 1872, and president of the University of California from 1872 to 1875, when he was chosen first president of Johns Hopkins University, of which he took charge in the following year. In this position he remained until 1901, when he resigned, having meanwhile done much toward establishing the institution upon a firm foundation by selecting for its faculty either men of widely recognized ability, or younger professors who have since fully justified the wisdom of his selection. Among such men were Professor Gildersleeve, for the Latin and Greek department; William Keith Brooks (q. v.), the biologist; Henry A. Rowland, the physicist; Ira Remsen, the chemist, and James J. Sylvester, the mathematician. Dr. Gilman also had an active part in the organization of the Johns Hopkins Hospital. He was also first president of the Carnegie Institution, and served in that capacity from 1901 to 1904. Dr. Gilman was one of the original trustees of the John F. Slater Fund, a trustee and vice-president of Peabody Educational Fund, and a trustee of the General Education Board. He was appointed by President Cleveland in 1896 a member of the United States Commission on the boundary line between Venezuela and British Guiana, and in the following year was a member of the commission which drafted a new charter for the city of Baltimore. From 1901 to 1907 he was president of the National Civil Service Reform League, succeeding Carl Schurz, and in 1908 he was chosen one of the trustees of the Russell Sage Foundation, established by Mrs. Sage, with an endowment of \$10,000,000. In 1900 he became one of the three editors of the *New International Encyclopædia*. He had published *Life of James Monroe* (1883), in the "American Statesman Series"; *University Problems* (1888); *Life of James D. Dana* (1899), and *Launching a University* (1906).

GIRLS' FRIENDLY SOCIETY IN AMERICA. An organization of the women of one Protestant Episcopal Church, founded in 1877. It bands in one society church women as associates, and young women as members for mutual help, religious and secular. The society is in affiliation with a similar association in England, founded in 1875. It has extended all over the United States, and had in 1908 about 600 branches with a membership of 34,000 women and girls. The president is Miss Mary A. L. Neilson, of Philadelphia, and the secretary, Miss Eve Alexander, of Baltimore, Md.

GLANDERS IN MAN. Acute glanders in the human subject is looked upon as a rare disease, usually contracted by men having to do with horses—coachmen, soldiers, veterinarians, farmers, etc. Several fatal cases among laboratory workers occurring during the year 1908 served to direct attention to this gruesome and fatal disease. The malady is an infection by the *Bacillus malleus*, and is characterized by the appearance of nodular foci of inflammation in the skin, muscles and lungs. It was first described in the fourth century, by Hecker, under the name of "malleus." Royer, in 1837, described the human infection, and in 1840 the contagiousness of the disease was established by animal inoculation. The acute form is generally fatal; in the chronic form the mortality is 40 to 50 per cent. Infection is believed to take place through the nasal mucous membrane, the bacillus having extraordinary penetrative powers, and resisting desiccation for a long period.

GLASS, HENRY. An American rear-admiral, died at Paso Robles, California, Sept. 1, 1908. He was born on Jan. 7, 1844, at Hopkinsville, Ky., graduated at the Naval Academy in 1863, and served until the end of the Civil War in the South Atlantic Blockading Squadron, taking part in several engagements in Charleston Harbor and along the South Carolina coast. He had reached the rank of captain at the beginning of the Spanish War and was assigned to command the *Charleston*, then at the Mare Island Navy Yard, San Francisco. He convoyed the first expedition of troops from San Francisco to Manila, capturing the island of Guam on the way, and took part in the bombardment, resulting in the surrender of Manila, Aug. 13, 1898. He became rear-admiral in 1901 and retired in 1906.

GOLD. The output of gold in the United States during 1908 not only exceeded that of 1907 by 6.5 per cent., but was the largest annual production ever recorded, amounting to \$96,313,300, as compared with \$90,435,700 in 1907, and \$94,373,800 in 1906, which year hitherto had held the record for the greatest production. The gold production for the United States is given in the accompanying table, the statistics for 1908 being the preliminary estimates of the Director of the Mint. South Dakota, Alaska, California, and Colorado showed large increases, ranging from \$2,000,000 to \$3,600,000. The estimates for Utah indicated a decrease of about \$1,200,000; for Nevada a decrease of \$3,300,000. The production of Montana, Arizona, Idaho, Oregon, and other silver-producing States remained approximately stationary. The production from the Philippine Islands showed a gratifying increase, the estimate of the mint being \$306,708, against \$78,700 in 1907. This amount, while not large, seemed to indicate that mining gradually is being established in these islands on a firm basis. As part of the Philippine gold does not reach the United States mints, the showing for the year was probably even better than the figures indicated. Most of the gold was recovered by quartz mining in Benguet and by dredging operations in Paracale.

In the year 1908, six States, Colorado, Alaska, California, Nevada, South Dakota and Utah, each of which for 1907 or 1908, had a production of \$5,000,000, or over, supplied 90.4 per cent. of the total production as given in the accompany-

ing table, while, in addition, there were four other States, Montana, Arizona, Idaho and Oregon, which produced over \$1,000,000 each in 1908. No other State reached a total as high as \$250,000. Recent attempts to increase the output of mines in Alabama and North Carolina did not show any striking results, while from Porto Rico the return was inconsiderable.

The gold-mining industry of the United States had a successful and prosperous year in 1908, in spite of many adverse conditions of trade and finance. The immediate causes operating to increase the output were, in part, the removal of certain abnormal features tending to depress the production in 1907, such as the partial closing of the Homestake mine in the Black Hills of

South Dakota and the labor difficulties in the Mother Lode counties of California.

To some degree the increased production of gold is also indirectly due to the closing of many mines in the base metal camps. A tendency toward increased production by small operators was noted as early as the last months of 1907 and continued through 1908.

The depression in the base-metal industries did not affect the gold production to any considerable degree, for the total base-metal ores contribute only from 9 to 10 per cent. of the normal gold output of the country. The gold from copper ores suffered little reduction, but the small amounts contributed from lead and zinc ores were much reduced.

PRODUCTION OF [GOLD IN THE UNITED STATES, 1906-1908.

(a) *Mineral Industry*, Vol. XV. (b) U. S. Geological Survey and Director of the Mint. (c) Included in other States. a Gold value, \$20.671834625323 per fine ounce.

In the year 1908, the exports of gold from the United States amounted to \$81,215,456, and exceeded the imports by \$30,969,357; whereas in 1907, the excess of imports over exports was \$88,182,391, occasioned by the large amounts borrowed in the financial crisis of November and December of that year, which, in part, were repaid during 1908. In Great Britain also the same relative movement occurred in the two years and the excess of exports in 1908 was occasioned largely by loans to France, which country in both years was engaged in accumulating gold to secure their reserves. The exports of gold were £46,145,314, as compared with £57,088,547 in 1907. The imports in 1908 were £49,969,099, and in 1907 £50,866,009. The excess of exports in 1908 was £3,823,785 and of imports in 1907 £6,222,538. In Germany the excess of imports (\$91,028,000) was \$76,843,000, as against \$5,060,000 excess of exports (\$55,450,000) in 1907.

The output of the gold mines of the world in 1908 showed a substantial increase over that of

1907, practically all the gold-producing states having increases, with the exception of those of Australasia, where a decrease of about \$1,500,000 was noted. This is shown in the following table of approximate production, given in the annual statistical review of *The Engineering and Mining Journal* (New York, Jan. 9, 1909).

Mineral Industry. Vol. XVI.

GOLD COAST. A British colony in West Africa, on the Gulf of Guinea Area, including Ashanti (q. v.), 119,260 square miles; population (1906), 1,696,965. The largest towns are Accra, the capital, 14,842 inhabitants; Cape Coast Castle, 28,948; Ada, 13,240. In 1907 gold mining yielded 273,898 ounces, valued at £1,163,517, to which Ashanti contributed £329,892, while the gold obtained by dredging was valued at £56,774. The production of cacao in 1907 was 21,744,000 pounds. The export of cotton in 1907 was 56,088 pounds. The imports in 1907, including specie, amounted to £2,366,195 (£1,758,315 from Great Britain); the exports, £2,041,674 (£1,945,626 to Great Britain). The principal imports were: Cotton goods, £508,754; machinery, £161,798; spirits, £133,500; wearing apparel, £82,070; provisions, £88,120; hardware, £54,113; coal, £36,881; building materials, £32,-

520. The principal exports were: Cacao, £515,089; gold, gold dust, and gold concentrates, £1,164,676; lumber, £169,458; palm-kernels, £101,822; palm-oil, £119,468; rubber, £333,120; cola nuts, £78,901. The government railway from Secondi, on the coast, to Kumassi is 168 miles long. The telegraphs have a length of over 1128 miles. The revenue and expenditure in 1907 were £708,718 and £617,124 respectively. The Governor in 1908 was Sir John Pickersgill Roger.

GOLF. Jerome D. Travers, for the second successive year, won the highest golf honors. He was victorious in the national amateur championships at Garden City and in the New Jersey championships at Englewood, and also won the Huntington and Morris County open tournaments. In the national championship

tournament he defeated Max Behr, 8 up and 7 to play, and in the New Jersey championships defeated Behr, who was again runner-up, 11 up and 9 to play. Travers, however, lost to C. H. Seeley in the final round for the Metropolitan championship, after being 6 up at the end of the first round. The women's national championship was won by Miss Kate C. Harley, of Fall River, with Mrs. T. H. Polhemus, of Staten Island, as runner-up. The fourteenth annual open championship tournament of the United States Association resulted in a tie between F. McLeod and W. Smith. In the 18-hole play-off, McLeod won by the score of 77 to 83. Other important tournaments, held in the United States, and their winners were: Metropolitan Open, at Baltusrol, J. Hobens; Western Open, at St. Louis, W. Anderson; Western Amateur Championship, at Rock Island, M. E. Phelps; Southern Amateur Championship, at Memphis, N. Whitney; Middle Atlantic States Championship, at Washington, F. O. Korstman; Eastern Professional Championship, at Fox Hills, Isaac Mackie.

The British open professional championship was won, for the fourth time since 1900, by James Braid, who made the record score of 291 for four rounds. Other foreign tournaments and their winners were: French Championship, at Versailles, J. H. Taylor; German Championship, at Berlin, A. Gordon; Irish Championship, at Newcastle, J. F. Mitchell.

The intercollegiate championship tournament, held at Brae Burn, Boston, was won by the Yale team, which defeated Harvard in the finals by the score of 14 to 9. The individual championship was won by H. H. Wilder, of Harvard, by defeating T. Briggs, 6 up and 5 to play. In the annual dual tournament between Princeton and Williams, the latter was successful by a score of 10 to 4.

GOMEZ, JOSÉ MIGUEL President of Cuba. See CUBA.

GOBE, THOMAS PRYOR, United States Senator (Democrat), from Oklahoma. He was born in Webster County, Miss., on Dec. 10, 1870. At an early age, through accidents, he became totally blind. He graduated at the Walthall Normal School, Miss., in 1890, and from the law department of Cumberland University in 1892; and was admitted to the bar. He practised law for a time in Mississippi, and in 1895 moved to Texas. In 1896 he was delegate to the National Convention of the Populist Party, and in 1898 was defeated for Congress as a candidate of that party. He became identified with the Democratic party in 1899 and two years later moved to Oklahoma. From 1902 to 1905 he was a member of the Territorial Council. In Nov., 1907, he was appointed United States Senator by the Governor, and the following month was elected to that office by the Legislature for the term expiring Mar. 3, 1909. In 1908 he was re-elected for the term expiring Mar. 3, 1915. As Senator in May, 1908, he took an active part in the filibuster against the passage of the Aldrich-Vreeland currency bill.

GOSCHEN, SIR WILLIAM EDWARD. A British diplomat, appointed ambassador to Berlin, to take effect in Oct., 1908. He was born on July 8, 1847, was educated at Rugby and Oxford, and entered the diplomatic service in 1869. He served as attaché at Madrid in 1870,

and became third secretary there in 1873; became a member of the legation at Paris in 1875; was second secretary at Rio de Janeiro in 1877; and in 1880 was a member of George Joachim Goschen's special embassy to Constantinople, where he became second secretary in 1881. After serving as secretary at Pekin (1885), at Copenhagen (1888), and at Lisbon (1890), he became secretary of the embassy at Washington in 1893, and then at St. Petersburg (1894), where he acted as minister plenipotentiary during the absence of the ambassador. He was envoy extraordinary and minister plenipotentiary at Belgrade in 1898-1900, and at Copenhagen in 1900-1905, when he became ambassador to Vienna, where he remained until appointed to Berlin.

GRADES FOR COTTON. See COTTON.

GRADUATE SCHOOL OF AGRICULTURE. See AGRICULTURE.

GRAVES, JOHN TEMPLE. An American journalist, vice-presidential candidate of the Independence Party in 1908. He was born at Abbeville, S. C., on Nov. 9, 1856, and graduated at the University of Georgia in 1875. He was editor of the *Daily Florida Union*, Jacksonville (1881-83); of the *Atlanta Daily Journal* (1887-88); and of the *Tribune of Rome* (1888-90). In 1884 he was elector-at-large on the Florida Democratic ticket, and in 1888 was a successful candidate for the same office in Georgia. He became editor-in-chief of the *Atlanta Daily Georgian* in 1905 and since 1907 has been the editor of the *New York American*. In July, 1908, he was nominated for vice-president by the Independence Party. Mr. Graves is widely known as a public speaker, and is the author of *History of Florida of To-Day*; *History of Colleton, S. C.*; and *Twelve Standard Lectures*.

GREAT BRITAIN. The area and population of the United Kingdom of Great Britain and Ireland in 1901 and 1908 were as follows, by subdivisions:

	Area, sq. Miles	Total, 1901	Estimated total, 1908
England and Wales....	58,324	32,527,843	35,348,780
Scotland	30,405	4,472,103	4,826,587
Ireland	32,360	4,468,775	4,826,587
Isle of Man	227	54,752	
Channel Islands	75	95,718	
Army, navy, and merchant seamen abroad		367,736	
Total	121,391	41,976,927	44,538,718

In 1901 the population to the square mile in England was 436.7; in Wales, 195.5; in Scotland, 150.1; in Ireland, 136.7. The percentage of the population living in the various divisions of the United Kingdom in 1901 was as follows: England, 74.1; Wales, 4.1; Scotland, 10.8; Ireland, 10.7. The percentage of the population living in Ireland decreased from 23.7, in 1851, while that of England increased from 61.0 in 1851.

The births, deaths, and marriages in 1907 were as follows:

	Births		Deaths		Marriages	
	Number	Rate per 1000 of population	Number	Rate per 1000 of population	Number	Rate per 1000 of population
England and Wales	917,636	26.3	524,311	15.0	276,031	15.8
Scotland	128,789	27.0	77,267	16.2	33,260	13.9
Ireland	101,563	23.3	77,410	17.7	22,122	10.1
United Kingdom	1,147,988	26.0	678,988	15.4	331,413	15.0

The number of emigrants in 1907 was the highest yet recorded. Taking the passengers to and from non-European countries, those outward bound numbered 634,949, while those inward bound numbered 293,633, giving a balance of 341,316 out-going passengers. This figure roughly represents the number of actual emigrants. The number of British and Irish emigrants was 235,092, and of foreign emigrants, 109,857. Of the former, 131,433 sailed for other parts of the British empire, 117,525 going to Canada alone, while the number going to foreign countries was 103,659 (99,944 to the United States). As regards passengers to and from European countries, there was a balance inward of 113,385, the incoming passengers numbering 949,379, and the outgoing passengers, 835,994.

The estimated population of the principal cities in England and Wales in 1907 was: London, 4,758,218 (Greater London, 7,217,941); Liverpool, 746,144; Manchester, 643,148; Birmingham, 553,155; Sheffield, 455,453; Bristol, 367,979; Bradford, 290,323; West Ham, 308,284; Hull, 266,762; Nottingham, 257,489; Salford, 276,670; Newcastle on Tyne, 272,669; Leicester, 236,124; and in Scotland: Glasgow, 847,584; Edinburgh, 345,747; Aberdeen, 174,579; Dundee, 165,748. The population of Dublin and Belfast, Ireland, in 1901, was 296,638 and 349,180 respectively.

PUBLIC EDUCATION. Elementary education is compulsory in England and Scotland for the age period from 5 to 14, but total or partial exemption may be secured at the age of 11 in England and of 12 in Scotland. The proportion of persons who were unable to write their names on the marriage register in England and Wales in 1905 was 1.6 per cent. for males and 2.0 per cent. for females; in Scotland, in 1905, 2.17 per cent. for males and 1.61 per cent. for females; and in Ireland, in 1906, 8.6 per cent. for males and 6.2 per cent. for females.

The central educational authority for England and Wales is the Board of Education, created in 1899. A Welsh department of the Board was established in 1907. The code drawn up by the Welsh department provides for the teaching of the Welsh language and literature, and allows any of the subjects of the curriculum to be taught in Welsh. In 1906, local education authorities were given the power to provide meals for children attending public schools. In 1908 the Consultative Committee of the Board of Education recommended the establishment of nursery schools for children between the ages of three and five. In 1907 there were in England and Wales 20,907 ordinary elementary schools (7,230 "Council," or public, and 13,671 "voluntary," or sectarian), with an enrollment of 5,509,456, and an average attendance of 88.43 per cent. Secondary schools in receipt of government aid numbered 768 in 1907, with 116,678

pupils. Evening schools in receipt of aid numbered 5,728 in 1906, with 749,473 pupils. In Scotland, with an Education Department of its own, there were, in 1907, 3,285 elementary and higher grade schools in receipt of aid, with 811,000 registered pupils and an average attendance of 711,228. There were also 772 continuation classes, with 107,622 pupils. Secondary schools under inspection numbered 109. In Ireland, elementary education is under the control of Commissioners of National Education, under whom there were, in 1907, 8,538 elementary schools, with an enrollment of 732,460 pupils, and an average attendance of 485,979. There were 5,951 schools attended exclusively by pupils of one denomination, namely, 4,389 schools with 366,473 Roman Catholic pupils, and 1,562 schools with 116,331 Protestant pupils. The funds for the maintenance of primary and secondary education are derived partly from Parliamentary grants and partly from local rates, endowments, subscriptions, etc.

Besides the old universities of Oxford and Cambridge, there are now universities at London, Durham, Manchester, Leeds, Liverpool, Sheffield, and Birmingham; the University of Wales; the universities of St. Andrews, Aberdeen, Glasgow, and Edinburgh; and Dublin University. In 1908 a joint committee, consisting of representatives of labor and representatives of the University of Oxford, proposed a plan whereby workmen may be enabled to enter Oxford and study there for a period of at least two years, not as candidates for the regular degrees, but as aspirants to a diploma which the university may grant for proficiency in certain branches of knowledge. The establishment of a Catholic teaching and degree-conferring university for Ireland was decided upon in 1908. See below, *History*.

FISHERIES. The total value of the fish landed on the coasts of the United Kingdom in 1908 was £10,897,841, against £11,686,674 in 1907. The following table distinguishes the coasts on which they were landed:

	Quantity Cwts.	Value
England and Wales—		
Fish, excluding shell fish	13,270,406	£7,739,334
Shell fish		293,650
Total value		£8,032,984
Scotland—		
Fish, excluding shell fish	8,629,968	£2,511,492
Shell fish		74,239
Total value		£2,585,731
Ireland—		
Fish, excluding shell fish	687,162	£261,605
Shell fish		17,521
Total value		£279,126

AGRICULTURE. The following table shows the acreage of crops and number of live stock in Great Britain, Ireland, and the United Kingdom, in 1907:

	Great Britain	Ireland	United Kingdom (Incl. Isle of Man and Channel Is.)
Cultivated Area.....	Acres. 32,243,447	Acres. 14,629,593	Acres. 46,997,546
Wheat	1,625,445	38,143	1,665,017
Barley	1,712,094	170,431	1,885,359
Oats	3,122,898	1,075,390	4,218,541
Rye	61,211	8,868	70,204
Beans	309,730	1,835	311,684
Peas	166,136	324	166,608
Green crops	3,088,153	1,002,980	4,114,535
Flax	372	59,659	60,031
Hops	44,938		44,938
Small fruit	82,175	11,449	94,175
Bare fallow	261,450		261,717
Clover, sainfoin, etc.	4,490,961	2,155,662	6,693,017
Permanent pasture	17,277,884	10,104,852	27,411,720
Orchards	250,176	306,661	
Live stock—			
Horses (in agriculture)	1,556,369	523,102	2,089,027
Cattle	6,912,067	4,676,493	11,630,142
Sheep	26,115,455	3,816,609	30,011,833
Pigs	2,636,766	1,317,068	3,967,163

The acreage under permanent pasture is exclusive of heath or mountain land. Woods, coppices, and plantations occupied in Great Britain, in 1905, 2,768,243 acres; in Ireland, in 1907, 306,661 acres. The estimated total produce of the principal crops in Great Britain, Ireland, and the United Kingdom, in 1907, is shown in the following table:

	Great Britain	Ireland	United Kingdom (Incl. Isle of Man and Channel Is.)
Wheat	Bushels. 55,206,195	Bushels. 1,325,003	Bushels. 56,531,198
Barley	60,370,180	6,722,141	67,092,321
Oats	134,392,119	49,296,631	183,688,750
Beans	10,629,041	82,512	10,711,553
Peas	4,736,616	9,141	4,745,757
Potatoes	Tons 2,977,485	Tons 2,246,488	Tons 5,223,973
Turnips and swedes	22,085,718	4,095,710	26,181,428
Mangold	8,936,922	1,181,551	10,118,473
Hay	10,429,234	5,173,946	15,603,180
Hops	Cwts. 374,129		Cwts. 374,129

Preliminary returns of some of the crops of Great Britain in 1908 were as follows: Potatoes, 3,919,768 tons; turnips and swedes, 23,738,207 tons; mangold, 8,987,161 tons; hay, 7,181,391 tons; wheat, 54,178,000 bushels; barley, 56,437,000 bushels; oats, 127,641,000 bushels; beans, 9,122,000 bushels; peas, 4,494,000 bushels.

MINING AND METALS. The total number of persons employed in the mines and quarries of

the United Kingdom and the Isle of Man in 1907 was 1,060,034, of whom 972,220 were employed in or about mines, and 87,814 in or about quarries. In 1906, the numbers were, respectively, 1,004,092; 912,576; and 91,516. The number of separate fatal accidents in or about mines and quarries in 1907 was 1,283, causing the loss of 1,368 lives. Compared with 1906 there was an increase of 93 accidents and 93 deaths. In 1908, there were 1,306 killed in accidents in and around mines. Of this number 1,161 were underground fatalities. The value of the total mineral production in 1907 was £135,279,088, against £105,842,992 in 1906. The quantity and value of the principal minerals produced in 1907 were as follows:

	Tons.	Value at mines and quarries
Chalk	4,779,387	£ 200,882
Clay and shale	14,827,895	1,850,387
Coal	267,830,962	120,527,378
Gravel and sand	2,400,392	183,625
Igneous rocks	5,674,470	1,158,951
Iron ore	15,731,604	4,433,418
Lead ore	32,533	419,247
Limestone (other than chalk)	12,509,142	1,323,624
Oil shale	2,690,028	806,323
Salt	1,984,656	648,696
Sandstone	5,012,053	1,397,285
Slate	443,554	1,178,609
Tin ore (dressed)	7,080	706,700
Zinc ore	20,082	100,533

The increase in the total value of the minerals raised in 1907 over that in 1906 is mainly accounted for by the increased output of coal (251,067,628 tons in 1906) and the rise in the average price of coal from 7s. 3.49d. a ton in 1906 to 9s. in 1907. The 1907 output of coal was the highest on record. The quantity of coal exported during the year (exclusive of coke and patent fuel, and of coal shipped for the use of steamers engaged in foreign trade) was 63,600,947 tons, against 55,599,771 tons in 1906. Of the 1907 exports, France received over 10,600,000 tons, Italy over 8,250,000, Germany over 10,000,000, the Netherlands over 3,750,000, Sweden over 3,600,000, and Russia, Spain, Denmark, Egypt, and Argentina each over 2,000,000 tons. Adding the 2,968,501 tons exported in the form of coke and patent fuel, and the 18,618,828 tons shipped for the use of British and foreign steamers engaged in foreign trade, the total quantity of coal which left the country was 85,188,276 tons. Of the 182,642,686 tons remaining in the country, 21,119,547 tons were used during the year in blast furnaces for the manufacture of pig iron, against 20,836,795 in 1906.

The output of iron ore shows an increase of 231,198 tons over that of 1906. The ore yielded 5,126,949 tons of iron, valued at £19,004,413, or more than one-half the total quantity of pig iron made in the country, which amounted to 10,114,281 tons, against 10,109,453 tons in 1906. Other metals produced from British ore in 1907 were: Copper, 666 tons, valued at £62,673; gold, 1,911 ounces, valued at £6,228; lead, 24,460 tons, valued at £479,722; silver from lead, gold, and silver ores, 153,684 ounces, valued at £19,331; tin, 4,407 tons, valued at £769,438; zinc, 7,600 tons, valued at £186,612.

TEXTILE INDUSTRY. For the year ending Aug. 31, 1908, the number of cotton spinning spindles in operation was estimated at 52,817,582, of which 32,197,712 reported short time. The mill consumption of cotton were 3,841,981 bales, of which 3,272,075 bales were American, 76,058 East Indian, 396,135 Egyptian, and 97,713 various. The export of domestic cotton manufactures, including yarn, cloth, and other manufactures, was valued at £110,438,231 in 1907.

The wool clip in 1907 was estimated at 131,000,000 pounds; imported wool at 806,000,000; wool obtained from imported sheep skins, 32,000,000; and wool obtained from imported woolen rags, 113,000,000. The exports of wool comprised 31,000,000 pounds of domestic wool and 314,000,000 pounds of foreign wool re-exported. There was thus retained for home consumption 737,000,000 pounds of wool. The exports of woolen manufactures, including yarn and piece goods, in 1907, were valued at £34,161,000.

The domestic production of flax and tow in 1907 was estimated at 24,000,000 pounds, imports were 232,000,000 pounds, and exports 7,000,000 pounds, so that 249,000,000 pounds were retained for home consumption. The value of the exports of linen and jute manufactures in 1907 (yarn, piece goods, and other manufactures), was £10,023,317. (For the exports of textile manufactures in 1908 see below, *Commerce*).

SHIPBUILDING. Lloyd's Register of British and Foreign Shipping reported that during 1908, exclusive of warships, 523 vessels of 929,669 tons gross (viz., 454 steamers of 914,570 tons and 69 sailing vessels of 15,099 tons) had been launched in the United Kingdom. (See SHIPBUILDING.) The warships launched in both government and private yards amounted to 36 of 74,186 tons displacement. The total output for the year, therefore, was 559 vessels of 1,003,855 tons. The output of mercantile tonnage in the United Kingdom during 1908 showed a decrease of 678,221 tons from that of last year, and was the lowest total recorded by the society for fifteen years. As regards war vessels the total for 1908 was 60,289 tons less than in 1907. Practically the whole of the tonnage launched has been built of steel and over 98½ per cent. is composed of steam tonnage. Of the total output, 60 per cent., of 554,995 tons (547,080 steam tons and 7915 sailing tons) has been built for registration in the United Kingdom. The sailing tonnage of the United Kingdom apparently was decreased by about 75,400 tons, and the steam tonnage increased by 245,000 tons. The net increase of United Kingdom tonnage at the end of 1908 was about 169,600 tons. The amount of tonnage launched for abroad during 1908 was 374,674 tons, forming 40 per cent. of the total output, as compared with 34 per cent. in 1907.

The accompanying table from *Engineering* (London) gives the tonnage built for foreign countries and the British Colonies. Belgium and Holland, as will be seen, figured more prominently than in preceding years; but this was due entirely to the construction of a huge liner for each country, the Holland ship being the largest of the year, while the Belgian ship takes second place. Norway, as well as Sweden, was a leading customer, and the low prices ruling encouraged them to take quite a number of vessels of from 2000 to 3000 tons, built mostly

on the North-East Coast. The same applied to Sweden. Two liners for Italy and some few vessels for France were also favorable features, but Germany, seriously reduced her quota. Greece was fairly active in her demands. The best customers were the Colonies and the South American Republics, as a great variety of river craft were sent to the South American Republics. *Countries where British-Built Foreign-Owned Ships were Registered.*

British Shipbuilding by Districts.

The British shipbuilding during the year taken by districts as reported by *Engineering*, London, was as follows for the calendar years:

District.	Total Production	
	1908	1907
	No.	tons
<i>Scotland</i>		
Clyde (including outports).....	532	352,800
Other Scotch ports.....	90	45,000
<i>England.</i>		
Tyne	112	213,000
Wear	40	85,000
Tees	25	59,000
Hartlepool	13	37,000
Barrow-in-Furness (including Workington and Maryport).....	15	15,000
Mersey	68	23,000
Blyth and Whitby.....	8	6,725
Humber (Hull and Grimsby).....	86	20,500
Thames and other English and Welsh ports.....	348	18,200
<i>Ireland.</i>		
Belfast and Londonderry.....	22	158,600

EXCISABLE ARTICLES. The production of spirits in 1907 amounted to 49,019,149 proof gallons; beer, 34,438,373 barrels; glucose, 1,014,224 cwts.; chicory, 1,527 cwts.; saccharine, 206,323 ounces. The exports of British produce in 1907 were: Spirits, 8,657,754 proof gallons; beer, 651,899 barrels; glucose, 38,340 cwts.

FOREIGN COMMERCE. In 1908 the total imports amounted to £593,140,723—a decline of £52,667,219 from 1907, and the total exports, £377,219,579—a decline of £48,815,504 from 1907. The imports of gold bullion and specie in 1908 amounted to £46,145,314; silver, £10,326,889. The exports of gold bullion and specie in 1908 were £49,969,099; silver, £13,283,388, the excess of exports over imports being an unusual condition for Great Britain. The table on page 312 shows the values of imports and exports of merchandise in 1908 by principal classes and groups, and the per cent. increase (+) or decrease (—) of each group as compared with 1907:

IMPORTS AND EXPORTS OF THE UNITED KINGDOM IN 1908.

Classes of Merchandise	Total imports	Per cent. inc. (+) or dec. (—)	Exports of domestic produce	Per cent. inc. (+) or dec. (—)
I. Food, drink, and tobacco—				
Grain and flour	£72,734,817	— 3.5	£3,524,943	+14.1
Meat, including animals for food	49,488,539	— 4.6		
Other food and drink—				
1. Non-dutiable	68,587,646	+ 1.6	15,968,213	— 6.4
2. Dutiable	48,247,930	— 0.1

Miscellaneous	25,846,353	—80.6	29,627,317	—10.3
Total	£143,124,035	— 7.6	£297,061,087	—13.1
Miscellaneous and unclassified	£2,279,836	— 3.3	£5,828,630	— 7.1
Totals	£593,140,723	— 8.1	£377,219,579	—11.4

Following are some further details respecting the imports of foods and raw materials in 1908: Wheat imports were valued at £38,295,940, of which £2,053,788 worth came from Russia, £823,216 from Rumania, £11,450,396 from the United States, £13,112,215 from Argentina, £904,588 from Chile, £1,297,138 from the British East Indies, £2,421,286 from Australia, and £5,911,173 from Canada. Wheat meal and flour

amounted to £7,075,231 (£5,369,406 from the United States; £890,700 from Canada). Barley was valued at £6,113,945 (£2,581,624 from Russia). Oats were valued at £4,162,775 (£1,108,787 from Russia; £1,225,708 from Germany). To the maize import, valued at £10,388,061, Argentina contributed £5,660,599 worth, the United States, £2,015,701, and Russia, £1,526,803. Rice imports were valued at £2,594,896, and living

animals for food at £6,671,810. Fresh beef imports amounted to £10,308,380, of which £6,102,926 came from Argentina, £3,268,584 from the United States, and £541,600 from New Zealand. Fresh mutton came principally from Australia, £1,195,259; New Zealand, £3,452,584; and Argentina, £2,512,656. Bacon came principally from Denmark, £5,685,526; the United States, £6,035,498; and Canada, £2,518,222. Hams came principally from the United States, £2,240,238, and Canada, £835,194. The total imports of meats amounted to £41,763,430. The imports of butter amounted to £24,082,537 (from Sweden, £1,430,769; Denmark, £10,984,722; New Zealand, £1,250,211). To the cheese import, valued at £6,684,203, Canada contributed £4,555,751. Egg imports amounted to £7,183,112. The imports of refined sugar amounted to £12,199,453 (£8,969,695 from Germany), and unrefined sugar, £7,814,788 (£3,994,393 from Germany). To the tea imports, £10,745,588, British India contributed £5,770,094, and Ceylon, £3,588,265. Raw cotton from Egypt amounted to £13,698,676; United States, £39,286,262; British India, £1,414,973; Brazil, £185,130. Wool from Argentina amounted to £1,680,061; British South Africa, £2,892,521; Australia £13,412,254; New Zealand, £5,941,765.

The trade with the principal countries of import and export in 1907 was as follows:

From and to	Total imports	Total exports (inc. colonial and foreign)
Russia	£31,423,088	£19,063,421
Sweden	11,066,767	7,910,939
Norway	6,613,555	4,949,740
Denmark	18,459,924	6,317,439
Germany	38,782,062	56,729,988
Netherlands	36,831,888	19,005,040
Belgium	28,291,426	19,354,022
France	52,832,526	33,507,544
Spain	16,843,186	5,892,082
Italy	3,850,875	15,252,483
Turkey	6,006,524	7,809,627
Egypt	22,225,375	10,231,034
China	3,471,933	12,137,977
Japan	3,241,568	12,279,498
United States	133,683,631	58,052,574
Brazil	9,735,470	10,546,092
Argentina	26,479,724	18,294,492
Chile	6,037,215	7,765,794
Total of foreign countries (including others)	488,670,888	370,523,086
Canada	28,029,461	19,220,973
Australia	33,836,353	27,146,803
New Zealand	17,783,749	9,441,908
British India	43,939,184	53,311,127
Straits Settlements	9,019,532	3,959,206
Cape Colony	16,098,618	10,581,778
Total of British possessions (including others)	157,137,054	147,454,081

The imports into Irish ports in 1907 amounted to £61,617,225, and the exports, £60,521,245, showing an increase over 1906 of £4,005,281 and £3,287,547 respectively.

SHIPPING AND NAVIGATION. The total net tonnage, with cargo and in ballast (foreign trade), entered and cleared at the ports of the United Kingdom in 1907, was 66,240,913 and 67,030,807 respectively. Of that entered, 40,415,618 was British; of that cleared, 40,892,824. The leading foreign flags represented were, in the order of their importance, the German, Norwegian, Danish, Swedish, Dutch, French, and Spanish. The tonnage entered and cleared in the coast traffic, with cargo and in ballast, was 60,600,992 and 59,887,070 respectively, about one-fifteenth being foreign. On Dec. 31, 1907,

there were registered as belonging to the United Kingdom 11,304 steamers, of 10,023,723 net tons, and 9648 sailing vessels, of 1,461,376 net tons, making a total of 21,042 vessels of 11,485,099 net tons (18,089,642 gross tons), against 20,764 vessels of 11,167,332 net tons (17,458,936 gross tons) at the end of 1906.

INTERNAL COMMUNICATIONS. On Dec. 31, 1907, there were in the United Kingdom 23,108 miles of railway open, of which 15,897 were in England and Wales, 3,849 in Scotland, and 3,362 in Ireland. The results of the operations of railways in the United Kingdom during 1907 were as follows: Number of passengers, exclusive of season ticket holders, 1,259,481,000; merchandise carried, including minerals, 515,887,000 tons; total gross receipts, £121,548,923; working expenditure, £76,609,194; net receipts, £44,939,729; proportion of working expenditure to gross receipts, 63 per cent. The paid-up capital of all railways in the United Kingdom, including loans and debenture stock, on Dec. 31, 1907, was £1,294,066,000, and the average rate of dividend or interest during the year was 3.44 per cent.

The length of telegraph line owned by the State on March 31, 1907, was 56,597 miles. The telegraph and telephone receipts in 1906-7 were £4,295,790; expenditures, £4,895,286. The post-office receipts and expenditures in 1906-7 were, respectively, £17,125,817 and £16,583,000.

JOINT-STOCK COMPANIES, BANKS, ETC. In 1907 there were registered in the United Kingdom 5,265 joint-stock companies, with a nominal capital of £137,907,836. The total number of joint-stock companies (including banks) on the register April 30, 1908, was 45,304, with a paid-up capital of £2,123,492,957. At the end of 1907 the postal savings banks of the United Kingdom had 10,692,555 open accounts, the amount due to depositors being £157,500,077, an average of £14 14 s., 7d. to each account, against an average of £15 1s. 11d in 1906. Trustee savings banks in the United Kingdom had, at the end of 1907, 1,782,252 open accounts, the amount due to depositors being £52,153,595, an average of £29 5s. 3d. to each account. The amount cleared at the London bankers' clearing house in 1907 was £12,730,000,000, against £12,711,000,000 in 1906, and £12,288,000,000 in 1905.

FINANCIAL DEPRESSION in 1908. During 1908 there were 10,196 failures, against 9,606 in 1907. Unemployment was widespread, particularly in the engineering, shipbuilding, and building trades. Toward the end of 1907, the number of unemployed skilled workers was estimated by the officials of the General Federation of Trade Unions in Great Britain at 500,000, and of unskilled, at 1,000,000. This number increased during 1908. At the end of November, 1908, 268 trade unions, with a membership of 644,770, reported 58,349, or 9.1 per cent., out of work. This denoted an improvement over the end of October, when the same unions reported 9.5 per cent. unemployed, but compared with 5.0 per cent. at the end of November, 1907. The percentage of indoor and outdoor paupers in England and Wales in March, 1908, was 2.31, against 2.27 per cent. in March, 1907; at the end of June, 1908, it was 2.20, against 2.18, on the same date in 1907; and at the end of November, 1908, it was 2.34, against 2.25 in 1907. The general distress was aggravated by a lockout in the Lancashire cotton mills, lasting over seven weeks and involving 100,000 workers. It

was due to a proposed reduction of wages, and was compromised by postponing the date on which the reduction is to take effect. The mills were reopened on November 9 (See **STRIKES and LOCKOUTS.**)

FINANCE. The revenue (receipts into Exchequer) and expenditure (issues out of Exchequer, exclusive of expenditures not chargeable against revenue) of the United Kingdom for the year ending Mar. 31, 1908, were £156,537,689 and £151,812,094 respectively. The principal divisions of revenue and expenditure were as follows:

Revenue	1907-8
Customs	£32,490,000
Excise	35,720,000
Property and income tax	32,380,000
Estate, succession, etc., duties	19,070,000
Land tax	730,000
House duty	1,980,000
Stamps (exclusive of fee and patent stamps)	7,970,000
Post office	17,880,000
Telegraph service	4,255,000
Crown lands (net receipts)	520,000
Suez Canal dividends	1,189,411
Fee and patent stamps	1,024,000
Miscellaneous	1,184,278
Expenditure	1907-8
National debt servicers	£29,500,000
Civil list	470,000
Annuities, pensions, courts of justice, etc.	1,501,714
Civil Administration	30,180,000
Payments to local taxation accounts	11,155,380
Army	27,115,000
Navy	31,141,000
Charges for collection of revenue	3,222,000
Post office and telegraphs	17,527,000

The budget for 1908-9 estimated the revenue at £154,350,000 and the expenditure at £154,109,000. The total national debt on Mar. 31, 1908, stood at £759,826,051, including permanent debt, £625,608,890; estimated capital of terminable annuities, £39,407,575; unfunded debt, £43,959,400; other capital liabilities, £50,850,186.

ARMY. The military forces were reorganized in 1908, by an Act of Parliament known as the "Territorial and Reserve Forces Act." The British army formerly consisted of the regular army and the "auxiliary forces," which latter included the militia, yeomanry, and volunteers. Under this act the military forces consist of the "regular" and the "territorial" armies. The regular army is recruited by voluntary enlistment, the term of service being 7 years with the colors and 5 years in the reserve, except in the cavalry, where it is 8 years with the colors and 4 with the reserve. The territorial army came into existence by permission of the above named act, at the beginning of the fiscal year 1908-09, and includes the old organizations known as the Volunteers and Yeomanry. Recruitment is by voluntary enlistment of men between 27 and 35 years of age, the term of service being four years, with the privilege of reënlisting up to the age of 40. The militia ceased to exist as such on Jan. 15, 1908, and nearly all of its 124 battalions were incorporated into the regular army as 3d, and, in some cases, 4th battalions of line regiments.

The annual training required is not more than 15 or less than 8 days, the remainder of the training being left to the organizations concerned and carried out in the men's own time, as was previously the case with the volunteers. The territorial army is organized into units

similar to those of the regular army, and the men are paid the regular army rates when called into service. The general officers are responsible to the Army Council for the efficiency of their commands, but the administrative functions are entrusted to "County Associations," which bear the same relation to the territorial army that the War Office does to the regular army. That is, the County Associations are provided by the War Office, with a certain amount of money based on their estimates, and are charged with the raising, maintenance, and equipment of their respective contingents of the territorial army, and the care of reservists and discharged soldiers.

On mobilization the units which are to take the field are brought up to the war strength from the reserves, and at the same time all reserve units are brought up to full strength as a supplementary reserve to supply losses in the field army. The territorial army is also mobilized and is then given a period of six months' training, when it is supposed to be efficient as a home defense army.

In 1907 the regular army numbered 251,373 officers and men, of whom 123,762 were at home and 127,611 were stationed abroad; the army reserve, 128,964; militia, 99,173; yeomanry, 25,543; volunteers, 252,791, making a grand total of 757,864. The distribution of the standing army of the British Empire in 1908-9 was as follows: United Kingdom, 133,189 officers and men; Gibraltar, 3,874; Malta, 7,639; Cyprus, 123; Egypt, 5,787; South Africa, 16,450; Mauritius, 1,418; Sierra Leone, 2,576; Bermudas, 1,330; Jamaica, 1,061; Ceylon, 1,186; Singapore, 2,355; Hongkong, 4,256; North China, 2,001; British India, 234,126 (157,518 natives); not designated, 1,752; giving a grand total of 419,123, exclusive of about 40,000 native troops in the colonies of East and West Africa under the orders of the Secretary for the Colonies. Exclusive of the native Indian army, there are comprised in this total 152,913 infantry, 20,528 cavalry, 30,690 field artillery, 18,674 fortress artillery, 9,684 engineering corps, besides the transport, medical, and other auxiliary corps.

The peace strength of the regular army, exclusive of India, for the fiscal year 1908-9, is 185,000 men, of all grades and classes. The total actual strength of the regular and territorial armies, with their reserves, including regular forces in India, is 739,045 men, about 60,000 less than the authorized strength. The budget carried 27,459,000 pounds sterling for military purposes in 1908-9. The British army in 1908 adopted a new pattern of cavalry sword, a longer bayonet for the rifle, and an improved pack in two parts, so as to limit the weight carried in battle to the necessities of the firing line; and carried on experiments looking to the adoption of motor wagons for transportation service.

NAVY. In 1908 the effective navy stood as follows: 62 first-class battleships, 909,450 tons; 2 second-class battleships, 19,050 tons; 38 armored cruisers, 475,450 tons; 37 protected large cruisers, 208,190 tons; 49 protected small cruisers, 153,340 tons; 8 unprotected small cruisers, 8,610 tons; 24 gunboats, 10,885 tons; 147 destroyers, 64,370 tons; 42 torpedo boats, 7,063 tons; total, 409 ships of 1,928,388 tons, besides 47 submarines. The crews numbered 151,540. The increase in tonnage during 1907 was 112,108. There were in construction 6 battleships, of 123,300 tons, and 5 armored cruisers, of 82,-

From "Cassier's Magazine"

BRITISH BATTLESHIP "DREADNOUGHT"

200 tons. The number of convertible cruisers was 22, ranging from 32,000 to 6,400 tons each.

On Sept. 10 was launched the battleship *St. Vincent*, the fourth of the improved *Dreadnought* type. The launching weight was about 7,000 tons, and the vessel, whose keel was laid on Dec. 30, 1907, was expected to be completed in Dec., 1909. The battleship *Bellerophon* of 18,600 tons, which was launched on July 27, 1907, had its steam and gun trials toward the end of the year 1908 and was commissioned in December of that year.

The year was one of considerable activity and progress in the British navy. The battleship practice was not as good as had been expected, but a number of important improvements and innovations were in progress of development or consideration. Combined manœuvres were carried on between opposing fleets, but not under one command. There were periodical exercises in attack and defense of naval bases at Portsmouth, Portland, Plymouth, and Sheerness; and frequent exercises in the tactics of approach and deployment into line of battle. The internal combustion engine, with its many advantages for warships, received considerable attention, and the *Rattler*, an obsolete gunboat, was equipped with a vertical, 5-cylinder, single acting, suction gas engine and a producer of 500 B.H.P. Gun mountings to the number of 127, of types, Mark II, III, IV, V, and VI, were being strengthened on a considerable number of the older battleships in order that both 5-inch guns and a turret could be fired together. Improvements were also made in the gun sights, range finders, and fire control instruments, while more and stronger searchlights were being installed on account of the increased range of the torpedoes. Guns of greater power were also being developed and 12-inch 50-calibre guns were to be mounted on the newest battleships. Tripod masts were considered doomed in the British navy, and the *St. Vincent* was to have only a light signal mast. Refrigerating plants were being installed in all the new battleships to keep the magazines at a uniform low temperature, while oil fuel was being used as an adjunct to coal.

Naval matters aroused unusual interest and discussion in 1908, and it was asserted by many that Great Britain feared that the German fleet was to be used against her. Some English critics even went so far as to assert that Germany had a well matured plan of invasion; that the invasion would come as a "bolt from the blue" in time of peace; that the German foreign office already had an official note to the Powers ready, defending the necessity of such an attack; that the favorite toast of German naval officers afloat is "The Day." Numerous articles have been written, and speeches made, in England, on the possibility of invasion. Criticisms of the building policy of the British Admiralty compelled the Prime Minister, Mr. Asquith, to define the "Two Power Standard" as: "A fleet of capital ships equal to a combination of the next two most powerful foreign fleets, with an additional margin of 10 per cent. as a factor of safety." A certain school of critics insisted that Great Britain was falling below the two power standard. One well known writer refused to consider any ships but those of the *Dreadnought* type; and insisted that seven capital ships must be laid down immediately. Sir

William White, for many years Director of British Naval Construction, showed very clearly, however, that these hysterical outbursts were without foundation; that England was much stronger than the two power standard; and that there was no danger of her losing this position in the next few years. The German Chancellor, Prince von Bülow (see GERMANY, section on *History*), attempted to allay the fears of Great Britain with the assurance that the German navy is not being built for aggression; that it is solely for coast defense, and the protection of commerce. He stated on Dec. 10th, 1908, that Germany would not embark on any fresh naval proposals. But England could not forget the words of the German Emperor: "The future of Germany lies on the sea"; or his telegram to the Russian Emperor, directed: "From the Admiral of the Atlantic to the Admiral of the Pacific"; or his statement, in a now famous interview, that his country is "unfriendly" to England. England's treaty with Japan permitted her to withdraw all her battleships from the Far East, and concentrate them at home, except four in the Mediterranean. See *Foreign Affairs; Government*.

Dover was completed as a great naval base; and Rosyth, on the Firth of Forth, was being developed.

GOVERNMENT. King Edward VII., born Nov. 9, 1841, ascended the throne Jan. 22, 1901. At the end of 1908 the Cabinet consisted of the following members: Prime Minister and First Lord of the Treasury, Herbert M. Asquith, assumed office April 5, 1908, in succession to Sir Henry Campbell-Bannerman, resigned; Lord High Chancellor, Lord Loveburn; Lord President of the Council, Viscount Wolverhampton; Lord Privy Seal, Earl of Crewe; First Lord of the Admiralty, Reginald McKenna; Secretary of State for Home Affairs, Herbert J. Gladstone; Secretary of State for Foreign Affairs, Sir Edward Grey; Secretary of State for the Colonies, Earl of Crewe; Secretary of State for War, Richard Burdon Haldane; Secretary of State for India, Viscount Morley of Blackburn; Chancellor of the Exchequer, David Lloyd George; Secretary for Scotland, John Sinclair; Chief Secretary to the Lord Lieutenant of Ireland, Augustine Birrel; Postmaster-General, Sydney Buxton; President of the Board of Trade, Winston Spencer Churchill; President of the Local Government Board, John Burns; President of the Board of Agriculture and Fisheries, Earl Carrington; President of the Board of Education, Walter Runciman; Chancellor of the Duchy of Lancaster, Lord Fitzmaurice; First Commissioner of Works, Lewis Vernon Harcourt.

HISTORY.

SPEECH FROM THE THRONE. Parliament was opened on Jan. 29. The speech from the throne referred to the peaceful relations with foreign nations and to the course of international affairs during the year. As to the issues that were still pending, it declared that the relations between Mussulmans and Christians in Macedonia had not improved, and that the Powers had agreed to present a scheme to the Turkish government for the improvement of the Macedonian judiciary; that it was to be hoped that the negotiations between the Belgian government and the Crown over the Congo Free State would result in according to the Free State a humane administration; and that negotiations

were taking place with the United States for reference to the Court of Arbitration at The Hague of the international fisheries question. As to domestic affairs, bills were promised on the following subjects: Old Age Pensions; amendment of the Licensing Law in England and Wales; amendment of the Elementary Education Law in England and Wales; regulation of underground labor in coal mines; amendment of the acts dealing with the housing of the working classes, and regulation of the laying out of land in growing urban centres; amendment of the existing system of property valuation in England and Wales for the assessment of government charges; improvement and extension of University education in Ireland; amendment of the Irish Land Purchase Act of 1903; establishment of authority for control over and improvement of the port and waterway of London; amendment and consolidation of the law for the protection of children and the treatment of juvenile offenders; and the re-introduction of the bills relating to Scottish land and valuation.

MINISTERIAL CHANGES. Sir Henry Campbell-Bannerman, who had been Prime Minister since 1905, resigned on April 5, 1908, on account of long-continued illness and was succeeded by Mr. Asquith, whose reorganization of the Ministry consisted chiefly in the promotion of younger men to important places in the Cabinet. Mr. Lloyd-George succeeded him as Chancellor of the Exchequer; Mr. Reginald McKenna became First Lord of the Admiralty; Mr. Winston Churchill, President of the Board of Trade; and Mr. Walter Runciman, President of the Board of Education. All these were young men who had distinguished themselves in their former positions. The other chief members of the reconstituted Ministry were as noted above under *Government*. The resignation and subsequent death of Sir Henry Campbell-Bannerman (q. v.) left Mr. Asquith the leader of the Liberal Party. His talents were of a different order from those of his predecessor. He lacked Sir Henry Campbell-Bannerman's ingratiating personality, and did not approach him in popularity but on the other hand was remarkable as a keen and effective debater and party fighter. Of the measures mentioned in the speech from the throne, the three which absorbed the main attention of the new government during the year were the Old Age Pension Bill, the Education Bill, and the Licensing Bill. In spite of the vigorous fight which the new Ministry made for them, only one of these measures was carried during the year, namely, the Old Age Pension Bill. But since the other bills consumed the greater share of attention both in and out of Parliament, it is desirable to discuss them in some detail.

OLD AGE PENSIONS. For several years a proposal for old age pensions had been under discussion, and both parties were committed to a measure of some kind on this subject. It owed its place as an issue in practical politics to Mr. Joseph Chamberlain, who, however, at first favored the German model, which required the recipient to contribute. Strong arguments were brought against this feature of compulsory contribution. It was urged, for example, that owing to the low wages of a large class of workingmen, many of those who were most in need of pensions would be excluded, and that the more independent spirit of the British working-

man would make the application of such a rule more difficult than in Germany. Charles Booth favored the non-contributory plan and Mr. Chamberlain was finally won over to it. There had been much discussion of the subject during the Conservative Ministry, 1895-1906, but nothing practical had come of it, although many of the Conservatives were in favor of an old age pension scheme. In 1907 Mr. Asquith announced that in the following year a scheme would be submitted. This was the first definite promise on the subject, and it was renewed in the speech from the throne. The Old Age Pension Bill was introduced by Mr. Lloyd-George toward the end of May. There was no effective opposition to it, and it passed both Houses and received the royal assent Aug. 1. For the provision of the bill, see **OLD AGE PENSIONS**. The measure aroused great apprehension lest the requisite funds could not be found, and it was urged against it that no backward step could be taken, and that the burden would constantly increase. As a matter of fact, the Labor party subsequently declared in favor of reducing the pension age to 65 years. It was also condemned in many quarters as establishing a dangerous principle that would tend to make people depend too much on the state and, in the end, pauperize the community. Many clung to their belief in the contributory system, arguing that without that feature thrift would be discouraged and the number of idle persons increase. To this it was replied that few of these idlers would reach the age of 70, an age which was seldom attained by any but the sober and industrious among the working classes, and that instead of discouraging thrift, it would rather encourage it by taking away the hopelessness of labor, the tendency to view the workhouse as the necessary end in any event. The proposal for compulsory contribution was voted down in Parliament by a majority of 417 to 29. It was the most extensive experiment in this field that had yet been made among Western nations. The Liberal party, in justifying the introduction of the bill at this time, pointed to the satisfactory condition of the finances which had resulted from their administration. During his first two years as Chancellor of the Exchequer, Mr. Asquith had striven to restore the national credit, which was burdened by the South African war loans, and especially to reduce the national debt. He estimated that by the close of the year £40,000,000 of the debt would have been paid off, and the interest reduced by £1,250,000. He had put an end to the practice of meeting the expenses of the army and navy out of loans; had reduced the army and navy costs; removed the duty on coal, as well as some other slight duties; and rendered the income tax more popular by discriminating between the earnings of labor and those of capital, that is to say, diminishing by one-fourth the rate on the earnings of labor. The Liberals pointed to the fact that the credit had improved and at the same time the return from taxation had increased. From the income tax the returns had exceeded the budget estimates by £1,800,000, which looked for a loss as the result of reducing the rate of the income tax on wage earnings. This year £1,200,000 could be applied to old age pensions. As the law did not become effective until January 1, 1909, the government would not have to provide in that budget for a complete year of pensions.

RT. HONORABLE REGINALD MCKENNA
FIRST LORD OF THE ADMIRALTY

EDUCATION BILL. During 1907, Mr. Reginald McKenna, then President of the Board of Education, did his best to administer the law in the spirit of the rejected education bill of 1906, modifying, for example, the rules in regard to subventions to normal schools under Anglican control, and preventing pupil teachers from being subjected to religious tests. On Mar. 24, after a speech by Mr. McKenna and a debate, the new education bill was read for the first time. The arguments for it and the explanation of its main provisions may be briefly summarized as follows: The measure was not a duplicate of the 1906 bill which had been killed in the House of Lords. The main problem was how to establish firmly the principle of public control of public elementary schools without religious test for teachers and at the same time do justice to existing institutions with their diverse traditions, hopes, and beliefs.

The new bill provided that there should be only one type of public elementary school controlled by the government and without any religious test for teachers. Each public elementary school should be a County Council school and there should be no compulsory attendance on any other kind of school; religious instruction to be the same as it had been in the Board and County schools for the past 38 years. Although the Liberal argument for the complete secularization was probable, Mr. McKenna pointed out that it did not meet the wishes of the public, for parents desired religious instruction for their children and were opposed to a purely secular system. Moreover, many wished more definite denominational teaching than was given in the county schools. Hence it would be regarded as an injustice if the government did not recognize voluntary schools. It was felt that generous treatment might properly be accorded to these schools, attendance upon them not being compulsory. Therefore the government recognized the voluntary schools. But if they were to receive public grants they must conform precisely to the educational standard of the county schools; the average attendance must be not less than 30; no rate aid should be given to them; and they should not be recognized in single school parishes. The new bill would bestow on each educational area 4s. per child more than at present and it was estimated that the additional benefits would cost the government £1,400,000. The cost would be 47s. per child in both public and voluntary schools. No educational area should receive more than 75 per cent. of the whole cost of elementary education. Provision was made for the transfer of voluntary school buildings which the trustees would not maintain. If "tight trust" rural schools continued, it must be out of private resources. If the school was taken over, the local educational authority was to carry on the educational part of the trust by giving elementary education five days in the week and the denominational part of the trust might be carried on independently on Saturdays and Sundays and out of hours on other days. The local authorities were to keep up the school buildings, supply the heating, lighting, furniture, etc. Cowper-Temple teaching might be made a condition of transfer. The provision as to denominational teaching out of hours should apply only to single school districts, because in

others such teaching could be given in the voluntary schools.

The bill was read a second time on May 20, but it was evident to the government that it could not be passed in its present form and negotiations were undertaken with the church authorities to arrange a measure that would serve as a compromise. After the rejection by the House of Lords of the Education Bill of 1906, owing to the opposition of the Anglican Church to that measure, the Episcopate showed a willingness to admit a compromise, feeling that concessions would be required sooner or later, and that it was better to make them with a good grace than under compulsion. The Archbishop of Canterbury said that he felt bound to admit, though with reluctance, that religious tests for teachers were indefensible. The latter point, however, was sharply debated, for many of the clergy refused to release teachers from all religious requirements. The reformers contended that as teachers were paid out of the public funds, they should no more be subjected to this test than any other civil servants. The Bishop of St. Asaph brought in a bill which agreed with Mr. McKenna's measure in guaranteeing local control and suppressing religious tests for teachers. During the summer, while Mr. Runciman was preparing the compromise measure, discussion lapsed.

On Nov. 19, Mr. Asquith announced that as a result of these negotiations, the government would introduce a new measure which, although it did not contain all the objects desired, would, he believed, offer a solution which all parties concerned could accept. The main provisions of the new bill were as follows: The two essential points of the previous measure were retained, namely, that only the schools provided by the local educational authorities should receive rate aid and that no religious tests should be imposed upon teachers. Religious instruction should be provided by the authorities within the first three quarters of an hour of each school day for children whose parents desired it, but the authorities are to bear no part of the cost. Free accommodation must be provided by the authorities for all children whose parents required it. Attendance was not to be compulsory at any school not provided by the local authorities. Any person approved by the parent may give this denominational instruction and any teacher may do so with the consent of the authority. No grant shall be made to a non-provided school in any single-school district, or unless it has an attendance of at least thirty pupils. It is moreover required to attain the same standard of efficiency as the non-provided schools. Voluntary schools may be transferred to the legal authorities by agreement, provided their use suffices for the purpose of public elementary schools. If the owners of the voluntary schools cannot or will not carry them on as certified efficient schools, the Board of Education may order their transfer to the local educational authorities.

DISCUSSION AND FATE OF THE MEASURE. In the course of the prolonged discussion of this measure, its opponents argued that it was in no sense a compromise, because it did not settle the question; that the Church of England could not approve it, and that all Roman Catholics were opposed to it; that the transfer of the Anglican schools would arouse bitter feeling,

over £1,000,000 having been subscribed to them since 1902; that "contracting out" would cause difficulties—the Parliamentary grants to denominational schools for "contracting out" not sufficing to place them on the same footing with others; that there was no prospect of securing by these means the peaceful solution at which the government aimed. On the other hand it was said that if the Act of 1870, which was a compromise, had kept the peace for twenty years, there was reason to think that the present measure would bring about a like result. There had been ten years of educational warfare, and now a measure was proposed to which the parties concerned would probably agree. "Contracting out" was already practised in Scotland, and was recognized by the Catholics. The Scottish grant per Catholic child was only fourteen shillings, whereas the English grant according to the present bill would be fifty shillings. As to the Non-conformist interest, the government pointed to the fact that the bill provided for complete public control and for untested teachers when rate aid was given, and for the complete rejection of rate aid for sectarian teaching. As to the Anglican Church, the government pointed to the right to give dogmatic teaching in provided schools, and to the fact that in single school districts the Church could establish her own schools with liberal state aid. Further negotiations were carried on between the Ministry and the Anglican Church authorities, in order to reach an agreement but on Dec. 7, the bill was withdrawn, Mr. Asquith announcing that agreement on its features had not been attained. The principal point of disagreement with the Archbishop of Canterbury was the question of "contracting out," and the Prime Minister declared that there was no prospect of an understanding on that point at present. The government could not consent to increase the financial provision, as that would add greatly to the number of schools which would take advantage of the "contracting out" clause.

Meanwhile the Church Council which had recently assembled had decided that the bill could not be accepted without serious amendment. Mr. Balfour criticised the government for not having first made sure that the Church would accept their proposal. The government, he said, knew that it was a compromise, and that it did not satisfy the ideals of the Liberals. It should have obtained the agreement of the Bishops at every stage in the framing of the measure. On the other hand it was rushed through the House by the aid of closure. The government had called the financial parts of the bill mere details, whereas the Church regarded them as vital to any settlement of the question, the Archbishop having repeatedly pointed out that the financial proposals as to "contracting out" and as to the transfer of schools were not details that could be left to subsequent agreement, but were of the very essence of the problem to be solved. This was the fourth failure of the government to settle the educational question, and much disappointment was felt, for there had been during the year signs of a conciliatory spirit. Mr. Runciman was commended for his zeal and open-mindedness. When the fate of the measure was still in doubt, a Settlement Committee was formed, in order to rally public opinion in favor of a compromise; and at the time of its

withdrawal there was evidence in the country of a willingness on the part of the opposing interests to concede something for the sake of a solution. Though the failure of the measure was regarded as a signal defeat of the Liberal party, it was felt that certain points which must form parts of any future settlement had been clearly established, namely: That the Anglican Church should have the right of entry into schools and that there should be complete local control, and no religious tests for teachers.

THE LICENSING BILL. Another measure to which the Liberal Party was committed was the amendment of the existing licensing law. The new measure was introduced at the close of February. Its two chief objects were explained by Mr. Asquith at that time (Feb. 27) as the "immediate and progressive reduction of the excessive facilities now given for the retail sale of intoxicating liquor, and the gradual and complete recovery by the State of its dominion over a monopoly which it had imprudently permitted to slide out of its control." It provided for compulsory reduction of licenses within a period of fourteen years, upon a uniform scale based on the ratio between licenses and population. Thus where the density of population was two persons per acre, licenses were not to exceed one for 400 persons; between 2 and 25 per acre, the maximum was one license for 500; between 25 and 50 per acre, one for 600; between 50 and 75 per acre, one for 700; for more than 200 per acre, the maximum was one for 1,000. Exceptions were made of hotels, railway stations, business quarters of great towns, etc.

It was estimated that from 30,000 to 32,000 licenses would be suppressed, a little more than one-third of the total number. There was to be compensation for withdrawal of licenses, but it was to come from a tax levied on the trade. At the end of the reduction period of fourteen years, the licenses in excess of the limits above mentioned should cease altogether; but as a concession to the temperance cause, power was given to the local authorities to reduce them further if they desired. At the expiration of the reduction period, no further indemnity was to be paid. During this period there was to be a licensing commission of three persons, to be paid out of the compensation fund. The Justices were to be retained as licensing authorities, except in large boroughs where there were committees and authorities of special appeal. The parochial electors were to have the right to prohibit the granting of new licenses. The licensing authority must at an early date prepare a scheme for reduction, and when this is approved by the central authorities must select the licenses for extinction.

Other features of the licensing bill were: Annual registration of clubs; right of inspection of clubs on the part of the superior police officers, but not in uniform; metropolitan public houses to be opened only one hour in the middle of the day on Sundays, and only two hours in the evening; regulations as to the exclusion of children, the employment of women, etc. According to the existing system, which this measure was to modify and in part supersede, licenses are issued at the discretion of the local authorities, who sometimes go to one extreme and sometimes to the other, but on the whole have permitted, according to

Courtesy of the "Review of Reviews"

RT. HONORABLE HERBERT H. ASQUITH
PRIME MINISTER AND FIRST LORD OF THE TREASURY

prevailing opinion, the opening of an excessive number of drinking places. For some years past the temperance movement has been growing rapidly, and even among the classes whose views are not at all extreme a material reduction of licenses has been demanded. The local authorities long since perceived this, and they themselves in response to public feeling took measures to reduce the number of licenses. The principle of compensation has never been recognized by law. The local authorities might recall licenses arbitrarily and without indemnity. Down to 1904 the local justices who were the licensing authorities could revoke licenses without indemnity.

During the last ten years the liquor trade in great Britain has greatly altered. The earnings of the breweries have been enormous, and there has been fierce competition among them. In order to assure the sale of their beers, the breweries have followed the policy of buying up all the available licenses and turning them over to the retail dealers, who were bound to their respective interests and must sell their beers. Owing to the sharp competition, these licenses were purchased at an exorbitant price. By the year 1900 the brewers had acquired a large number of the retail shops, which they had purchased at prices far in excess of their actual value; although during this same period the temperance movement was gathering strength and the local authorities were manifesting a tendency to reduce licenses, and although no indemnity was granted for withdrawals. In these circumstances the brewers naturally pressed for compensation in case of the revoking of licenses, and they partially realized their aim in the act of 1904, which was passed by the Balfour ministry. This forbade the recall of a licenses without indemnity, but the indemnity was to be supplied by a tax on the surviving members of the trade, that is, on those retailers whose licenses were not withdrawn. The main objection against this law was that it did not permit a sufficiently rapid reduction; because, owing to the limited supply of money from this source, only a small number of licenses could be recalled. It was opposed by the Liberals and by moderate reformers like the Archbishop of Canterbury and many of the Bishops. For some time past the Liberal Party had been expected to submit a scheme of license reform.

The main subject of contention in the new measure above outlined was the reduction period of fourteen years. The dealers declared that the state was robbing them of their reasonable expectation of profits, and this view was taken generally by the Opposition, who moreover asserted that it would not reduce intemperance materially and had no advantages which could offset the confiscatory feature. The brewing interests were naturally solid against it. A vast number of investors were concerned, and a large decline in the shares of breweries took place. The matter was violently discussed in Parliament and in the press. Thousands of electioneering rooms were opened and canvassers were sent out by the breweries. Mr. Balfour condemned the bill as a measure of confiscation and as tending to promote secret drinking in clubs. It was remarked by a leading English newspaper that if it became a law the incomes of many peers would be cut in two. A great many of the brewing companies

were in bad financial condition, their shares having greatly declined owing to the excessive purchase of licenses at high prices; and it was urged that to oblige them to liquidate within the reduction period would mean their ruin. A large amount of money was spent in the campaign against the measure. On the other hand, not only the temperance reformers but more moderate assailants of the drinking evil were active on its behalf. As to the charge that it was a confiscatory measure, the government pointed to the fact that licenses had never been considered property and that they had been revocable without indemnity till 1904. The Conservatives themselves had in the Act of 1904 admitted the principle that whatever compensation there should be must come from the trade.

In the course of a debate in October, Mr. Asquith defended the principle of a time limit. The State, he said, had given the licenses a high value, and license holders had formed the habit of thinking that as licenses had been renewed in the past they would continue to be renewed indefinitely. The law, however, had given no warrant for this expectation, and it could not be admitted that this monopoly value was property in the full sense. A time limit was essential, and he believed the fourteen-year period met all the requirements of justice, but he was willing to "entertain the suggestion that for a short term of years following the fourteen years, when an old license was re-granted, it would be re-granted without attaching to the regrant, as a condition, a surrender of the monopoly value." Later this secondary period was fixed at seven years.

The bill passed the House of Commons on Nov. 20. It was immediately taken up in the House of Lords. Among the objections that were urged against it were that while it dealt most unfairly with the vested interests of the liquor trade, it did not offer any evidence that it would actually reduce intemperance; and also that the Act of 1904 should have a longer trial. Finding that the Lords were on the point of throwing out the measure on the second reading, the Ministry declared that such a course was almost unprecedented, and defended the provisions as to compensation and as to the time limit, saying that sooner or later the State would resume the right to refuse licenses without regard to any vested interests. The bill was defeated by 272 votes against 96 on its second reading, Nov. 27. The result showed that popular opinion was not ready for a measure which dealt so severely with the liquor interests, and threatened so great economic disturbance. The view generally taken was that licensees and investors should be more fairly treated. In addition to many other manifestations of disapproval, a large meeting was held in London under the presidency of Lord Rothschild, comprising important business men, which protested against such an attack on credit and on the great network of industries. There had also been a mass meeting of protest at Hyde Park in September. All the bishops in the House of Lords supported the measure.

Commenting in December on these two great defeats of the ministry (the Education Bill and the Licensing Bill), Mr. Asquith contrasted the attitude of the Lords toward these meas-

ures when put forward by the Liberal party to their attitude toward measures fathered by the Conservatives. He said the present system enabled the leader of the defeated party to decide through the House of Lords what laws should be and what laws should not be passed, and he asked if this state of affairs was to be permitted. He urged the Liberal Party to make the question of the House of Lords' veto the leading issue in their programme. To those who advised a dissolution, he replied that to dissolve Parliament merely because the Lords opposed the party's measures was absurd, and he believed unprecedented. He deprecated especially the action of the Lords in rejecting the measure before they heard any explanation of its provisions.

The government's defeat in these instances showed that the Asquith Ministry at the close of the year was in a weaker condition than the Campbell-Bannerman Ministry at the beginning. There was no sign that the country was stirred on their behalf. On the contrary, the by-elections generally indicated that the Liberals were losing public confidence. Some of their proposed measures were, however, carried through successfully. The most important of these were: The Irish University Bill, the Coal Mines Eight Hour Bill, the London Port Bill, and the Agricultural Land Value Bill (Scotland).

COAL MINES EIGHT HOUR BILL. This limited the time of miners underground to eight hours a day, and provided for an inspector in every colliery to decide on the amount of time necessary for raising and lowering the miners to and from their work. The opposition that it encountered rested mainly on economic grounds. It was alleged that a great increase in the price of coal would follow; and it was also urged against it that the miners themselves did not desire it. There could not have been much sincerity in the latter contention, however, since the bill was passed by a two-party vote, which would not have been the case if it were not demanded by the people at large.

THE PORT OF LONDON BILL. This established a new port authority, to consist of a body of 25 members, of whom 15 are to be elected by the trades and industries concerned, and 10 appointed by the Admiralty, the Board of Trade, the London County Council, the Corporation, and Trinity House. To this body is transferred the revenue of the Thames Conservancy, and it will have power to impose new duties. Its duty is to take steps for the improvement of the port facilities. A measure looking to this end had been presented by Mr. Lloyd-George, when he was head of the Board of Trade, the need of transferring to a public society the control of the board being apparent from the failure of the existing company to make the necessary extensions and improvements.

AGRICULTURAL LAND VALUE BILL (SCOTLAND). In the previous session the House of Lords had rejected two land measures affecting Scotland; the first bill aiming to assure small farmers security in their lands, and the second, the present bill for land valuation, which establishes bases of valuation for the land tax on property which was not built on. In 1908 the Ministry succeeded in putting through the second measure, modified in accordance with suggestions from the Lords. It provided for a separate valuation of the unimproved lands, in

order to lighten the financial burdens as regards buildings, and further the solution to some degree of the city housing problem. The Small Land Holders Bill, for the encouragement of small agricultural holdings in Scotland and the improvement of their tenure, was again rejected in 1908 by the House of Lords (Mar. 11).

CHILDREN BILL. This was a measure of wide scope, including provisions on the subject of cruelty to children, juvenile smoking, the right of entry into homes for destitute children, the segregation of juvenile offenders from adult criminals, separate courts for juvenile offenders, sale of intoxicating liquor to children, etc. It forbade the sale of cigarettes to persons under sixteen years of age, and prohibited such persons from smoking in public places; it imposed fines on anyone giving intoxicating liquors to children under the age of five.

DISCUSSION OF NON-EMPLOYMENT. An Unemployed Workman Bill was introduced by the Independent Labor party and debated in the House, the point at issue being a clause requiring the local authorities to find work for applicants, and to supply them with the means of living if work could not be had. It was opposed as introducing a novel and harmful principle, and rejected by a large majority on March 13. The Socialist members supported it, but the Labor members were divided upon it. The question of employment was very urgent during the year. In October the Trade Union returns showed that 9.5 per cent. of their members were idle, as against an average of 4.8 per cent. for the preceding seven years. The local Distress Committees established by the Unemployed Act of 1905 for carrying on the work of relief dealt during the year ending March 31, 1908, with over 30,000 applications for aid. The London committee declared in its report that a three years' trial had shown that the problem of unemployment could not be dealt with locally, and that the question must be taken up in Parliament. Mr. Asquith, speaking in the House of Commons on Oct. 21, admitted the gravity of the situation, but declared that through various departments and local authorities it was proposed to expend nearly £3,300,000 on various public works, so as to afford increased opportunities for employment.

IRISH UNIVERSITY ACT. This provided for the chartering of two new non-sectarian universities, at Belfast and Dublin, and for the closing of the Royal University. The constituent colleges of the Dublin University are Queens College, Belfast; Queens College, Cork; Queens College, Galway; and a new college at Dublin. No religious tests of any sort are permitted. A body of ten commissioners is placed in charge of the Dublin institution, and a body of seven in charge of the Belfast. The Irish Nationalists and Bishops desired an amendment permitting the building of places of worship within the University grounds, and were much incensed by its rejection in Parliament. Parliament is to grant the sum of £74,000 annually to the constituent colleges of Dublin University. For extraordinary expenses a sum not exceeding £170,000 may be appropriated. Though nominally non-sectarian, the new Dublin University is in reality the Catholic University for which the Irish Roman Catholics had long been struggling. This will be brought about in the natural course of events by the abolition of the religious test, just as Belfast University must be virtually a Prot-

stant university under the same conditions. It had long been the standing complaint of the Roman Catholics that higher education was practically closed to them in their own country, by a system which made it impossible for a conscientious member of their church to study at Dublin. The justice of their contention had been admitted even by Mr. Balfour, who nevertheless maintained that he was helpless in the face of religious bigotry.

THE IRISH QUESTION On Mar. 30 a spirited Home Rule debate took place in the House of Commons, when Mr. John Redmond moved a resolution that the present Irish government was opposed to the will of the Irish people, was inefficient and extravagant, caused universal discontent and distress, and must be reformed. The old objections to home rule had, he declared, been answered by the changes of the last twenty years under unionist government. He pointed to the good effects of the Local Government Act of 1898 as proof that the Irish could manage their own affairs; and he said that the Land Act of 1903 was a sufficient answer to those who said an Irish Parliament would confiscate landlords' property. In the course of twenty years, he said, the government had converted to home rule almost all the officials that it had sent to Ireland. An opposition amendment was moved by Lord Percy, who declared that if the Imperial Parliament gave up its undivided responsibility in the United Kingdom, it would injure alike the prosperity of Ireland and the security of Great Britain; that the argument of nationality was just as strong for separation as for home rule, and that parliamentary government had never been granted on that ground alone. Mr. Birrell, Chief Secretary for Ireland, supported the resolution in a vigorous speech, urging immediate consideration. Mr. Balfour spoke against it. Mr. Asquith said he could not vote for it, because it did not contain a specific recognition of the paramount supremacy of the Imperial Parliament. Lord Percy's amendment was rejected, but the original resolution was amended to the effect that the Home Rule Parliament must be subject to the Imperial Parliament. Thus amended, it passed the House by a majority of 156.

On Nov. 23 Mr. Birrell brought in an Irish Land Purchase Bill, which was heartily supported by Mr. Redmond on behalf of the Nationalists as a thorough measure of reform. Mr. Birrell declared that to carry out the proposals as to land purchase £52,000,000 were required for pending agreements and £100,000,000 more would be needed in the future.

THE NEW PATENT LAW. Aug. 28th was the day fixed by the Patent Law of 1907 for the expiration of the year of grace allowed to foreigners. The law provided that if, at the end of that period, the article or process protected by patent in Great Britain had not been manufactured or operated in that country to an adequate extent, the patent might be revoked after a reasonable interval. This provision was designed to put an end to the practice of foreigners of taking out English patents for a new process which they employed abroad, but did not employ, except to a nominal degree, in Great Britain. They thus prevented their British rivals from using the process, although they themselves did not use it in the country. In some instances they had not used it at all, but had resorted to this device in order to prevent others

from superseding their methods. The effect of the law was said to have already been beneficial, compelling many to start up manufactures of patented articles in Great Britain, and a great increase of production was expected, and an increased employment of British workmen. In Germany, however, there was complaint that the new provision bore heavily upon the German manufacturers. The subject was much discussed during the summer. It was brought up at the Trade and Patent Congress at Stockholm, Aug. 26-30, and at the International Social Democratic Congress at Nuremberg, and the Trade Union Congress at Nottingham in September. At the close of the year it was reported to have led to a great increase in the British plants, many foreigners having either set up plants in Great Britain, or entered into working agreements with British firms.

WOMAN SUFFRAGE. The year was marked by repeated demonstrations on the part of the woman suffragists. On Jan. 18, when the Cabinet met at the Premier's residence in Downing Street to consider the King's speech, women thronged around the building, shouting "Votes! votes for women!" and endeavored to force an entrance but were thrown back by the police. Some chained themselves to the railings and were removed by the police only with great difficulty. Several arrests followed.

On Feb. 21 a number of suffragists attempted to force their way into the House of Commons, in order to present a petition to the Premier. Several of the demonstrators were arrested and sentenced to a term in prison. On June 13 there was a woman suffrage procession, in which the participants were counted by tens of thousands. On June 21 there was a great demonstration in Hyde Park, and on June 30 there was an attempt to "rush" the House of Commons, followed by a number of arrests. Preparations for a similar attack in October led to the arrest and imprisonment of the leaders of the militant suffragists. Mrs. Parkhurst, Miss Chrystabel Parkhurst, and Mrs. Drummond. See WOMAN SUFFRAGE.

REFORM OF THE HOUSE OF LORDS. A select committee of which Lord Roseberry was chairman, was in session from June, 1907, to December, 1908, preparing recommendations for the reform of the House of Lords. The principal recommendations contained in the report are as follows: First, that except in the case of peers of the blood royal it was undesirable that possession of the peerage should of itself give the right to sit and vote in the House of Lords, and that in future the dignity of the peer and the dignity of a Lord of Parliament would be separate and distinct. The latter would carry with it the right to sit and vote, which the former would not. Second, all hereditary peers, including those of Scotland and Ireland, should be formed into an electoral body for the purpose of electing 200 from among their number to sit and vote as Lords of Parliament, and these representative peers should not sit for life, but for a parliament. Third, the Episcopal representatives should number 10, and the two archbishops should sit by right during their tenure of office; the remaining body of bishops should elect eight of their number to represent them during each Parliament. The committee came to no definite conclusions relating to the representation of the colonies and of India, but was in favor of such representation and recom-

mended that the wishes of the countries in question should be ascertained. It was estimated that about 130 hereditary peers at present sitting in the House of Lords would be entitled to sit as Lords of Parliament under these recommendations, while the entire body would number about 350 members.

FOREIGN AFFAIRS. The press abounded during the year with expressions of alarm and hostility on the subject of German designs, and especially German naval policy. These feelings were for the moment greatly intensified by the so-called "Tweedmouth incident." The Kaiser had sent a personal letter to Lord Tweedmouth, First Lord of the Admiralty, and this fact, having been discovered by the military editor of *The Times*, was reported in that paper on March 6. It was immediately taken as an attempt on the Kaiser's part to interfere with British naval affairs. It followed the appearance of an open letter by Lord Esher in the newspapers, which demanded an increase of the naval budget in order to keep pace with the German naval programme, and it was assumed to have been written by the Kaiser as a protest against that demand. The official explanation from Berlin merely declared the letter a private one, and the Kaiser guiltless of any intention to interfere in British affairs. In the House of Commons Mr. Asquith repeated that explanation. Later, however, he said that if the German naval programme were carried out, the British government would not fail to increase the British navy sufficiently to maintain its supremacy. Lord Tweedmouth was shifted from the Admiralty to the Lord Presidency of the Council, and in September retired from the Cabinet. This alarmist spirit was again stirred in the summer time by a speech of Lord Cromer, who called on the government to provide "betimes for a European conflict, which may not improbably be forced on us before many years elapse." He declared that without questioning the honest motives of those who see only peace ahead, it must be remembered that, however earnest individuals may be in their desire for peace, national interests or race passions are liable at any time to lead to war. A third instance was a speech by Lord Roberts, pointing out in some detail the dangers of a foreign invasion of England. The subject had already been discussed extensively on the Continent, where military critics referred to the inadequacy of Mr. Haldane's army plan, which had not turned out as well as had been hoped. It aimed at a territorial army of 300,000, whereas only about 100,000 had enlisted; and it was further remarked that eight or fifteen days a year would not supply the training of soldiers; that in case of war the nation could not place sufficient trust in this army; that the regulars, moreover, were not only inadequate, but were extremely slow in mobilizing and were hardly more than sources of supply for the Colonies and India. In England itself, this view was held in certain quarters, and although conscription was hateful to the people a league had been formed to promote compulsory service. In the English press the ease with which an invasion might be accomplished had been frequently remarked, before Lord Roberts made it the subject of his serious and extended discussion. (See *Army; Navy*.) On the other hand, the *entente* with France was greatly strengthened by the visit of the French President to London (see *FRANCE, History*); and

the friendly relations with Russia, already marked by the Anglo-Russian Convention, were cemented by the visit of King Edward to Reval, where he held a conference with the Czar. The Anglo-Russian Convention had, to be sure, been sharply criticized by a number of persons, including especially Anglo-Indians, on the ground that too much had been conceded to Russia; and they continued in 1908 to regard the Russian menace as all important in Afghanistan. Lord Curzon was the chief of these critics, and his first speech on entering the House of Lords consisted of a minute examination of this agreement, with adverse comments upon it. The King's meeting with the Czar was criticized by the Socialists and certain Radicals. The King's speech on closing Parliament referred especially to the cordial feelings occasioned by the American fleet's visit to Australian waters, and to the friendly relations with the United States, as shown in the conclusion of treaties of arbitration and for the settlement of questions at issue. It declared that the main source of anxiety in foreign affairs was the Balkan question. For an account of the British policy in that matter, see the article **BALKAN QUESTION**, and as to the Congo Treaty see **BELGIUM and CONGO**, paragraphs on *History*. See also **MACEDONIA and TURKEY**.

GREECE. A kingdom of southeastern Europe. Area, 24,973 square miles. Population (1907), 2,631,952 (1,324,943 male and 1,307,010 female), against 2,433,806 in 1896. The principal cities, with their populations in 1907, are: Athens, 167,479; Piræus, 71,505; Patras, 37,724; Corfu, 27,397; Volos, 23,563; Larissa, 18,001; Trikkala, 17,809; Hermopolis, 17,773; Pyrgos, 13,690; Zante, 13,580; Calamata, 13,123; Chalcis, 10,958; Tripolis, 10,789; Laurion, 10,007.

PRODUCTION. The chief mineral products are iron, manganese iron, calamine, silver-lead, manganese, chrome, magnesite, lignite, emery, and salt. The total mineral production in 1906 was valued at \$4,105,000. Agriculture is mainly carried on by peasant proprietors and métayers, and is in a backward state. Wheat (8,000,000 bushels in 1907), barley, rye, maize, and maslin are produced. The tobacco crop in 1906 was 6,000 tons. The export of silk cocoons amounts to about \$200,000 annually. There is a considerable production of wine, olives, citrons, oranges, lemons, and figs. The wine production in 1907 was 32,000,000 gallons. The currant production of 1908 was estimated at 165,000 tons, and the shipments of currants for the season 1907-8 were about 125,000 tons. The production of olive oil in 1907 was 57,923,000 litres (1 litre = 1.0567 quarts), worth about one franc per litre. Adding the value of edible olives, the total value of the Greek olive oil crop in 1907 was about 63,000,000 francs. The crop of 1908 was reported a failure, barely sufficing for domestic needs. Figs grow mostly in the province of Messina, near Calamata, and are of poor quality. The fig crop of 1907 was 11,600 tons; of 1908, 9,000 tons. About 1,000 acres are under sugar-beets, and there is one beet-sugar factory at Lazarina, Thessaly.

COMMERCE and COMMUNICATIONS. The imports and exports in 1907 amounted to 148,393,000 and 116,049,000 drachmas, respectively, against 144,636,000 and 123,526,000 drachmas in 1906 (1 drachma = 1 franc = 19.3 cents). The leading imports are cereals, textiles, chemicals, metal

goods, timber, and living animals. The leading exports are currants, olive oil, tobacco, iron ore, wine, silver-lead ore, figs, silk and cocoons, olives, and zinc ore. The trade is principally with Great Britain, Russia, Germany, Austria-Hungary, Turkey, France, and Bulgaria. The merchant marine consisted of 255 steamers, of 266,915 net tons (1907), and 880 sailing vessels of 50 tons and over, aggregating 167,243 tons (1905). The railways had a length of over 865 miles in 1908, and the telegraph lines, 4,903 miles in 1906. The railway from Piræus to the Turkish frontier, about 270 miles, was to be completed by the end of 1908. In September, 1908, this railway was opened to Larissa, about 28 miles from the frontier. It connects with the Monastir-Saloniki line and thus puts Greece in railway communication with the Occident.

GOVERNMENT. The legislative power is vested in a single chamber (Boulé), consisting of 235 deputies, elected by manhood suffrage for a term of four years. The present King is George I., son of the late King Christian IX., of Denmark, who was elected King of the Hellenes in 1863 by the National Assembly. The Premier of the Cabinet of July 5, 1908, was G. N. Theotokis.

FINANCE. The ordinary revenue and expenditure in 1906 were 128,753,358 and 124,461,577 drachmas, respectively. The budget for 1908 estimated the revenue at 136,642,784, and the expenditure at 134,042,556 drachmas. The principal sources of revenue were estimated as follows: Direct taxes, 22,172,000; indirect taxes, 54,760,000; stamps, 14,950,000; monopolies, 13,650,000; and of expenditures: Public debt, 35,698,110; interior, 18,543,510; war, 18,628,760; marine, 8,405,176; worship and instruction, 6,850,646. The external gold debt stood on Dec. 31, 1907, at 717,582,500 drachmas; the paper debt, at 166,891,073 drachmas.

ARMY AND NAVY. Military service is compulsory and universal, commencing in the 21st and lasting until the 51st year, with the usual exemptions, except that an exemption fee or tax must be paid. The term of service is divided as follows: 2 years in the active army, and 10 years in the reserve; 8 years in the territorial army and, finally, 10 years in the territorial army reserve. The maximum strength of the peace army is 29,000 men; that of the field army about 50,000 men; and that of the reserves about 100,000 men, of all classes. The infantry had been rearmed with the Mannlicher-Schönauer rifle, model 1903, and the artillery with a new quick-firing gun, model of 1907. Reservists to the number of 30,000 were mobilized for training in 1908. The budget for 1907 was about \$4,100,000. For 1908 the effective strength of the standing army was fixed at 1,878 officers and 19,416 men; of the territorial army, 76,800. The effective navy at the beginning of 1908 consisted of 3 coast defense vessels, aggregating 15,000 tons; 1 armored gunboat, 1,800 tons; 10 torpedo boats, 675 tons. Total, 14 ships of 17,475 tons, showing a decrease during 1907 of 700 tons.

HISTORY. An important question before the government in 1908 was the reorganization and improvement of the navy. The aid of France had been assured, if Greece sought a loan for that purpose, and it was proposed that the reorganization should be effected under the direction of the French admiral Fournier. The latter's plan, however, which looked to a navy consisting mainly of scouts and submarines, was vigorously opposed, and there was a stormy de-

bate on the subject in the Chamber, his opponents contending that it would be absurd to contract a heavy loan for a navy of that description, when the army reorganization, which was urgently needed, was deferred for lack of funds. Parliament voted the budget April 18, including funds for naval reorganization and the remuneration of foreign officers, but the opposition to the choice of Admiral Fournier continued. A change took place in the Cabinet early in July, whereby M. Gounaris, former President of the Chamber, became Minister of Finance. Greece acquiesced in the action of the Powers in announcing after Crete's proclamation of union with Greece that they would make it a subject of negotiation with Turkey, and that, meanwhile, order on the island must be maintained. See **BALKAN QUESTION** and **CRETE**.

GREEK CATHOLIC CHURCH OR GREEK CHURCH. A religious body, which comprises in its widest sense all those churches following the Greek or Greco-Slavonic rite. Its official title is the Holy Orthodox Catholic and Apostolic Church. Throughout the world it has a membership of about 100,000,000. In the United States are four branches, as follows: Russian Orthodox, with a membership of about 55,000, with 103 churches and 75 ministers; the Greek Orthodox, 100,000 members, with 42 churches and 43 ministers; the Syrian Orthodox, 30,000 members, with 21 churches and 13 ministers, and the Armenian, 8,500 members, 21 churches, and 15 ministers. The Archbishop in charge of the Russian Orthodox Church formerly had his seat in Alaska, but now resides in New York City. The Greek Church has no Bishop in the United States. The Syrians belong to the Synod of Antioch. They have a Bishop consecrated by the Russian Archbishop.

GREER, DAVID HUMMELL. Seventh Bishop of the Protestant Episcopal Diocese of New York. He was born in Wheeling, W. Va., in 1844, graduated at Washington College, Pa., in 1862, and at the Protestant Episcopal Seminary at Gambier, O., in 1865. He was ordained deacon in 1866 and priest in 1868, and afterward was rector of parishes in Clarksburg, W. Va., Covington, Ky., and Providence, R. I. In 1888 he became rector of St. Bartholomew's Church in New York city. He was elected bishop coadjutor in 1903, and, upon the death of Bishop H. C. Potter (q. v.) on July 21, 1908, became Bishop of New York City.

GREENLAND. See **DENMARK, Danish Colonies**; **POLAR RESEARCH**.

GRENADA. A British island of the West Indies, forming with Carriacou an administrative division of the Windward Islands (q. v.). Total area, 133 square miles; total population (1906), 70,505. Over 30,000 acres are under cultivation. Coffee, cacao, nutmegs, fruit, rubber, and cotton are grown. The forests yield valuable woods, gums, and medicinal plants. The imports and exports in 1907 amounted to £288,665 and £417,299, respectively. The revenue in the fiscal year 1907-8 was £79,871; the expenditure, £68,383, and the public debt, £123,670.

GUADELOUPE. An island of the Lesser Antilles, the largest of the French West India Islands. Area, 619 square miles; population (1901), 157,806. With its dependencies, La Désirade, Les Saintes and Petit-Terre, Marie-

Galante, St. Barthélemy, and St. Martin, it constitutes a colony with an area of 732 square miles and a population (1906) of 190,273. The capital is Basse-Terre, with 8,626 inhabitants. The principal port is Pointe-à-Pitre, 14,861 inhabitants. The principal products are sugar, rum, coffee, and cacao, besides manioc, tobacco, bananas, sweet potatoes, maize, and vegetables. In 1906 there were grown 6,129 pounds of cotton. The imports and exports in 1907 amounted to 13,425,655 and 16,268,946 francs respectively, the trade with France being represented by 9,163,000 francs of imports and 15,875,000 francs of exports. The colony is administered by a Governor, an Executive Council, and an elective Legislative Council. It is represented in the French Parliament by a senator and two deputies. In 1907 the military force consisted of 94 Europeans. The local budget for 1907 balanced at 4,756,000 francs. The debt stood in 1907 at 10,575,000 francs. The expenditure of France in 1908 was fixed at 430,000 francs. The Governor in 1908 was M. Ballot.

GUAM. A possession of the United States lying in the Pacific Ocean, the largest of the Ladrone Islands. It is situated in lat. 13° 30' N. and long. 144° 45' E. It is the southernmost of the Ladrone group, and is about 1,500 miles east of Manila and nearly the same distance southeast of Yokohama. The island has an area of about 150 square miles, and is 29 miles long and from 3 to 10 miles wide. Its chief importance is as a naval station and port of transit between America and Asia. The natives consist chiefly of aboriginal Chamorros intermixed with Tagalogs and Malays. Their only occupations are agriculture and fishing. The population of the island in 1908 was about 9,000, of which more than half are in the capital, Agaña.

GOVERNMENT. Guam has not been organized as a territory by act of Congress or otherwise, and the constitution and laws of the United States have not been extended to it. Its administration is in the hands of the Navy Department and a naval officer is Governor. In 1907 an order was issued by President Roosevelt directing that all official communications and reports relating to Guam should be transmitted to the Secretary of the Interior. Consistent and successful efforts have been made since the acquisition of Guam by the United States to bring about better educational, social, and sanitary conditions among the inhabitants. In 1908 a thorough investigation was made of the agricultural, social, and sanitary conditions, but the reports that were prepared had not been published at the end of the year. Successful experiments were made in agriculture by the Agricultural Experiment Station (q. v.) established by the Department of Agriculture. The Governor is assisted in his administration by an advisory and legislative council, composed of certain officers, with a minority of natives. The courts are of three classes, a court of appeals, a court of first instance, and courts of justice. The island is divided into four districts for purposes of administration, each with an executive head called the Gobernadorcillo (Commissioner). These officials are natives and are elected by popular vote. Directly after the American occupation schools were established in the island, and great progress has been made in the instruction of the natives. Night schools are conducted in the largest towns. The Secretary

of the Navy in his report for 1908 renews recommendations made in previous year that Congress enact legislation establishing a form of government for Guam. Similar recommendations were made by President Roosevelt in his message to the Sixtieth Congress. The Governor of Guam in 1908 was Captain Edward J. Dorn, U. S. N.

GUARANTEE OF DEPOSITS. See **BANKS AND BANKING.**

GUATEMALA. The most northerly republic of Central America. Area, 48,300 square miles; population (1903), 1,842,134, of whom 750,615 were whites. On Dec. 31, 1906, the population was estimated at 1,882,992. The principal cities, with their populations, are: Guatemala, the capital, 125,000; Coban, 30,770; Quezaltenango, 28,940; Totonicapan, 28,310; San Pedro, 10,190.

EDUCATION. In 1907 there were 1,262 government primary schools, with 44,240 pupils. For secondary instruction there are schools at Guatemala City, Quezaltenango, and Chiquimula, under the direction of Belgian professors. The higher educational institutions at Guatemala City and Quezaltenango include schools of law, medicine, dentistry, pharmacy, and commerce. There are a national school of music and a school of fine arts. The pupils of the night schools for working people are exempt from military service. Many Guatemalan youths are educated abroad at government expense. There is a corps of men and women teachers from the United States.

PRODUCTION. The principal export crop is coffee, of which 90,199,486 pounds were exported in 1907. The output of 1907-8 was estimated at 50,000,000 pounds, and of 1908-9 at 81,000,000 pounds. Sugar covered in 1906 about 37,000 acres; the exports were 1,571,900 pounds in 1906, and 4,177,400 pounds in 1907. Tobacco covers some 1,700 acres. Some 200,000 acres have been acquired by foreign capitalists for rubber planting. In 1906 there were exported 376,300 pounds of rubber, and 516,719 bunches of bananas; in 1907, 392,160 pounds and 599,680 bunches, respectively. Wheat, maize, sweet potatoes, and beans are grown, but the cereal output is insufficient for the needs of the country. The cotton acreage is increasing. A decree of July, 1908, made the cultivation of a certain minimum of cotton obligatory on all municipalities. Some gold, silver, and salt is produced, but the mineral wealth has as yet been barely touched. The manufacturing industries include a cotton factory employing 250 workers, near Quezaltenango, breweries, sugar mills, and tanneries.

FOREIGN COMMERCE. In 1906 the total imports were valued at \$7,220,760, and the exports at \$7,136,280; in 1907 they were \$7,316,574 and \$10,174,486 respectively. In 1907 the imports included cotton goods, valued at \$1,470,975; railroad material, \$552,504; silk manufactures, \$184,000; woollens, over \$90,000; flour, \$291,810; rice, \$34,000; electrical apparatus, \$31,000. The exports of 1907 included coffee, \$7,297,346; hides, \$292,927; bananas, \$179,904; woods, mainly cedar and mahogany, \$236,464. Other exports were cacao, chicle, coconuts, deer skins, horns, vegetable oils, besides those mentioned under *Production*. The trade with the principal countries in 1907 was as follows: United States, imports from, \$2,905,457; exports

to, \$3,413,418; Great Britain, \$1,590,874 and \$1,071,468 respectively; Germany, \$1,574,854 and \$5,317,509.

COMMUNICATIONS. In 1907 the ports of Guatemala were entered by 549 vessels, of 975,526 tons. The chief ports are Puerto Barrios and Livingston, on the Atlantic, and San José, Champerico, and Ocos, on the Pacific. The Guatemala Northern railway connecting San José on the Pacific with Puerto Barrios on the Atlantic, *via* Guatemala City, a distance of 269 miles, was formally opened on Jan. 19, 1908. Quezaltenango is connected by rail with Champerico. Other lines were being constructed during 1908 by Germans and Americans. The total length of railways in 1908 was 440 miles. The length of telegraph lines in 1907 was 3,696 miles.

FINANCE, ETC. In 1907 the total revenues amounted to 35,297,823 paper pesos (of about 8 cents each), and the total expenditures, 44,560,221, including 22,700,026 pesos for the service of the public debt. The budget estimate of expenditure for 1908-9 was 35,488,692 paper pesos. On Dec. 31, 1907, the gold debt stood at 9,719,754 pesos and the paper debt at 63,307,003 pesos. The regular army numbers about 7,000 officers and men, the cost of which is about one-tenth of the public expenditure—about \$3,000,000 for 1908. The war strength, consisting of all citizens between 18 and 30 years of age, is 57,000, and the reserve, consisting of those between 30 and 50 years of age, 30,000 men. The President in 1908 was Manuel Estrada Cabrera, reelected in 1905, whose term expires in 1911.

HISTORY. The message of President Estrada Cabrera at the opening of the regular session of the National Assembly on Mar. 1, 1908, began with congratulations to the country on the satisfactory state of its international relations. At the opening of the Inter-oceanic (or Guatemala Northern) Railway all the members of the diplomatic corps were present. The government participated in the second international peace conference held at The Hague in 1907, in the international sanitary conference which met in Mexico in Dec., 1907, and in numerous other international gatherings. During the conflict in 1907 between Honduras and Nicaragua, the Guatemalan government had maintained its neutrality undisturbed. The President expressed entire approval of all the decisions of the Central American Peace Conference held at Washington in the latter part of 1907, and gave expression to the hope that peace in Central America would never again be disturbed. Turning to internal questions the President stated that a committee had been appointed to draft amendments to the school law, in order to extend to the towns the system of practical instruction adopted in the capital. Buildings for practical schools for men have been erected in various parts of the Republic. The General Bureau of Mines, Industries, and Commerce, established in 1907, made a collection of metallic minerals and of materials suitable for purposes of construction, sculpture, ceramics, etc. This collection, exhibited at the National Exposition held at the capital in the early part of 1908, manifested the great mineral wealth of Guatemala. The fisheries established in Lake Amatitlan, in pursuance of the law of Aug., 1907, have given satisfactory results and may lead to the establishment of a new industry in the country. Public

works, the telegraph and telephone service, and the railroads made notable progress during the year. On April 20, 1908, an attempt was made to assassinate President Cabrera on his way to the National Palace to receive the new American minister. The following day martial law was proclaimed in Guatemala City, and three days later the President announced that eighteen men implicated in a plot to assassinate him had been executed. During the year there were difficulties with Honduras, whose special commissioner to Guatemala was arrested and then (May 21) released; with Mexico, which country was reported in May to be massing troops on the frontier; and with Nicaragua, which, in June, made strong representations to Guatemala to obtain the release of Nicaraguan citizens who were held prisoners in Guatemala. On Nov. 2, 1908, the Guatemalan Secretary of State was received by President Roosevelt as Envoy Extraordinary and Minister Plenipotentiary. The object of the mission was to express to the United States government the thanks of the Guatemalan government and people for its part in establishing peaceful conditions in Central America and for its long-standing friendship towards Guatemala.

GUNPOWDER. See **MILITARY PROGRESS**.

GYMNASTICS. The tenth annual intercollegiate gymnastic meet was won by Princeton. The result was a surprise, as New York University, champion for 1906 and 1907, had made much the better showing in the preceding dual meets. In the intercollegiate contest Princeton scored 20 points; New York University and Columbia were tied for second place with 10 points each; Yale and Rutgers were tied at 6 points each; and Harvard and Pennsylvania each scored one point. The individual championship was won by E. W. McCabe of Princeton, with a total of 309.8 points; H. S. Schoonmaker of Columbia was second, with 296 points, and H. L. Dowd of Princeton was third, with 293.2 points. In the dual meets New York University defeated Princeton 33 to 15, Yale 33½ to 20½, and Columbia 32½ to 22½. Columbia defeated Yale in a dual meet by the score of 33 to 21. The all-round national championship of the American Athletic Union was won by Fred Steffens of the Brooklyn National Athletic Club, who scored a total of 50 points. The banner given to the team, scoring the largest number of points, was won by the West Side Y. M. C. A., which had a total of 20 points in the eight events. At the international tournament, which took place at Frankfort-on the Main in July, Mapler of Munich won the all-round championship, scoring 130 points.

GYPSY MOTH. See **ENTOMOLOGY**.

HADLEY, HERBERT SPENCER. Governor-elect of Missouri. He was born at Olathe, Kan., in 1872, graduated at the University of Kansas in 1902 and at the Northwestern University Law School; and in 1894 began the practice of law at Kansas City, Mo. From 1898 to 1901 he was prosecuting attorney of Jackson County and in 1904 was elected Attorney-General on the Republican ticket. As Attorney-General he aided greatly in carrying

out Governor Folk's reform programme, rendering especially valuable service in collecting evidence against the Standard Oil Company and its subsidiary companies, and against the Harvester Trust for violations of the State anti-trust laws. In 1908 Mr. Hadley received the Republican nomination for Governor and in the ensuing elections was given a plurality of over 15,000, running far ahead both of his associates on the State ticket and of his party's national ticket. See **MISSOURI**.

HAFID, MULAL. Sultan of Morocco, proclaimed on February 11, 1908. He was born in 1873, a half brother of Abd-el-Aziz, whom he drove from the throne, and was educated at the University of El Azaar, in Cairo. For several years he was viceroy of Southern Morocco, but in August, 1907, he proclaimed himself Sultan, and took the field against Abd-el-Aziz. He was successful, and after being proclaimed Sultan was eventually recognized by the Powers. See **MOROCCO**.

HAGUE CONFERENCE. See **INTERNATIONAL ARBITRATION**.

HAITI. A republic occupying the smaller western half of the island of Haiti, West Indies. Including the adjacent islands of Tortuga, Gonaive, and Vache, its area is estimated at between 10,200 and 11,000 square miles. According to an ecclesiastical estimate, the population numbered about 1,500,000 in 1906, nearly all negroes and mulattoes, with some 200 Europeans. The prevailing language is French. The principal cities, with their estimated populations, are: Port au Prince, the capital, 70,000; Cape Haitien, 29,000; Aux Cayes, 25,000; Gonaives, 18,000; Port de Paix, 10,000. There are some 400 national elementary schools, besides private ones, and 5 national lyceums.

PRODUCTION AND COMMERCE. The most important agricultural product is coffee, covering 125,000 acres, of which some 50,600,000 pounds were exported in 1906. Other important products, with the amount of their exports in 1906, are as follows, in pounds: Cacao, 4,582,000; cotton, 3,865,000; cotton seed, 6,208,000; pité hemp, 399,000; sisal hemp, 670,000; hides and skins, 660,000; orange peel, 494,000; honey, 6,700; wax, 149,000; peanuts, 30,000; woods, including cedar, fustic, logwood, mahogany, and white wood, 122,598,000. The cultivation of tobacco is extending, and there is a cigar and cigarette factory. Sugar is grown, there being four sugar mills, but no refineries. Rum and other spirits are distilled. There is a tannery employing some 200 native workmen. Cuban and Italian shoemakers supply the local demand for shoes. The mineral wealth, which is neglected, includes gold, silver, copper, iron, manganese, tin, antimony, nickel, sulphur, coal, kaolin, gypsum, limestone, and porphyry. The imports and exports for the fiscal year 1904-5, the latest for which the data had been published, in 1908, amounted to \$3,871,059 and \$8,967,862 respectively. According to United States returns for the fiscal year ending June 30, 1908, the imports from Haiti amounted to \$689,045, and exports to Haiti, \$3,649,172. The United States furnishes about 70 per cent. of the total imports, Great Britain 13, France 10, and Germany 2 per cent. In 1907 Port au Prince was entered by 186 vessels of 182,000 tons; Aux Cayes was entered and cleared in 1906 by 264 vessels of 312,294 tons. In 1905 the

merchant marine consisted of 5 steamers, aggregating 908 tons net, and 13 sailing vessels of 50 tons and over, aggregating 2,280 tons. There is a 15-mile railway from Cape Haiti to Grande Rivière, and a light railway of 28 miles from Port au Prince to Lake Assuéfi.

FINANCE, ETC. In 1906 the export duties amounted to \$2,730,761 gold, and the import duties to 5,135,250 paper gourdes (worth about 20 cents each). For 1906-7 the revenue was estimated at \$3,973,899 gold, and 6,186,122 paper; the expenditure, at \$3,999,428 gold, and 6,167,059 paper gourdes. The greater part of the expenditure is for the service of the debt, which at the end of 1906 amounted to \$26,134,438 gold, and 12,429,739 paper gourdes. The National Bank of Haiti, with a capital of 10,000,000 francs, has its headquarters in Paris and six offices in Haiti. It negotiates loans for the government, issues bank notes, etc. The authorized strength of the regular army is about 7,000 men of all ranks, but the actual peace strength is 650 officers and men of the line, which constitutes the Government Guard. There are from 10 to 20 generals who act as aides to the President of the Republic. The navy consisted at the beginning of 1908 of 2 gunboats, of 1,472 tons, and 3 steamers, of 2,310 tons. In 1908 Nord Alexis was President until his overthrow on Dec. 2. (See *History*.) On Dec. 20, General Antoine Simon was inaugurated President.

HISTORY. Disturbed political conditions continued during 1908. A band of exiles, led by a former lieutenant of Gen. Firmin's, landed near Gonaives, Jan. 15, and attempted a revolution, but President Nord Alexis took vigorous measures against them and the movement was suppressed. On Mar. 15 he had a number of political suspects arrested and immediately executed. American, British, French, and German warships thereupon gathered at Port au Prince. Gen. Firmin and other fugitives found refuge at the French Consulate at Gonaives. The Haitian government at first demanded their surrender but afterward agreed to their leaving the country, and on Mar. 21 they went on board a French warship and were taken to St. Thomas. The failure of the revolutionary movement was attributed in considerable measure to the action of the United States government in preventing the despatch of arms and ammunition intended for General Firmin. The latter's agent Giordani was arrested in New York on the eve of the outbreak and a ship's cargo of war equipment together with a large sum in counterfeit Haitian currency was seized. General discontent with the stern rule of Nord Alexis was intensified by his ruthless measures of repression. On Nov. 19 an insurrection broke out at Aux Cayes. It was headed by General Antoine Simon, commander of the troops in the Southern department of Hayti, who was suspected of disloyalty by Nord Alexis and deposed. General Simon thereupon declared against the President and set out for Port au Prince at the head of his soldiers, who constituted the strongest and best drilled and military force in the country. He met little opposition on his march, the government's troops everywhere joining hands with the revolutionists. On Nov. 27, Simon defeated General Cyriouque. The aged Nord Alexis, though deserted by practically his entire cabinet, the members of which either went over to the enemy, or fled, was determined

to continue the struggle. On Dec. 2, the people of Port au Prince, alarmed by the presence of General Simon's army in the neighborhood of the city, rose in insurrection. A Committee of Public Safety, headed by ex-President Légitime, was organized and the crowds prepared to storm the presidential palace. The presence of the American and French men-of-war in the harbor probably prevented serious bloodshed. The President's life was saved by the intervention of the French minister, under whose protection Nord Alexis left the palace. He took refuge on a French cruiser, which conveyed him to Kingston, Jamaica. He had maintained himself in power for nearly seven years, through mingled skill and ferocity. On Dec. 5, General Simon entered Port au Prince with his army of 5,000 men. Several old aspirants to the presidency such as General Firmin, General Sain, and General Fouchard now came forward and for a time the renewal of civil war seemed probable. General Simon was not popular in the north, where disturbances took place at Port de Paix, Hinche, and Jean Babel. But Simon's military strength was sufficient to overawe all his rivals, and on Dec. 17 he was elected President by the unanimous vote of Congress. He assumed office on the 20th. As a measure of prudence, he appointed some of the unsuccessful presidential candidates to positions in his cabinet.

HALDERMAN, JOHN A. An American soldier and diplomat, died on Sept. 21, 1908. He was born in Kentucky, on April 15, 1833, and studied law in that State. In 1854 he went to Kansas, where he subsequently held several political positions, serving as private secretary to the governor, judge of the probate court, mayor of Leavenworth, State legislator, and regent of the University of Kansas. At the outbreak of the Civil War he entered the Federal Army, in which he served as major in the Kansas First Volunteer Infantry, and afterward as major-general. In 1861, he was appointed provost marshal-general of the Army of the West and became a member of the staff of General Nathaniel Lyon. At the battle of Wilson's Creek, his bravery won for him honorable mention and led to his appointment to the command of his regiment. In 1862 he organized the Northern Division of the Kansas State troops against the expected invasion of the Confederate Army. In 1880 he was appointed consul at Bangkok, Siam; later became Consul-general, and, finally, in 1882, was made the first minister to Siam. In 1885 he resigned and returned to the United States.

HALÉVY, LUDOVIC. A French dramatist and novelist, died on May 7, 1908. He was born at Paris, on Jan. 1, 1834, and was educated at the Lycée Louis le Grande. In 1852, he entered the government service as an attaché to the Minister of State; in 1858 was made head of the Colonial Bureau, and in 1860 became clerk to the Secretary of the Legislative Corps. He resigned this position in 1865 to devote his entire time to writing. While in the employ of the government he wrote several librettos, for most of which Offenbach composed the music. The most important of these early works were the operettes *Ba-ta-clan* (1855), *Le docteur Miracle* (1857), which he wrote in collaboration with Léon Battu, and for which Lecocq and Bizet wrote the music; and the *Orphée aux enfers* (1861). The greater part of the remainder of

his writings for the theatre were prepared in collaboration with Henri Meilhac. Among these are Offenbach's librettos, including *La belle Hélène* (1865); *Barbe-bleue* (1866); *La vie parisienne* (1866); *La grande duchesse de Gérolstein* (1867), and *La Périhole* (1868); and Bizet's *Carmen* (1875). The two writers also collaborated in the production of several more pretentious works, such as: *Froufrou* (1869), a comedy in five acts, their most successful work of the kind; *La Réveillon* (1872); *La Petite marquise* (1874); *La Boule* (1874); *La cigale* (1877); *Le mari de la débutante* (1879); *Le roi Candaule*; and *La roussotte*, which was the last work in the preparation of which Meilhac collaborated. In addition to writing for the stage, Halévy produced a few novels and romances, and after the breaking off of his association with Meilhac he devoted nearly all his time to this class of writing. His principal productions of this class are *L'invasion* (1872); *Madame et Monsieur Cardinal* (1873); *Les petites Cardinal* (1880); *Un mariage d'amour*, (1881); *L'abbé Constantin* (1882); which is the best-known and most widely read romance, and which also has been successfully dramatized; *La famille Cardinal* (1883); *Criquette* (1883); *La Princesse* (1886); *Karikan* (1888). Halévy was elected to the French Academy in 1884.

HALL, CHARLES CUTHBERT. An American theologian, died on Mar. 25, 1908. He was born in New York City, on Sept. 3, 1852, and studied with tutors until his sixteenth year, when he entered Williams College, where he graduated in 1872. He then studied for two years at Union Theological Seminary, and for another year (1874-75) at the Presbyterian College, in London, and at the Free Church College in Edinburgh. He had been licensed in 1874 to preach, and in 1875-77 he was pastor of the Union Presbyterian Church of Newburgh, N. Y. He was then pastor of the First Presbyterian Church of Brooklyn, N. Y., from 1887 to 1897, when he became president of the Union Theological Seminary, a position he held until his death. In 1902-03 and in 1906-07, he was Barrows lecturer to the Far East for the University of Chicago, and he was also Cole lecturer at Vanderbilt University in 1905, and Noble lecturer at Harvard in 1906. He received the degree of D.D. from the University of New York (1890), from Harvard (1897), and from Yale (1901), and an LL.D. from Union College in 1905. Dr. Hall's presidency of Union Theological Seminary began at the time of the controversy over the higher criticism of the Bible, as exemplified particularly in the writings of Dr. Briggs. Toward this question he adopted a very liberal and tolerant attitude, declaring that the fact that Professor Briggs had entered the Episcopal Church should not affect his connection with the faculty of the Seminary. He resolutely maintained this position in the face of attempts to boycott that institution. His mission to the Far East was successful because of his earnest striving to find a common ground, and his ability to separate what was permanent and essential in Christianity from what was merely temporary and accidental or racial. He was a zealous student of hymnology and liturgy, anxious to introduce into the service of the non-Episcopal churches such forms as would give dignity and completeness to worship, and to restore it to the

place from which it has often been dislodged by over emphasis on the sermon.

HALSTEAD, MURAT. An American journalist, died on June 2, 1908. He was born at Paddy's Run, Butler County, Ohio, on Sept. 2, 1829, graduated at Farmers' College, near Cincinnati, in 1851, and then began general newspaper work in Cincinnati. He started in that city a Sunday paper, the *Leader*, which expired with its third issue; then became news editor of the *Atlas*, and then, after serving for a few days on the staff of the Cincinnati *Enquirer*, assistant editor of the *Columbian*, a literary weekly. In 1853 he became a reporter for the Cincinnati *Commercial*, in which he obtained an interest in 1854, and which in 1883 was consolidated with the Cincinnati *Gazette*. Of this paper, Halstead became editor-in-chief, and he made it one of the most influential daily newspapers in the Middle West. He opposed Blaine in 1876, but afterward was one of his staunchest supporters. He was nominated minister to Germany in 1889 by President Harrison, but the Senate, by a close vote, refused to confirm the nomination, apparently because of the articles Halstead had written insisting that the purchase of seats in the Senate was no uncommon occurrence. He published several works on historical subjects.

HAMY, THÉODORE JULES ERNEST. A French anthropologist, died on Nov. 18, 1908. He was born in Boulogne-sur-Mer, on June 22, 1842; studied medicine at Paris, receiving his diploma in 1868; became an assistant naturalist in the department of anthropology of the Museum of Natural History in 1872, and professor of that subject in 1892. He became a member of the Academy of Inscriptions in 1890, and was made an officer of the Legion of Honor in 1889. He published *Précis de paléontologie humaine* (1870); with De Quatrefages, professor of anthropology in the Museum of Natural History, the valuable *Crania ethnica* (1875-82); *Anthropologie du Mexique* (1884); *Decades Americanae* (1883). He was appointed in 1890 director of the Museum of Ethnography, which had just been established in the Trocadéro. Here for the next 20 years he did much effective work, though always hampered by the lack of funds. In connection with his work he published: *Origines de Musée d'Ethnographie* (1890) and the *Galerie américaine du Musée d'Ethnographie du Trocadéro* (1897); and *Études historiques et géographiques* (1896).

HANFORD, BEN. Socialist candidate for vice-president. See **PRESIDENTIAL CAMPAIGN.**

HANLON, EDWARD. A Canadian oarsman, died at Toronto on Jan. 4, 1908. He was born there, on July 12, 1855, and began his career as a sculler in 1873, and in 1876 won the singles at the Centennial Exposition. From 1876 to 1884 he defeated such oarsmen as Wallace Ross (twice); Morris, in 1878, for the American championship; Plaisted Courtney, Hawdon (on the Tyne), Elliott, champion of England (on the Tyne); Trickett, for the world's championship (twice on the Thames, 1880 and 1882); Teemer, Lee, and Gaudaur. In 1885, Teemer won the American championship from him at Troy and he defeated him again in 1887; and Beach, the English oarsman, beat him four times in Australia. Hanlon rowed his last race in 1897, when he was defeated at Orilla, Ontario, by Gaudaur. Hanlon's sculling stroke was remarkable for its apparent ease, perfect

finish and sustained power, the result being that his shell seemed to lose none of its speed between strokes.

HARBORS. See **DOCKS AND RIVER AND HARBOR IMPROVEMENT.**

HARDEN, MAXIMILIEN. German journalist See **GERMANY**; paragraph, *Harden Trial.*

HARMON, JUDSON. An American lawyer and statesman, was elected governor of Ohio at the general election of 1908. He was born in Newton, O., on Feb. 3, 1846, and graduated at Denison University in 1866. He settled in Cincinnati, was judge of the Court of Common Pleas in 1876-78, and of the Superior Court from 1878 to 1887, when he resigned to resume the practice of law. He was appointed Attorney General of the United States in 1895 and served throughout the remainder of Cleveland's term. He was nominated for governor by the Democratic State convention at Columbus on May 6, 1908, and was elected in the following November, receiving about 50,000 votes more than the national ticket of his party. At the time of his election he was acting as receiver of the Cincinnati, Hamilton & Dayton Railroad Company.

HARRIMAN INVESTIGATION. See **RAILWAYS.**

HARRINGTON, CHARLES. An American educator, physician, and sanitarian, died on Sept. 11, 1908, in Lynton, Devonshire, England. He was born in Salem, Mass., on July 29, 1856, was educated at Bowdoin College (1873-74) at Harvard, where he graduated in 1878, and at the Harvard Medical School (1881); and he also studied for two years at Leipzig, Strasburg, and Munich. He was appointed assistant in chemistry at Harvard in 1883, was assistant professor of that subject there in 1893-1906, and professor of hygiene during the remainder of his life. He became associated with the Massachusetts State Board of Health in 1900, for nine years was chemist for the Board, in 1889-1904 was in charge of the bureau of milk inspection of the Boston Board of Health, and in 1904 became secretary of the State Board. For several years he was on the staff of the *Boston Medical and Surgical Journal*. His text book, *Practical Hygiene* (1901), passed through many editions.

HARRIS, JOEL CHANDLER. An American author and journalist, famous throughout the English-speaking world as the creator of "Uncle Remus," died at his home in Atlanta, Ga., on July 3, 1908. He was born in Eatontown, Ga., on Dec. 8, 1848, and had a little schooling in the academy in that town, which he supplemented by eager and, even as a boy, appreciative reading of good literature. At this time, it is said, he enjoyed the Elizabethan writers, and relished the literary flavor of the *Vicar of Wakefield*. When he was twelve years old, he became a printer's apprentice in the office of *The Countryman*, a weekly paper published at Eatontown by Col. J. A. Turner. Harris soon began to write, and presently he had become a regular contributor to the paper of local news articles, essays, and verse. This matter, which was published sometimes anonymously and sometimes signed, revealed not only a natural and rapidly developing literary facility, but unusual deftness in the art of telling a story. Civil War conditions were not calculated to encourage literary effort in Georgia, and as Sherman's army approached Eatontown, Colonel Turner withdrew to a less

strenuous atmosphere, leaving young Harris in charge of his plantation, with the result that he saw and absorbed the significance of that relentless invasion, whereof he afterward recorded his impressions in his books *On the Wings of Occasions*, and *Tales of the Home Folks in Peace and War*.

After the war, Mr. Harris was employed successively on newspapers in Macon, New Orleans, Forsyth, and Savannah, as an editorial writer for the *Morning News* in the last named city. Driven from Savannah, (where he had been rapidly making a name for himself) by the epidemic of yellow fever in 1876, he removed to Atlanta, and joined the staff of the *Constitution*. For this newspaper, Sam W. Small, afterward an evangelist, had been writing a series of "Old Si" negro sketches, the publication of which was suddenly interrupted by the illness of Mr. Small. Capt. E. P. Howitt, the editor, suggested to Mr. Harris that he continue the feature. With many misgivings he consented to try, and the result of the trial was the appearance in the literary world of the delightful and inimitable "Uncle Remus."

For twenty-five years after the appearance of "Uncle Remus" in the literary world, Mr. Harris continued his daily "desk work" in the office of the *Constitution*, and produced his full share of the editorial matter for that paper, and it was not until within a few years before his death that he began gradually to withdraw from active daily journalism. In 1907 he established the *Uncle Remus Magazine*, subsequently consolidated with the *Home Magazine*. His principal volumes, in the order of their appearance, are as follows: *Uncle Remus; His Songs and His Sayings* (1880); *Nights with Uncle Remus* (1881); *Life of Henry W. Grady, Including His Writings and Speeches* (1890); *On the Plantation, a Story of a Georgia Boy's Adventures During the War* (1892); *Uncle Remus and His Friends* (1892); *Stories of Aaron* (1895); *Stories of Georgia* (1896); *Georgia, from the Invasion of De Soto to the Present Time* (1896); *Tales of the Home Folks in Peace and War* (1898); *On the Wing of Occasion; Being the Authorized Version of Certain Curious Episodes of the Late Civil War* (1900); *Gabriel Tolliver; a Story of Reconstruction* (1902); *The Tar Baby and Other Rhymes of Uncle Remus* (1904); *A Little Union Scout* (1904); *Told by Uncle Remus* (1905); and *Uncle Remus and Br'er Rabbit* (1907); and *The Bishop and the Boogerman* (1908).

HARVARD UNIVERSITY. An institute of higher learning at Cambridge, Mass., founded 1636. The attendance in 1907-08 was 5,075; in the fall of 1908, 4,915. In the Graduate School of Arts and Science, the Graduate School of Applied Science, the Divinity School and in the Summer School, there was an increase of attendance. Harvard College, the Scientific School, the Law School, the Medical School, and the Dental School showed a decrease. The Graduate School of Business Administration was established in the fall of 1908, opening with a membership of 58. The course of study covers two years, and offers work in accounting, commercial law, economic resources, industrial organization, banking and finance, transportation, insurance, and public business. The degree offered is Master in Business Administration. The Dean of the School is Professor Edwin F. Gay.

The Andover Theological Seminary became allied with the Harvard Divinity School, but retains its independence and separate corporate entity. The headquarters are at Cambridge. In accordance with the rules made for conferring the degree of A.B. with distinction, in June, 1908, 35 were conferred *cum laude* on a subject or related subjects; 25 *magna cum laude* on a subject or related subjects; 3 *summa cum laude* on a subject or related subjects. Among the gifts to the University may be mentioned the following: one amounting to \$300,000, to be used partly for traveling scholarships, partly for the library; a fund of \$25,000 for the building and endowment of the Dental School; \$175,000 to endow the Department of Biological Chemistry; \$50,000 to the Germanic Museum toward the erection of a building; property amounting to \$65,000 to the Weld Boat House. Among the scholarships and fellowships, \$12,000 to establish in the Medical School a Teaching Fellowship in the Hygiene of Mental Diseases; \$100,000 to establish two scholarships of \$250 each to be called the George Newhall Clark Scholarships. Professor Wm. M. Davis, of the Department of Geology and Geography, was chosen by the German government as Visiting Professor at the University of Berlin; Professor Kühnemann, lecturing on German literature, was Exchange Professor at Harvard. The Hyde Lectures during the year 1908-09 are given by M. Abel Le Franc. Professor A. C. Coolidge, of the Department of History, was representative at the Historical Congress at Saragossa, and at the Congress of Arts and Science at Santiago di Chile. The Shaler Memorial Expedition to South America, in memory of the late Professor N. S. Shaler, of the Department of Geology, was under the direction of Professor J. B. Woodworth, of the same department. The resignation of President Chas. W. Eliot (q. v.), to take effect May 19, 1909, was the chief event of the year. The endowment of the University in 1908 was \$20,272,346.90. The receipts in the year 1907-8, \$2,838,400.49.

HASKELL, CHARLES NATHANIEL. An American politician and governor of Oklahoma. He was chairman of the Committee on Resolutions and took a prominent part in the Democratic National Convention at Denver, in July, 1908. He later became treasurer of the National Committee, but resigned early in the campaign, after having been charged by William R. Hearst with attempting to bribe Attorney-General Monett, of Ohio, in 1899, in behalf of the Standard Oil Company. He became involved in a controversy with President Roosevelt, which was a feature of the presidential campaign of 1908. See **PRESIDENTIAL CAMPAIGN**. No convincing proof of the charge was ever given. He was born in Putnam county, Ohio, in 1860, and in 1881 was admitted to the bar. He was active in Democratic politics in Ohio for many years and also in railway construction work. He removed to Indian Territory in 1901, settling at Muskogee. He was the leading spirit in the adoption of the Oklahoma State Constitution in 1907, and was elected first Governor of the State in that year. See **PRESIDENTIAL CAMPAIGN**; **STANDARD OIL**.

HAWAII OR HAWAIIAN ISLANDS (formerly SANDWICH ISLANDS), A territory of the United States comprising a chain of islands in the Pacific Ocean, forming the extreme northern group of Polynesia. The capital is

Honolulu, on the Island of Oahu, 2,100 miles from San Francisco, 4,803 miles from Manila, and 3,850 miles from Salina Cruz, the Mexican Pacific terminus of the Tehuantepec Railway.

AREA AND POPULATION. The total area of the Hawaiian Islands is 8,449 square miles, and the area of the inhabited islands is as follows: Hawaii, 4015 square miles; Maui, 728 square miles; Kahulawe, 69; Molokai, 261; Lanai, 133; Oahu, 600; Kauai, 544; and Niihau, 97. The last official census of the islands was taken in 1900, when the total population was 154,000. Conditions since that time make it difficult to estimate the present population. It is probably 170,000, divided about as follows: Orientals, 95,000, including 72,000 Japanese, 18,000 Chinese, and 5,000 Koreans; Latins, 27,000, including 23,000 Portuguese, 2,000 Spanish and 2,000 Porto Ricans; Polynesians, practically all Hawaiians and part Hawaiians, 35,000; Teutons, practically all of the American, British, German and Norwegian descent, 12,000; others, 1,000.

AGRICULTURE. The chief industries of Hawaii are connected with agriculture, although the nature of the crops is such as to require much incidental manufacturing. The growing of sugar has received the greatest attention, and nowhere has science been applied more extensively to this industry. A beginning has been made in the scientific development of other agricultural products. See **AGRICULTURAL EXPERIMENT STATIONS: FORESTRY.**

The sugar industry is conducted mainly by forty-nine corporations and five private companies or individuals. Many independent planters on a small scale raise cane and sell it to the corporations. The total capital invested in the sugar industry, exclusive of bond issues, was, in 1908, \$70,913,797. The total yield in 1908 was 529,123 long tons, as against 440,017 long tons in 1907. The value of the crop of 1908 was more than \$40,000,000. The total area devoted to the culture of sugar is about 213,000 acres, of which about one-half is irrigated. About 45,000 laborers are employed on the sugar plantations, of which Japanese numbered over 30,000, and the total Asiatics, 36,987.

Among other minor agricultural industries is the production of rice, which is carried on largely by the Chinese upon land leased at rentals of from \$10 to \$50 per annum per acre. About 11,000 acres are under cultivation. The annual product is valued at about \$2,500,000. Almost

the entire crop is consumed in the Territory. The rice industry has suffered much in late years in competition with rice grown in Texas and other parts of the United States, and importations of Japanese rice, which is preferred by the Japanese to the rice grown in the Territory.

The coffee industry, which at one time promised to be of considerable importance, has fallen largely into the hands of the Japanese on account of low prices and the absence of protective duties. The output is mainly exported and exports for 1908 were valued at \$174,216,000. About 4,500 acres are devoted to coffee growing.

The pineapple industry is assuming large proportions and large quantities are exported to the United States. The estimate for the year ending May 31, 1909, is an exportation of 350,000 to 400,000 cases. Bananas are also exported, and the cultivation of coconuts has been begun on an extensive scale. The total exports of fruits and nuts for 1908 were valued at \$803,376. Among the newer industries are rubber, sisal, and honey.

The supply of cattle on the Islands is abundant. There were in 1908 about 130,477 head of cattle, valued, at \$1,678,277, and about 99,535 sheep, valued at \$126,757. Most of the meat is consumed in the Islands. See **AGRICULTURAL EXPERIMENT STATIONS: HORTICULTURE; FORESTRY.**

MANUFACTURING. The principal manufactures of the Islands are the numerous large mills for the production of raw sugar on the plantations, each mill usually representing an investment of from \$300,000 to \$1,000,000. The pineapple industry has an investment of about \$280,000 in nine canneries. There are a number of small coffee mills and rice mills. There are also fertilizer works, wineries, a wire bed factory, soap factory, brewery, and a tannery. The Japanese have recently established several manufacturing factories. The principal manufactory outside of the sugar mills is that of the Honolulu Iron Works at Honolulu. This is one of the largest manufacturers of sugar machinery in the world.

COMMERCE. The year 1908 was the most notable in the commercial history of Hawaii. The aggregate imports and exports for the year ending June 30, 1908, amounted to \$62,224,179. Of these the exports were \$42,238,455, and the imports, \$19,985,724. The table given below shows the imports and exports by countries for the fiscal years 1907-8.

Imports and exports, by countries, fiscal years 1907 and 1908.

Countries	Imports		Exports	
	1907	1908	1907	1908
Australia.....	\$ 304,154	\$ 348,806	\$ 9,918	\$ 3 331
Other British Oceania.....	71,707	64,569	2,087	1,814
British India.....	658,244	689,457		
Canada.....	47,392	26,093	14,444	15,625
Chile.....	325,637	491,352		
France.....	14,210	31,479		260
Germany.....	348,667	310,134	340	10,025
Hongkong.....	296,975	324,107	3,274	8,881
Japan.....	1,557,441	1,874,670	148,674	541,554
United Kingdom.....	483,341	481,269	44,230	2,073
Other.....	43,941	30,463	6,947	14,077
Total foreign.....	4,151,709	4,682,399	229,914	597,640
United States.....	14,225,210	15,303,325	29,134,467	41,640,815
Grand total.....	\$18,376,919	\$19,985,724	\$29,364,381	\$42,238,455

The aggregate tonnage of vessels entered and cleared during the fiscal year 1908 was the largest in the history of the Islands. In that year 416 vessels, with a tonnage of 1,075,939, entered; and 412 vessels, with a tonnage of 1,069,325, cleared. Of these vessels 303 were American, 64 British, and 33 Japanese.

The principal exports to the United States in 1908 were as follows: Sugar, raw, 1,054,395,987 pounds; refined, 23,174,675 pounds; coffee, 1,310,432 pounds; rice, 3,038,723 pounds; hides, 928,599 pounds; wool, raw, 359,413 pounds; or a total of 1,083,207,829 pounds.

TRANSPORTATION. Improvement in transportation facilities is one of the greatest needs of the Islands. This includes the development of at least one good harbor in each of the principal islands and two on the largest island; the construction of belt lines of railway; the reduction of freight and passenger rates, and increase in the available accommodations for passengers and perishable goods.

The most extensive railroad on the Islands is on the Island of Oahu, operated by the Oahu Railway and Land Company. This is about ninety miles long. Other smaller railways are operated on the other islands. There is one street railroad, that of the Honolulu Rapid Transit and Land Company, in Honolulu, which has twenty-four miles of line and forty-five cars. It carries about 7,000,000 pay passengers annually.

FINANCE. Expenditures for the fiscal year 1908 exceeded the receipts by \$147,630, the former being \$2,517,378, and the latter, \$2,669,748, but since the actual net cash surplus at the beginning of the year was \$313,476, there still remained at the close of the year a net cash surplus of \$165,845. The principal sources of revenue were as follows: Licenses, \$206,374; real property tax, \$640,051; personal property tax, \$635,265; income tax, \$266,241; water works, \$141,898; land revenue, \$122,541. The bonded debt of the Islands at the close of the fiscal year 1908 was \$3,379,000. During the year the debt was increased by the issue of \$294,000 3½ per cent. bonds.

EDUCATION. Public schools of the Islands are under the Department of Public Instruction, consisting of a superintendent and six commissioners. Private schools are required to obtain permits of the Department and are subject in a measure to its supervision. The enrollment in the public schools in 1908 was 18,564, an increase of 1,426 for the year; in private schools, 4,881, a decrease of 439. The teachers in the public schools numbered 476, and in the private schools 218. There were 154 public schools and 54 private schools. The attendance at the public schools was about 90 per cent. of the enrollment. The largest increase was in Japanese pupils, the pupils of that nationality increasing from 1,352 in 1907 to 5,513 in 1908. The cost of the public schools in 1908 was \$467,198. There was established during the year a college of agriculture and mechanical arts at Honolulu. The first regular freshman class entered in September, 1908.

IMMIGRATION. The arrivals and departures of Japanese in the Islands varies greatly. In 1904-5 the departures were nearly double the arrivals, due to the Russo-Japanese war. Since that date, the arrivals have, on the whole, considerably exceeded the departures, although the

tendency in 1908 was the other way, owing to restrictions placed by the Japanese government on emigration to Hawaii. This tendency is offset to some extent by the restrictions against the emigration of Japanese from the Hawaiian Islands to the Pacific Coast. The continued decrease in the Chinese population due to departures and non-arrivals is offset in large measure by births, the school children having increased from 1,289 in 1900 to 2,596 in 1908. The Portuguese are increasing rapidly. The pupils of that nationality numbered in 1908 4,537. Hawaiians are slowly decreasing and part Hawaiians increasing. The total number of Japanese men, women and children on the Island of Oahu is about 20,000, of which perhaps 10,000 or 12,000 are adult males, although these are very rough estimates.

POLITICS AND GOVERNMENT. The present Governor and Secretary of the Territory took office on August 15, 1907. Changes followed in the heads of several departments. Near the close of the fiscal year the Secretary of the Interior made a two weeks' visit, during which he toured the four principal islands. Besides its many direct benefits, this visit inspired the Hawaiians with the new confidence that Hawaiian affairs would be looked after by the Department with interest and intelligence. The visits during and soon after the close of the fiscal year of the Pacific fleet, the Atlantic fleet, the special service squadron, and several cruisers, produced an excellent impression and did much to cultivate the national spirit. In general, the year 1908 was one of unusual harmony and prosperity in the Islands.

Much attention was given during the year to questions of population, labor, and immigration. Japanese labor has been much reduced through the action of the Japanese government. The Board of Immigration assisted in returning many Europeans who had gone from Hawaii to California and took steps to obtain immigrants from the mainland, with New York as the center of operation. Labor has not been as scarce as was anticipated from the decrease of Japanese immigration. Planters and others exhibit a constantly increasing disposition not only to cooperate with the government in the introduction of persons of the Latin and Anglo-Saxon races and the settlement of public lands by such persons, but also to devote their own lands for the same purpose.

A radical change has been inaugurated in the treatment of leprosy. Hitherto, emphasis has been laid upon segregation, especially of well developed cases. Hereafter it is proposed to lay upon it scientific study and treatment, especially of cases in their earlier stages, with a view to more effectual results in eradicating the disease and at the same time avoiding, as far as possible, distress to patients and their friends.

OFFICERS: EXECUTIVE. W. F. Frear, governor; E. A. Mott-Smith, secretary; C. R. Hemenway, attorney-general; A. J. Campbell, treasurer; J. W. Pratt, commissioner public lands; M. Campbell, superintendent public works; W. H. Babbitt, superintendent public instruction.

Delegate to Congress, J. K. Kalanianaʻole.

JUDICIARY. A. S. Hartwell, chief justice, Supreme Court; A. A. Wilder, associate justice, Supreme Court; S. M. Ballou, associate justice, Supreme Court.

HAY. Owing to the low price because of a large yield, hay in 1908 lost its relative place in total crop value, ranking this year under cotton, which never before occurred in American agricultural history. The total farm value of the year's crop on December 1 was \$635,423,000, as compared with \$743,507,000 the year before. The value per ton on December 1, in 1908 and 1907 was \$8.98 and \$11.68, respectively. The total production in 1908 never was exceeded, and the total value of the crop was surpassed but once, namely, in 1907. The quantity produced amounted to 70,798,000 tons, while in 1907 it was only 63,676,000 tons, but a difference of \$2.70 per ton in value in favor of the smaller yield gave it first place in value of total crop. The area devoted to hay in 1908 was 46,486,000 acres, and the average yield 1.52 tons per acre, while in 1907 the average was 44,028,000 acres, and the average yield per acre 1.45 tons. Among the States, Iowa ranked first in production, with 6,460,000 tons; New York second, with 5,717,000 tons; Illinois third, with 4,743,000 tons; Pennsylvania fourth, with 4,677,000 tons; Ohio fifth, with 4,590,000 tons, and Missouri sixth with 4,350,000 tons. The average yield per acre in the different States ranged from .92 of a ton in New Hampshire to 3.25 tons in Idaho. In Iowa the average yield was 1.70 tons and in New York 1.20 tons per acre. A large proportion of each year's hay crop is furnished by alfalfa and the quantity produced is increasing from year to year.

HEADLAM, WALTER GEORGE. An English Greek scholar, died on June 19, 1908. He was born on February 15, 1866, and was educated at King's College, Cambridge, where he graduated as Porson prizeman in 1887, having received seven Browne medals in 1885-87. In 1890 he became a fellow of King's College, and in 1906 he was a candidate for the Regius professorship of Greek at Cambridge. Headlam's particular field was the criticism of the newly discovered (1890) text of Herondas, and he also devoted much of his time to Greek tragedy. He translated into English prose *Æchylus's Supplices* (1900), the *Agamemnon* (1904), the *Choëphori* (1905), the *Eumenides* and the *Prometheus* (1908); and at his death he had in the press an edition of the *Fragments of Sophocles* to complete Jebb's edition of that poet. His *Book of Greek Verse* (1907) contains versions into Greek.

HEARST, WILLIAM RANDOLPH. See PRESIDENTIAL CAMPAIGN.

HEBERT, ANTOINE AUGUSTE ERNEST. A French historical painter, died on November 5, 1908. He was born at Grenoble in 1817. He studied law at the University of Paris, and later studied sculpture under d'Angers, but was finally persuaded by Delarouche to adopt painting as his life work. His first picture, "Tasso in Prison," exhibited at the Louvre in 1839, found a permanent home in the museum at Grenoble. He won the Prix de Rome in 1839, and went to Italy, where he remained until 1847. His "La Malaria," painted immediately after his return to France, was bought by the government for the Luxembourg. Several of his other paintings are famous, "The Daughters of Alvito," painted for the Paris Exposition of 1855, being especially notable. Besides his larger works, Hebert painted numerous portraits. He was professor of painting at the École des Beaux Arts.

HEDIN, SVEN ANDERS. See EXPLORATION.

HELIUM, LIQUEFACTION OF. See CHEMISTRY.

HEPBURN LAW. See RAILROADS.

HIBBERT, SIR JOHN TOMLINSON. A British politician, died on November 7, 1908. He was born in 1824, and was educated at Shrewsbury and at St. John's College, Cambridge. He was admitted to the bar in 1849, and entered Parliament in 1862 as Liberal member for Oldham. He served until 1874 and again from 1877 to 1886, and from 1892 to 1895. After serving in minor positions under various Liberal governments, he became parliamentary secretary of the Treasury in the Gladstone and Rosebery Ministries from 1892 to 1895.

HILL, DAVID JAYNE. An American diplomat, was confirmed by the Senate as Ambassador to Germany on April 2, 1908. It was rumored that objections were raised by the German Emperor to the appointment, because of a feeling that he was not sufficiently wealthy to uphold the lavish standard of entertainment which marked the tenure of his predecessor, Charlemagne Tower. But this was disavowed officially by the German Ambassador. See UNITED STATES, section *Diplomatic Service*. Mr. Hill was born in Plainfield, N. J., on June 10, 1850, and graduated at Bucknell University in 1874. He was president of Bucknell from 1879 to 1888, and of the University of Rochester from 1888 to 1896. He had made a special study of international law, was appointed Assistant Secretary of State in 1898, minister to Switzerland in 1903, and to the Netherlands in the same year. During his stay at The Hague he was a member of the Administrative Council of the Permanent Court of Arbitrators. He has written extensively on the history of diplomacy.

HISCOX, GARDNER DEXTER. An American engineer, died on Sept. 13, 1908. He was born in Elizabethtown, N. Y., in 1822, taught school for a while, and thereafter devoted himself to scientific and technical work. He made an especial study of mechanics, and particularly of motor vehicles, and published on such subjects: *Gas, Gasoline, and Oil Vapor Engines*, (1898); *Mechanical Movements, Powers, Devices and Appliances Used in Construction and Operative Machinery and the Mechanical Arts* (1899); *Compressed Air, its Production, Uses and Application as a Motive Power* (1901); *Horseless Vehicles, Automobiles, Motorcycles Operated by Steam, Hydro-carbon, Electric and Pneumatic Motors* (1901); and he edited *Henley's Twentieth Century Book of Receipts, Formulas and Processes* (1907).

HISGEN, THOMAS L. Presidential candidate of the Independence party in 1908. He was born at Petersburg, Ind., on Nov. 26, 1858, received but a meagre education, and, when sixteen years old, entered his father's clothing store at Albany, N. Y., as a clerk. Later, in conjunction with his brothers, he started a factory for the manufacture of axle grease, a business which the father had been interested in for some years, but which he had been unable successfully to establish. The brothers in time established a large and paying business, and thereby came into competition with the Standard Oil Company. A bitter fight followed the refusal of the brothers to sell their plant to the Standard, and resulted in the Hisgens going

into the oil business for themselves. In 1907 Mr. Hisgen was the candidate of the Independence League for Governor of Massachusetts, and polled 75,489 votes. This showing made him a prominent figure in the Independence party, an outgrowth of the Independence League, and on July 29, 1908, he was made the Presidential nominee of that party. See **PRESIDENTIAL CAMPAIGN**.

HISTORICAL ASSOCIATION, AMERICAN. Society for the promotion of historical studies, founded in 1884 and incorporated by Act of Congress in 1889. It had a membership in 1908 of about 2300. The twenty-fourth annual meeting of the Association was held in Washington, D. C., and Richmond, Va., on Dec. 28-31, 1908. The annual address was delivered by Hon. James Bryce, British Ambassador. The subject was, "The Relation of Political Science to History and to Practice." The following were among the important papers read at the meeting: "The Use of Census Materials in American Economic and Social History," James A. Hill; "The American Newspapers of the Eighteenth Century as Sources of History," William Nelson; "The Use of Newspapers for the History of the Period from 1850 to 1877," James Ford Rhodes; "The Use for Historical Purposes of the Newspapers for the Last Thirty Years," Talcott Williams; "Associated Press Dispatches as Materials for History," Melville E. Stone. Conferences were held on the following subjects: The Relation of Geography to History; The Influence of the Geography of the South Atlantic States on Their History; The History in Secondary Schools. Other papers were: "Normandy under William the Conqueror," Charles H. Haskins; "The Movement of European Expansion Led by Prince Henry of Portugal," Raymond Beasley; "Religious Toleration in Brandenburg-Prussia under the Great Elector," Oliver H. Richardson; "Chatham, 1808-1908," Charles W. Colby; "Grant's Conduct of the Wilderness Campaign," General Edward P. Alexander; "Lee's Conduct of the Wilderness Campaign," Col. William R. Livermore; "The Wilderness Campaign, from the Present Point of View," Major Eben Swift. The officers of the Association are as follows: President, George B. Adams; first vice-president, Albert Bushnell Hart; second vice-president, Frederick J. Turner; secretary, A. Howard Clark; corresponding secretary, Charles H. Haskins; treasurer, Clarence W. Bowen.

HITCHCOCK, FRANK HARRIS. An American politician and government official. He was born at Amherst, Ohio, on October 5, 1867, graduated at Harvard in 1891, and at the Columbian University Law School in 1894, and was admitted to the bar of the District of Columbia in 1894. Since his graduation from Harvard he has been almost continuously in the government service. He was chief of the division of foreign markets in the Department of Agriculture, chief clerk in the Department of Commerce and Labor, member of the Keep Commission, and first assistant postmaster-general, which position he resigned in 1908 to take charge of Mr. Taft's campaign for the Republican Presidential nomination. His effective work for Mr. Taft in the South and West contributed greatly to the latter's success in the Republican National Convention in June. In the following month Mr. Hitchcock was unanimously chosen chairman of

the Republican National Committee, and as such directed the campaign which resulted in Mr. Taft's election. Shortly after the election it was announced that Mr. Hitchcock would enter Mr. Taft's cabinet as Postmaster-General.

HOCKEY. The hockey season of 1908 was the most successful one in the history of the sport. The Saint Nicholas Skating Rink in New York City, as in previous years, was the scene of a large majority of the games played both by the teams belonging to the Amateur Hockey League and by the Intercollegiate Hockey League. The championship of the Amateur Hockey League was won by the Crescent Athletic Club, with eight games won and no games lost. The standing of the other teams in the league was: New York Athletic Club won 5 and lost 3. Saint Nicholas Hockey Club won 5 and lost 3. Hockey Club of New York won 2 and lost 6, and Wanderers' Hockey Club won 0 and lost 8. Since 1900 the Crescent Athletic Club has won the championship seven times, the Wanderers' Hockey Club once, and the Saint Nicholas Hockey Club once. The intercollegiate championship was won by Yale, which finished the season without defeat. Harvard, which, because of the excellent form shown in the early season games, was regarded a sure winner, ranked second, with three games won and one lost. Princeton, Dartmouth and Columbia, the three remaining teams in the league, each won one game and lost three. The intercollegiate championship of Canada was won by the University of Toronto team, which afterward visited the United States and defeated the champion Crescent Athletic Club team 12 goals to 3. The Victoria team of Montreal also made a trip to the United States, defeating the New York Athletic Club by a score of 8 to 6. The Stanley Cup in Canada was won by the Wanderers of Montreal.

HOG CHOLERA. See **VETERINARY MEDICINE**.

HOGS. See **STOCK RAISING**.

HOLLAND. See **NETHERLANDS**.

HONDURAS. A republic of Central America. Its area is estimated at 44,274 square miles. Its population, mostly Indians, numbered 500,136 at the end of 1905. The principal cities, with their estimated population, are: Tegucigalpa, the capital, 35,000; Juticalpa, 17,800; Nacaome, 12,000; La Esperanza, 11,500; Santa Rosa, 10,900; Choluteca, 10,800; San Pedro Sula, 10,000; Danli, 9,000.

EDUCATION. For primary instruction there are about 850 public schools, with 30,000 pupils. Nearly four-fifths of the population are illiterate. A normal school for women had 236 students in 1906; in the same year a normal school for men was opened with 201 students. There are several schools for secondary instruction, the one at Tegucigalpa being maintained by the central government, and others receiving aid from it. At Tegucigalpa there is a university with facilities of science, medicine, law, and political science. At Camayagua there is a school of law. In 1908 the government decided to establish a school of agriculture at Danli.

PRODUCTION. The mineral resources include gold, silver, platinum, copper, lead, zinc, nickel, tin, bismuth, antimony, iron, cinnabar, opals, petroleum, salt, alum, sulphur, and coal, but

their exploitation is awaiting the development of means of transportation. The New York and Honduras Rosario Company produced in 1907 923,538 ounces of silver and 11,950 ounces of gold, its total production of bullion from 1882 to 1907 having amounted to \$13,214,463. The chief agricultural product is bananas, of which 4,266,567 bunches were exported during the year ending July 30, 1907. The export of rubber from Puerto Cortés during 1906-7 amounted to 44,280 pounds, against 46,346 pounds during the preceding year. At least nine-tenths of the rubber obtained is of wild growth, and of the very best grade. A large number of trees were being ruined by continued tapping, while most of those that have recently been planted had not matured. Coffee, tobacco, sugar, maize, oranges, lemons, beans, indigo, sarsaparilla, rice, and wheat are also produced. The sugar is mostly used in the making of rum. Cattle breeding is carried on extensively, and there is a considerable export of cattle. The forests are rich in hardwoods, such as mahogany and cedar.

FOREIGN COMMERCE. During the year ending July 30, 1907, imports amounted to \$2,331,517, and exports \$2,012,410. The leading exports were: Bananas, \$930,916; mineral ores, \$444,333; live animals, \$136,016; bar silver, \$132,168; hides, \$66,314; cocoanuts, \$62,760; dye and cabinet woods, \$41,268; rubber, \$38,745. The bulk of the trade is with the United States, imports of which amounted to \$1,561,855, and exports to which, \$1,807,953. Imports from and exports to Great Britain were \$269,557 and \$9,612, respectively; Germany, \$209,089 and \$50,756. According to United States returns for the fiscal year 1907-8, imports from Honduras amounted to \$2,268,070, and exports to Honduras, \$1,768,995.

COMMUNICATIONS. There is a fifty-seven mile railway from Puerto Cortés to San Pedro Sula and Pimienta; in 1908 it was leased by the government for a period of twelve years, the lessee undertaking to reconstruct it and to build at least twenty-five miles of branch lines into the adjacent banana country. On the northern coast a line of thirty miles has been constructed by a private company from the port of Ceiba, providing an outlet for the fruit products of the Zacate valley. A good wagon and automobile road has been opened from Tegucigalpa to San Lorenzo, on the Pacific. The length of telegraph wire in 1908 was 2,842 miles.

FINANCE, ETC. For the fiscal year 1906-7 the revenues amounted to 2,828,386 silver pesos (each worth about 39.3 cents in July, 1908), and the expenditures, 4,023,350 pesos. The budget for 1908-9 balanced at 3,703,216 pesos silver. In July, 1907, the foreign debt amounted to \$105,195,885, including arrears of interest. The internal debt stood at 3,125,993 pesos at the end of 1906. The regular army numbers 500 men of all grades for which the annual budget carries an appropriation of about 1,200,000 pesos. The militia numbers about 20,000 men. In 1908 Dr. Miguel R. Davila was President.

HISTORY. In July, 1908, there was an insignificant uprising, which was easily put down. The insurgents were anxious to secure the leadership of ex-President Manuel Bonilla, who was deposed in 1907, but he repeatedly asserted that he had nothing to do with the attempted rising. In connection with these troubles the

American gunboat *Marietta* was sent to Belize. For an account of the cancellation of the exequaturs of all foreign consuls at Ceiba, and the negotiations resulting therefrom, see **UNITED STATES**, paragraphs on *Foreign Relations*. President Davila preferred charges to the Central American Court of Justice at Cartago, Costa Rica, against the governments of Guatemala and Salvador, for having organized and supported the revolt. In December the court gave a verdict in favor of the defendant countries. On March 2, 1908, President Davila decreed the organization of a Department of Agriculture. On March 24 a postal convention with Mexico was ratified, and on May 28 President Davila signed a treaty of friendship, commerce, and navigation with Mexico. In June the President referred for ratification to the National Congress a naturalization convention with the United States. See **CENTRAL AMERICA**; **INDUSTRIAL ARBITRATION**.

HONDURAS, BRITISH. See **BRITISH HONDURAS**.

HONGKONG. A British crown colony, off the southeast corner of China, consisting of the island of Hongkong, thirty square miles; the peninsula of Kowloon, ceded in 1866; and the Kowloon lease of 1898, 341 square miles. Total area, 389 square miles; total population (1907), 414,308, of whom 395,591 were Chinese. The white population included 18,777 military and naval persons. Victoria, the capital, had 185,000 inhabitants in 1907. In 1907 there were seventy-nine government-aided schools, with 5,924 pupils, besides a number of schools receiving no aid. The industries include sugar refineries, cement, brick, rope, matches, glass, soap, soda, ice, paper, vermilion, and other factories, engineering and shipbuilding works, etc. Hongkong is a free port, and there are no returns of the amount, origin, or destination of its foreign commerce. The shipping entered in 1907 aggregated 18,013,387 tons. There are twenty-two miles of railway and sixty-seven miles of telegraph line. The revenue in 1907 was 6,602,280 dollars; the expenditure, 5,757,293 dollars, and the public debt, £341,799. The military force stationed in 1908-9 numbered 4,256. The Governor in 1908 was Sir F. J. D. Lugard.

HISTORY. At the end of May forty-seven cases of the plague were reported. A resolution was passed by the House of Commons in May urging speedy measures to close the opium dens now existing in some of the Crown Colonies, especially in Hongkong, and in the course of the debate it was announced that the government had already decided to suppress all the Hongkong opium dens. Hongkong was visited by a severe typhoon on July 27, and much damage was done to both shipping and buildings. The loss of life was estimated at over 1,000 and a large number of European and native vessels were sunk, driven ashore, or otherwise damaged. The anti-Japanese boycott was joined by Chinese inhabitants of Hongkong and resulted in disturbances. On November 1, a mob wrecked a number of Chinese stores, for the reason, it was said, that the merchants showed a tendency to abandon the boycott. There were conflicts with the police and some of the rioters were wounded. Over 100 arrests were made and many of the agitators were punished. The movement was inspired from Canton, where anti-Japanese feeling was

still very strong. An organization had been formed in Canton and Hongkong to stir up the people against the Japanese and had posted warnings to those who continued to deal in Japanese goods. In December, the China Association protested to the government against the banishment of Chinese merchants and the government replied that no more banishments would be ordered if the merchants did not continue the boycott. Threats were made towards the end of the year of a boycott of British goods in revenge for the punishment of the anti-Japanese boycotters.

HOPKINS, HENRY. An American clergyman and president of Williams College, died on October 18, 1908. He was born in Williamstown, Mass., on November 30, 1837; graduated at Williams College in 1858; studied at Union Theological Seminary in 1859-60, and entered the congregational ministry in 1861. From 1861 until 1864 he served as army hospital chaplain at Alexandria, Va. He went to Westfield, Mass., in 1866 as pastor of the Second Congregational Church; four years later he moved to Kansas City, Mo., and held a pastorate there until 1902. From 1902 until the early part of 1908 he was president of Williams College. See **GARFIELD, HARRY AUGUSTUS**.

HOPS. The hop production of the United States for 1908 was estimated at 37,800,000 pounds, or about 16,000,000 pounds less than in 1907. The total farm value of this yield was about \$4,000,000. This yield and value had been exceeded many times. The prices in 1907-1908 ranged from 2 to 12 cents per pound, and this was so unsatisfactory to the growers that many of them, as reported from New York State, were abandoning their hop yards to turn their attention to dairying and other lines of farming. Low total yields were also secured this year in Russia and Germany. R. H. Rew pointed out in the *Mark Lane Express*, of London, that a comparison of data for the years 1885-7 and 1905-7 revealed a reduction in the world's acreage of 15,338 acres, or about 5 1-4 per cent. During these twenty years the area devoted to hops had increased in the United States, Austria-Hungary, Canada, Tasmania, and New Zealand, and had decreased in England, Belgium, France, Germany and Holland by more than 48,000 acres, or about 23 per cent. This writer further calls attention to the fact that the world's consumption of hops is slowly but certainly decreasing and suggests that the acreage be adjusted to requirements by an international movement among the growers. Germany, in 1908, grew 88,586 acres of hops, which produced 57,947,120 pounds, or an average of 650 pounds per acre. Since 1886 a gradual decrease in acreage had taken place and the acreage of 1908 was the smallest in thirty years. The heaviest crops this season were produced in Alsace-Lorraine, where the average yield reached 926 pounds per acre. In Russia an unfavorable season resulted in the poorest yield for a decade, the crop being only about 60 per cent. of the normal average. The total yield was 9,750,240 pounds, as compared with 12,639,200 pounds in 1907. England produced 47,068,360 pounds on 38,916 acres, the average yield being over 1,200 pounds per acre. Many brewers and hop experts in the United States were of the opinion that the quality of American hops might be improved by curing at lower

temperature, breeding disease-resistant types, selecting the best and most productive individuals, and keeping the varieties pure. Germans pointed out that hops were of a much higher brewing value when air-dried than when kiln-dried. Curing at high temperature not only reduces the weight, but also causes a loss in their most valuable constituents. Under favorable weather conditions hops spread out in thin layers in the open air will dry out and retain their color perfectly. English hop growers were urging the passage of a bill prohibiting the use of hop substitutes in the brewing of beer and providing for the marking of imported hops, the name of the owner, planter or grower, the country and the year in which grown, and the gross weight being required on the bags in which the hops were shipped. Importations must be made in bags.

HORSE-RACING. See **RACING**.

HORSES. See **STOCK RAISING**.

HORSTMANN, IGNATIUS FREDERICK. A Roman Catholic Bishop, of Cleveland, Ohio, died on May 13, 1908. He was born at Philadelphia on December 16, 1840, attended the Jesuit College at Glen Riddle, Pa., and later graduated at the American College in Rome, from which institution he received the degree of D.D. in 1866. He was ordained a priest in 1865, and from 1867 to 1877 taught in St. Charles Seminary, Philadelphia. In 1877 he became pastor of St. Mary's Church, Philadelphia, where he remained until his appointment as Chancellor of the archdiocese of Philadelphia in 1885. He was consecrated bishop of Cleveland in 1892. He was assistant editor of the *American Catholic Quarterly Review* in 1889-92 and edited Nampon's *Catholic Doctrine as Defined in the Council of Trent*.

HORTICULTURE. Doubtless the unsettled business conditions of the year 1908 hindered to some extent the growth and expansion of commercial horticulture in the United States. In the fruit industries, growers received less for their crops, although, with the exception of orchard fruits in the Pacific Coast region and the Southern peach crop, 1908 was not an overabundant fruit year. Packers, canners, and distributors experienced difficulty in disposing of their outputs in the large domestic markets. Many new small markets for future crops were developed, however, and there was a considerable increase in the exports of canned goods to England. The trans-Atlantic shipment of apples from the United States and Canada during the season of 1907-08 was 2,469,528 barrels and exceeded that of the three preceding seasons. The exports of domestic oranges and the home consumption of American lemons continued to increase. The short 1907 apple crop was finally figured at 29,000,000 barrels, and the crop for 1908 was believed to be several hundred barrels less. Georgia shipped over 4000 cars of peaches in 1908, and California shipped 10,700 cars of fresh deciduous fruits, other than apples and mixed lots, as compared with 6400 cars in 1907. During the season of 1907-08, California produced 27,500 cars of oranges and 5000 cars of lemons, and Florida about 4,000,000 boxes of oranges. The prune crop was the shortest and the apricot the heaviest for several years past. The total yield of grapes was lower than in 1907. California packed only 139,500 tons of dried fruits as against 153,100 tons in 1907.

The estimates for the total tomato, corn and pea packs for the season of 1908 were 11,479,000 cases, 6,779,000 cases and 5,577,000 cases, respectively.

The canned pineapple industry in Hawaii, though scarcely six years old, had already assumed commercial importance. The 1908 pack was estimated at 400,000 cases; to be shipped chiefly to the mainland of the United States. The total wine yield of the United States was estimated at 31,750,000 gallons, which is 11,741,554 gallons less than California's wine production for 1907. Many wine makers went into the grape juice business, to meet the growing demand for that product.

FRUIT MARKETING AND STORAGE. The influence of the recent investigations of Powell and associates of the Department of Agriculture, in which the decay of California oranges shipped East was found to be almost entirely due to improper methods of harvesting, packing, and shipping, was very much in evidence. Improvements in methods of handling labor, together with the readjustment and remodeling of many of the packing houses, resulted in a reduction of two-thirds of the losses due to decay. These losses formerly averaged about \$1,000,000 annually. In connection with these investigations it was found that when the fruit was cooled to 40 degrees F. or lower previous to shipment the temperature remained nearly constant if the cars were re-iced regularly in transit. It remained fairly constant in cool weather without additional icing after the cars left California, and in warm weather the cars needed re-icing only during the last half of the trip. Pre-cooling retarded decay and was recommended as an adjunct to careful handling. It was tried on a commercial scale and found to be a practical success financially. Several pre-cooling plants were to be erected during 1909. Investigations commenced with the Florida orange crop indicated that with careful methods of handling, the results secured in California could be duplicated. Likewise, investigations in the marketing and storage of California table grapes brought out the fact that decay did not take place unless the skin of the berry was broken, whether by insects, mechanical injuries or other causes. The grapes rotted least in transit and after arrival in the East when the fruit had been picked and packed with great care and was shipped quickly after packing. The storage and shipping qualities of the grapes were greatly improved by packing in cork dust. In a storage test of a number of varieties of table grapes it was found possible to hold them from sixty-five to one hundred days in excellent condition when packed in fine ground cork, where similar fruit packed in the ordinary commercial way could be held but from ten to twenty days. This work brought out the possibility of largely supplanting the importation of foreign grapes with the California crop.

The Hawaii Agricultural Station demonstrated by extensive shipping experiments that fresh pineapples can be readily shipped from Hawaii to any point within thirty days' direct communication with Honolulu, and that such fruits as avocados and papaias could be marketed in good condition in all of the large cities near the Pacific Coast. The growers took active steps toward the systematic development of a fresh fruit trade in the western part of the United States.

The State experiment stations were actively engaged in solving various horticultural problems, and many bulletins of practical value were issued during the year. Tests conducted at the New Hampshire Station for two seasons showed the importance of placing fancy apples, intended for long keeping, in cold storage as soon as possible after picking. It was found that the apples respire, thus losing weight, from four to six times as fast at summer temperatures as in cold storage, and from two to three times as fast in cool cellars as in cold storage.

The importance of finding out what a given wine grape variety will do as to color in any particular section, before making extensive plantings, was clearly brought out by the California Station, where it was found, on testing the color capabilities of numerous varieties of wine grapes from different sections of the State, that a variety which has abundant color in one locality may have almost none in another. The color of all varieties was less in quantity and less stable in character in the warmer climates and richer soils.

PEACH, APRICOT AND PRUNE KERNELS AS BY-PRODUCTS OF THE FRUIT INDUSTRY. Almond oil and bitter-almond oil are practically all produced in Europe and are often either represented by or diluted with oils derived from peach and apricot kernels. The Department of Agriculture found that the physical and chemical properties of fixed and volatile oils produced from peach, apricot and prune kernels corresponded in a striking degree to those of the almond oils. In view of the large supply of peach, apricot and, to a lesser extent, prune kernels annually available in this country, and which are largely waste products of the dried and canned fruit industries, the adulteration or synthetic production of almond oils was deemed unnecessary. The attention of fruit men and oil importers was directed to the possibility of the cheap domestic production of a class of oils which could be used for the same purposes as the almond oils. The adaptability of canneries, and other establishments already equipped with power, for producing these oils at a comparatively cheap cost was also pointed out.

PLANT BREEDING. Many new varieties of fruits, flowers and other plants were announced by commercial breeders. Scientific men, likewise, reported progress. As a result of several years' work, P. K. Blinn, of the Colorado Station, developed a rust-resistant cantaloupe which was successfully tried in various sections of the country. Hansen continued to get good results from his work in South Dakota. Some of the best of his third generation seedling sand cherries were producing fruits 1 inch in diameter and of good quality. Some promising new fruits have been originated by crossing the native Dakota plums and sand cherries with other stone fruits from Europe and Asia. Certain of these hybrids combine the hardiness and early fruiting character of the sand cherry with something of the size and quality of the choice cultivated fruits from abroad. There was an increasing interest everywhere in the attempt to verify Mendel's laws of hybridization and to seek out new truths connected with the growth of plants.

LITERATURE. A large proportion of the horticultural works which appeared in 1907 and 1908 were devoted to different phases of land-

scape gardening and floriculture. Of these may be mentioned: *The Art of Landscape Gardening*, by H. Repton (Boston and New York, 1907). This is the first of a series of classics in landscape architecture undertaken at the suggestion and with the coöperation of the American Society of Landscape Architects. The volume contains two of the best works of Humphrey Repton, an early English landscape gardener, as follows: "Sketches of Landscape Gardening," published in 1795, and "Theory and Practice of Landscape Gardening," published in 1803. Other prominent horticultural books are: Vol. 3 of *Gardens, Old and New*, edited by H. A. Tipping (London and New York, 1908); H. Maxwell and Miss M. G. W. Wilson, *Scottish Gardens* (New York and London, 1908); R. Farrar, *My Rock Garden* (London, 1907); H. B. Dorner, *Window Gardening* (Indianapolis, 1908); T. Baker, *Yard and Garden* (Indianapolis, 1908); H. S. Connard and H. Hus, *Water-lilies and How to Grow Them* (New York, 1907); J. H. Pemberton, *Roses; Their History, Development and Cultivation* (London and New York, 1908); P. L. de Vilmorin, *Manuel de Floriculture* (Paris, 1908); P. Hubert, *Ananas* (Paris, 1908); L. Degruilly, *L'olivier* (Montpellier, 1907). *Iowa Horticulture*, a monthly bulletin of plant life published by the Iowa State Horticultural Society, as well as two general horticultural monthlies, *Orchard and Farm* (San Francisco) and *Porto Rico Horticultural News* (San Juan, Porto Rico), appeared for the first time in 1908.

HOSLEY, HARRY HIBBARD. Commander U. S. Navy, who won fame as the commander of the towing expedition which took the dry-dock *Decey* from Chesapeake Bay to the Philippines, died on January 6, 1908. He graduated at the Naval Academy in 1875, became a lieutenant in 1889, lieutenant-commander in 1899, and commander in 1904. In December, 1905, he was placed in command of the dry-dock towing expedition. The expedition started on December 26, 1905, towing the great dry-dock, which has a displacement of 11,000 tons, and can lift a 20,000 ton battleship. The voyage was made by way of the Mediterranean, the Suez Canal and the Indian Ocean. The dock broke away six times during the voyage, but was captured each time without injury. On July 10 the unwieldy craft was moored safely at Olongapo, after a voyage of 13,080 miles, which consumed 196 days. Commander Hosley had been supervisor of New York harbor since 1904.

HOSMER, HARRIET GOODHUE. An American sculptor, died on February 21, 1908. She was born in Watertown, Mass., on October 9, 1830. Much rough outdoor life—hunting, riding and boating—made strong and robust her naturally frail physique, and she was able, after taking a short course in modeling in Boston, to study anatomy with her father, a physician, and afterward at the St. Louis Medical College. She went to Rome in 1852, and in 1853 became the pupil there of John Gibson (1790-1866), the English sculptor of "Tinted Venus" renown (the only pupil he ever accepted), the association resulting in a warm personal friendship between the two. Her studio in Rome had once been occupied by Antonio Canova (1757-1822), the great Italian sculptor; and while she lived in the Eternal City she was on friendly terms with such celebrities

as Nathaniel Hawthorne, Thorwaldsen, Flaxman, Thackeray, George Sand and George Eliot; while in Florence she was frequently the guest of the Brownings at Casa Guidi. In Gibson's studio she modeled her original heads, "Daphne" and "Medusa" (for Samuel Appleton, of Boston); "Beatrice Cenci" (1857), for the public library of Saint Louis, and "Ænone" (1855), her first life-size figure. Her figure of "Puck" (1855), an original and spirited conception, she copied several times, on orders, two of the buyers being the Prince of Wales and the Duke of Hamilton. Her most pretentious work was the colossal statue, "Zenobia, Queen of Palmyra, in Chains," completed in 1859; others were the statue of Thomas H. Benton, in Lafayette Park, Saint Louis; "Sleeping Faun," exhibited in Paris in 1867, and considered one of her best efforts; "Waking Faun"; a statue of the Queen of Naples as the "Heroine of Gaëta"; a statue of Isabella of Spain, and a monument to Abraham Lincoln, for the World's Fair at Chicago; a fountain in Central Park, New York City, and two others in private possession in England.

HOSPITALS. In spite of the financial stringency during 1908 no diminution in hospital building was observable.

In New York City the commission appointed by the mayor in 1906 to plan for the reorganization and extension of the hospital system presented its report, recommending that the hospital service be administered by a separate commission, which shall also have charge of the public ambulance service. The report recommends the extension of the sanatorium for tubercular patients at Otisville, new buildings for poorhouse, workhouse and nervous diseases on Blackwell's Island, early completion of the Sea View Hospital on Staten Island, expediting the work of the new Bellevue Hospital and many other needed improvements. One new building at Bellevue Hospital was opened during 1908, and another was almost ready for occupancy. A gift of \$500,000 was made by Mr. J. D. Rockefeller to the Rockefeller Institute for Medical Research for the purpose of erecting and furnishing a hospital to adjoin the present plant. The new building, though comparatively small, and not providing accommodation for many patients, was to contain elaborate provisions for the comfort of those received, and every effort was to be made to develop new and exact methods of treatment which may then be applied elsewhere on a larger scale. The plans filed included a seven-story brick building and a two-story edifice for isolation wards, connected by steel bridges. The estimated cost was \$400,000. A new tuberculosis hospital was to be erected on Blackwell's Island as an annex to the Metropolitan Hospital, to cost \$250,000. It will have a roof garden 291 feet long with a large solarium at either end. The new annex of the German Hospital, to be used as an isolation department, was opened on March 21. It cost \$30,000, most of which was given by Jacob Ruppert. The Mount Moriah Hospital containing 80 beds and a children's ward was opened on the East Side. The Presbyterian Hospital was given a million dollars by its president, James S. Kennedy, to be used in the construction of new buildings. Frederick Hewitt, of Owego, bequeathed \$2,000,000 to the New York Post-Graduate Hos-

pital and School. St. Luke's Hospital received \$20,000 from Maria L. Campbell as an endowment fund for beds for the exclusive use of physicians. A new wing to St. John's Hospital, Long Island City, was dedicated.

In Pennsylvania the new City Hospital, Scranton, was formally opened Feb. 19. The Montefiore Hospital, Pittsburg, was dedicated May 1. The Eastern Pennsylvania State Institution for the Feeble-Minded and Epileptics, at Spring City, was opened Nov. 16. Six of the 23 buildings contemplated were finished. The total cost is to be about \$1,000,000, and the institution is to occupy over 300 acres. In Baltimore the Sydenham Hospital for Infectious Diseases and the Municipal Hospital for Infectious Diseases were completed.

The Municipal Tuberculosis Hospital in Washington, D. C., was opened on June 27.

In Illinois there were completed, or under way, a new isolation hospital and the new University Hospital, in Chicago; hospital buildings at Spring Valley, Peoria and Evanston. A State Tuberculosis Hospital was erected at Iowa City, Ia. In Colorado, the National Jewish Hospital for Consumptives, at Denver, doubled its capacity, and new hospitals were built at Silverton and La Junta. The German Hospital, San Francisco, was dedicated June 27. A new general hospital was opened at Selkirk, Manitoba, at a cost of \$25,000.

The first municipal sanatorium for consumption in England was opened by the Lord Mayor of Birmingham. It is situated on the side of the Cotswold Hills, 3 miles from Cheltenham. The site is 800 feet above sea level and well sheltered. The great empty hospital at Carshalton, built for contagious diseases, was used for the sick children of the various London infirmaries. These children numbered 2,000, and were in the crowded wards of the workhouse infirmaries. Consul General Iddings reported that the Egyptian government would equip and administer in Cairo a hospital for foreign patients suffering from cholera.

HOUGH, ALFRED LACEY. An American soldier, died at Princeton, N. J., on April 28, 1908. He was born in Burlington County, N. J., on April 23, 1826, and at the beginning of the Civil War was engaged in business in Philadelphia. After serving as sergeant with the three months' volunteers, he was commissioned a captain of infantry in the regular army, serving in the West throughout the war. He was on the staff of General Thomas from 1863 until the end of the war, and until that officer's death in 1870. He became major in 1874, lieutenant-colonel in 1882, colonel in 1888, and retired with that rank in 1890. He saw active service in the Sioux war of 1876-77 and the Ute outbreak in 1879. In 1904 he was made brigadier-general on the retired list for Civil War service.

HOUSTON, DAVID F. An American educator, appointed president of Washington University, St. Louis, Mo., in 1908. He was born in Monroe, N. C., on Feb. 17, 1866, and graduated at South Carolina College in 1887. The following year he became superintendent of schools at Spartanburg, S. C., where he remained until 1891, when he went to Harvard, engaging in graduate study until 1894. From 1894 until 1902 he was at the University of Texas, where he was successively adjunct professor, professor of political science, and dean of the faculty. He was

president of the Texas Agricultural and Mechanical College in 1902-05, when he became president of the University of Texas, which position he held when called to St. Louis.

HOWARD, (GEORGE) BRONSON. An American playwright, died on August 4, 1908. He was born in Detroit, on October 7, 1842. Forced by weak eyesight to discontinue his college course at Yale, he went to New York in 1868 and began newspaper work. During the next four years he was with the *Evening Mail*, the *Tribune* and the *Evening Post*. His first play, *Saratoga*, was produced by Augustin Daly, in 1870, and had a run—extraordinary in those times—of 101 nights. Thenceforward, his career as a playwright was almost uniformly successful. The most notable of his subsequent productions were: *The Banker's Daughter* (1878); *Old Love Letters* (1878); *Young Mrs. Winthrop* (1882); *One of Our Girls* (1885); *The Henrietta* (1887); *Shenandoah* (1889); and *Aristocracy* (1892). The last named is generally considered his best work. In 1899 he wrote *Peter Stuyvesant*, in collaboration with Brander Matthews. Although not a great dramatist—his plays are anecdotal rather than dramatic—he was one of America's best and most successful playwrights. He was particularly clever at writing parts to fit the individual peculiarities of those who played them, and many well-known American actors owe their first successes to him.

HOWARD, JOSEPH, JR. An American newspaper man, died on March 31, 1908. He was born in Brooklyn, N. Y., on June 3, 1833, and graduated at the Rensselaer Polytechnic Institute in 1857 as a civil engineer, but soon afterward became a member of the staff of the *New York Times*. As correspondent for the *Times* he accompanied the Prince of Wales during his tour in America (1860), and was at the front in the first stages of the Civil War. While a member of the staff of the *Brooklyn Eagle* he was sentenced to serve fourteen weeks in prison at Fort Lafayette for publishing a "bogus" presidential proclamation calling for 400,000 troops. He was owner and editor of the *New York Star* in 1868-76, when he became a member of the staff of the *New York Herald*, and in later years he supplied letters from New York for various out-of-town papers. In 1905 he was a witness in the New York insurance investigation, and testified that in six years he had received \$19,125 from the Mutual Life Insurance Company for matter supplied to newspapers.

HUBSCHMANN, JOHANN HEINRICH. A German philologist, died on Jan. 21, 1908. He was born in Erfurt, on July 1, 1848; was educated at Jena, Tübingen, Leipzig and Munich, and in 1875 became *privat docent* at Leipzig. In 1876 he became professor of Iranian languages at Leipzig, and in 1877 professor of comparative linguistics at Strassburg. His publications include *Armenische Studien* (1883); *Das indogermanische Vokal-system* (1885); *Etymologie und Lautlehre der ossetischen Sprache* (1887); *Armenische Grammatik* (1895 sq.).

HUGHES, CHARLES EVANS. Governor of New York. See NEW YORK and PRESIDENTIAL CAMPAIGN.

HUNTON, EPPA. An American Confederate soldier and politician, died in Richmond, Va., on Oct. 11, 1908. He was born in Fauquier

County, Va., on September 23, 1822; educated himself for the law and for several years before the war was prosecuting attorney for King William County, Va. He was a member of the Secession Convention of Virginia in 1861, became a colonel and later brigadier-general in the Confederate Army and fought throughout the war. He was a member of Congress from 1873 to 1881, and United States Senator from 1892 to 1895. He was a member of the Electoral Commission which decided the Hayes-Tilden disputed election in 1877.

HUTCHINSON, JOHN WALLACE. An American singer, the last of the famous "Hutchinson Family," died on Oct. 29, 1908, at Lynn, Mass. He was born in Milford, N. H., on January 4, 1821, the thirteenth of the sixteen children of Jesse and Mary (commonly called "Polly") Hutchinson, thirteen of whom grew up to manhood and womanhood. All of the family were singers. They made their first appearance in 1839, and by 1842 had become well known in New England through their concerts in which they sang abolition and temperance songs. In 1845-46 they gave a series of successful concerts in England, and they took an active and influential part in the Republican campaigns of 1856 and 1860. In January, 1862, they visited the camp of the Army of the Potomac, a pass having been issued to them by Simon Cameron, then Secretary of War. This pass was revoked on the order of General McClellan, but permission to continue the concerts was afterward renewed, at the instance of President Lincoln, to whom the family sang, at his request, in the Green Room of the White House. The singing career of the subject of this sketch extended over 60-odd years, during which he participated, it is said, in more than 11,000 concerts. He organized the American Temperance Union in 1866, and in 1855 founded the town of Hutchinson, Minn. He published *The Granite Songster* (1848), and *Story of the Hutchinsons* (Boston, 1896).

HYGIENE. Interest in subjects pertaining to public health and sanitation was never more intense than in 1908. Both Democratic and Republican platforms proposed the organization of all existing national public health agencies into a national bureau or department with or without a cabinet officer at its head, and both political parties committed themselves to advance legislation along sanitary lines. The suppression of the plague in San Francisco (see PLAGUE) and of yellow fever in New Orleans and Havana, the successful campaign against impure foods and dangerous drugs, the fight against tuberculosis, have both provoked and shown forth the popular interest in hygienic matters, and aroused full realization of the enormous economic losses due to inefficient sanitation. Ways and means were considered for the establishment of schools of sanitary science, and President Butler of Columbia University appointed a committee to report on a plan for such a school in connection with that institution. Dr. N. E. Ditmars, the chairman of this committee, in a preliminary report, urged the establishment of two courses of study, one leading to the degree of Public Health Officer, the other a course in the work of sanitary inspection. A movement for the diffusion of sanitary knowledge called the "Louisiana System of Hygienic Education" consists in the holding of

"Institutes of Hygiene," under the authority of the State Board of Health, before colleges, high schools and other like institutions. The aim is to secure "the perfect correlation of the clergy of all denominations, educators, scientists and the press, with the health service of the State in its educational efforts." The principles of this scheme have been adopted in France and Greece. Wainwright called renewed attention to the evils of bituminous coal smoke and showed that it interferes with the health of the community in several ways. 1. By leading to fog and rain; 2. By shutting out sunlight and depriving us of certain qualities of light which are of importance in producing changes in organic matter; 3. By depositing soot. A smoky atmosphere by its exclusion of light, its content of acid and irritating particles is harmful to the tissues of the eyes, air passages and lungs; it aggravates the sufferings of those afflicted with heart, lung, or nervous affections; lowers the tone of the general health; is a peril to the old; and decreases buoyancy of spirit. S. G. Dixon, Health Commissioner of Pennsylvania, believing that sewage infected water might be one means of disseminating tuberculosis in view of the fact that thousands of human beings are expectorating or excreting tuberculous matter, undertook the examination of samples of sewage from various sources in Philadelphia. Many specimens were found to contain the bacilli. The results of the work, while not conclusive, point to the possibility of infection in this way. See TUBERCULOSIS and SANITATION.

ICE AGE. See GEOLOGY.

ICE HOCKEY. See HOCKEY.

ICELAND. See DENMARK, *Colonies*.

ICE YACHTING. The principal contests of the ice yachting season of 1908 took place on the Shrewsbury River, N. J. The Commodore's Cup Race was won by the *Eagle*, which covered the course of 15 miles in 31 minutes 20 seconds, establishing a new record. In one leg of this race the *Clarel*, in a straightaway course, covered 1.2 miles in 31 seconds. The Price Brothers' Cup and the Pott's Cup races were both won by the *Drub*, whose best time for the 15 miles was 41 minutes 30 seconds.

IDAHO. One of the Western Division of the United States. Its extreme length from north to south along the western boundary is 495 miles, and the width varies from about 50 miles in the north to nearly 300 miles in the south. The area of the State is 84,313 square miles, which includes 534 square miles covered by lakes. According to the Federal estimate, the population in 1908 was 220,351. The largest cities are Boise, the capital, with an estimated population of about 20,000, and Pocatello, 3,500.

MINERAL PRODUCTION. The total value of the mineral products of Idaho in 1907 was \$21,300,612, a decrease from the figures of 1906, which were \$22,721,174. The most valuable mineral production of the State was lead, of which there were produced 112,569 short tons, valued at \$11,932,314, as compared with 117,117 tons in 1906, valued at \$13,351,338. Next in value of production ranks silver, of which there were produced in 1907 7,888,400 fine ounces, valued at \$5,206,300. The silver produced in 1906 was 9,018,815 fine ounces, valued at \$6,042,606. The gold produced in 1907 was 60,754

fine ounces, valued at \$1,255,900, while there were produced in 1906 55,547 fine ounces, valued at \$1,149,100. Copper showed an increase in production in 1907 over the figures of 1906. In the former year there were produced 9,707,299 pounds, valued at \$1,941,460, as compared with 8,578,046 pounds in 1906, valued at \$1,655,563. Other mineral productions of the State are lime, salt, silver, stone and zinc.

While depression was prevalent throughout the State in the early part of 1908, and metal prices were comparatively low during the entire year, the mining industry was in a progressive condition. This was shown rather by active development work, the building of new reduction plants and the proving of virgin territory, than by figures of production. The gold mining industry more than held its own, but the production of silver and lead showed decrease. Many new mines were developed and several additional smelters were built during the year. The Director of the Mint estimated the gold production of the State in 1908 at \$1,450,830, against \$1,255,900 in 1907, and the silver production at 6,289,585 fine ounces, against 7,888,400 fine ounces in 1907.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops of the State in 1908, according to the figures of the United States Department of Agriculture, were as follows: Corn, 174,000 bushels, valued at \$122,000, from 6,000 acres; winter wheat, 6,960,000 bushels, valued at \$5,150,000, from 232,000 acres; spring wheat, 3,937,000 bushels, valued at \$2,913,000, from 155,000 acres; oats, 5,588,000 bushels, valued at \$2,226,000, from 127,000 acres; barley, 2,132,000 bushels, valued at \$1,130,000, from 52,000 acres; rye, 40,000 bushels, valued at \$27,000, from 2,000 acres; potatoes, 1,950,000 bushels, valued at \$1,170,000, from 15,000 acres; hay, 1,410,000 tons, valued at \$10,011,000, from 443,000 acres. The production of wheat has increased steadily since 1900. Idaho is one of the few States producing beet sugar. The production in 1908 was estimated at 40,000 long tons from about 30,000 acres. The value of the hay crop was considerably increased in 1908 over the value of the crop for 1907, which was \$8,585,000. The average yield of hay in Idaho is the third largest in the United States. The number of farm animals on December 31, 1908, was as follows: Horses, 158,000; mules, 2,000; dairy cows, 76,000; other cattle, 347,000; sheep, 3,897,000; swine, 143,000. Since 1900 the number of dairy cows was increased about 12 per cent., while the total number of cattle has increased about 7 per cent. Idaho ranks third in the total production of wool, the amount in 1908 being estimated at 17,500,000 pounds, valued at \$2,945,250.

EDUCATION. Among the important educational measures passed at the last session of the Legislature were the following: A uniform text-book law; uniform eighth grade examination law; a strict compulsory education law; child labor law; the establishment of three State summer normal schools. A complete course of study and manual for the use of all schools of the State was prepared, based on a uniform series of books adopted for the State. The course of study for the grades articulates with that of the high schools and the State University. During 1908 a number of schools was organized under the consolidated plan. This

eliminated the one-room rural school. The movement toward a centralized school system in Idaho has taken a decided step toward progress. The three State summer normal schools have enabled over 600 teachers of the State to become better qualified for their work at a merely nominal expense. Lecturers of national reputation were secured for the season. The new compulsory education law caused a marked increase in the attendance.

FINANCE. The biennial report of the State Treasurer showed a balance on hand Oct. 1, 1906, of \$466,180.40; the receipts from Oct. 1, 1906, to Oct. 1, 1908, were \$4,664,324.56, and the disbursements for the same period were \$4,478,476.70. The balance at the close of business September 30, 1908, was \$652,028.22. The total bonded indebtedness of the State on the same date was \$1,364,000, an increase of \$285,000 during the preceding two years.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State are the Idaho Soldiers' Home at Boise City, which contains about 120 inmates; the Idaho State Insane Asylum, with about 250 inmates; the Northern Idaho Insane Asylum, at Clear Water; the Idaho Industrial Reform School in Fremont county, with about 70 inmates, and the Idaho State Penitentiary in Ada county, with about 220 inmates.

POLITICS AND GOVERNMENT. There was no meeting of the State Legislature in Idaho in 1908. On January 4 President Roosevelt requested the resignation of Ernest G. Eagleson, Surveyor-General of Idaho, and on June 13 United States District Attorney Ruick, who in 1907 brought charges of corruption against Senator William E. Borah, was removed from office by the President. In the trial of Senator Borah the jury declared that it found no evidence to substantiate these charges.

CONVENTIONS AND ELECTIONS. The Republican State Convention met at Wallace on May 13. Resolutions were passed indorsing the administration of President Roosevelt and the delegates selected were instructed to vote for William H. Taft for President. James H. Brady was nominated candidate for Governor. The Democratic State Convention met at Twin Falls on June 3. A division over the Mormon question in the State resulted in two conventions, and two full delegations were elected to the Denver convention. The convention's officers sided with the Mormon faction, but the majority of the delegates, led by former Senator Dubois, made a strong contest for control. When they failed, they drew aside, organized and elected delegates. The other faction elected delegates, one from each of the seven judicial districts and five from the State at large. In the election of November 3 the State was carried for William H. Taft by about 16,000 plurality, the national vote being: Taft, 52,606; Bryan, 36,080; Chafin, 1,740; Debs, 6,243. The entire Republican State ticket was elected.

OTHER EVENTS. Harry Orchard, whose sensational confession of murder in 1907 resulted in the trial of Charles H. Moyer, George A. Pettibone and William D. Haywood, officials of the Western Federation of Miners, pleaded guilty on March 10. On March 18 he was sentenced to death by Judge Fremont Wood, who made at the same time a strong recommendation that the sentence be not carried out. On July 1 the State Board of Pardons commuted the

sentence to imprisonment for life. The crime to which Orchard pleaded guilty was the killing of former Governor Steunenberg by the explosion of a dynamite bomb at Caldwell, December 30, 1905. In the trials brought as a result of Orchard's confession, Haywood and Pettibone were acquitted and the case against Moyer was dismissed.

STATE OFFICERS: Governor, James H. Brady; Lieutenant-Governor, Lewis H. Sweetzer; Secretary of State, Robert Lansdon; Treasurer, Charles A. Hastings; Auditor, S. D. Taylor; Attorney-General, D. C. McDougal; Superintendent of Education, S. Belle Chamberlain; Inspector of Mines, to be appointed; Superintendent of Agriculture, to be appointed—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, James F. Ailshie, Rep.; Associate Justices, Isaac N. Sullivan, Rep.; George H. Stewart, Rep.; Clerk, I. W. Hart, Dem.

The State Legislature of 1909 is composed of 15 Republicans and 6 Democratic Fusionists in the Senate and 39 Republicans and 12 Democratic Fusionists in the House. The State representation in Congress will be found in the article UNITED STATES, under the section *Congress*.

IDO. See INTERNATIONAL LANGUAGE.

IGNATIEFF, NIKOLAI PAVLOVITCH. A Russian diplomatist, died on July 4, 1908. He was born on January 29, 1832, in St. Petersburg; entered the diplomatic service in early life and had a long and distinguished career. He was commissioner to the Khan of Khiva in 1858, and from 1859 to 1864 ambassador to China, where he succeeded in negotiating the treaty fixing the present boundary between the two empires. He was ambassador to Turkey from 1864 to 1877, and had charge of the negotiations preceding the war of 1877-78 between Russia and Turkey, and in the negotiations which ended it by the Treaty of San Stefano. He was Minister of the Interior in 1881-82.

ILLINOIS. One of the North Central Division of the United States. Its total area is 58,339 square miles. According to Federal estimate, the population in 1908 was 5,617,709. The capital is Springfield.

MINERAL PRODUCTION. The rapidity with which the Illinois oil field developed was the most surprising feature of the world's petroleum industry in 1907. In 1905 the product amounted to only 181,084 barrels; in 1906 this increased to 4,307,050 barrels, and in 1907 it had increased nearly five-fold, or to 24,281,973 barrels. Petroleum is found in limestone as well as in sandstone lenses embedded in shales and the oils vary correspondingly in the percentage of sulphur which they contain. The value of the output in 1907 was \$16,432,947, as against \$3,274,818 in 1906, and \$116,561 in 1905. Illinois rose from the rank of ninth State in the production of petroleum in 1906 to the third State in 1907, being in that year surpassed only by the Oklahoma-Kansas field and by Pennsylvania. The total production of coal in Illinois in 1907 was 51,317,146 short tons, with a spot value of \$54,687,382. This was an increase of 9,837,042 short tons in quantity and of \$9,924,320 in value over the production of 1906, and again advanced Illinois to second place among the coal-producing States, a position it had held uninterruptedly since 1883,

when Illinois supplanted Ohio as second in rank among the coal-producing States, and up to 1906, when Illinois was supplanted by West Virginia. The increase in production in 1907 was due in large measure to a heavy demand for coal and also to the renewed activity in mining after the recovery from the effects of the suspension on April 1, 1906. During the suspension, practically all the important mines of the State were idle, and 49,792 men out of a total of 61,988 in the State were idle for an average of 58 days. Illinois contains more coal-producing counties than any other State in the Union. There were in 1907 52 counties which produced 1,000 tons or more. The number of men employed in the coal mines of the State in 1907 was 65,581. There were employed in the production of the coal 1,080 machines. The machine-mining product showed an increase of 3,548,982 short tons over that of 1906. In 1907 there were 172 men killed in the coal mines of the State. The quantity of coke produced in 1907 was 372,697 tons as against 268,693 tons in 1906. Illinois ranks tenth among the States in the production of coke, having risen from 23rd place in 1903 and 14th place in 1906. There were 309 coke ovens in the State in 1907, with 280 building. The value of the coke produced was \$1,737,464. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$145,768,464, as compared with a value of \$121,188,306 in 1906.

Statistics for the fiscal year ending June 30, 1908, compiled by the secretary of the Bureau of Labor Statistics, showed that the coal production of the State during the fiscal year amounted to 49,272,452 short tons, as compared with 47,798,621 short tons during the fiscal year 1907, and with 51,317,146 short tons for the calendar year 1907. It is not believed that the tonnage for the calendar year 1908 will show any material increase or decrease. The only notable labor trouble during the year was a shut-down which occurred in April and May, when the operators and the miners were attempting to reach an agreement.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 298,620,000 bushels, valued at \$170,213,000, from 9,450,000 acres; winter wheat, 30,212,000 bushels, valued at \$29,306,000, from 2,324,000 acres; oats, 94,300,000 bushels, valued at \$44,321,000, from 4,100,000 acres; barley, 855,000 bushels, valued at \$556,000, from 30,000 acres; rye, 1,214,000 bushels, valued at \$886,000, from 71,000 acres; buckwheat, 91,000 bushels, valued at \$82,000, from 5,000 acres; potatoes, 11,076,000 bushels, valued at \$9,193,000, from 156,000 acres; hay, 4,743,000 tons, valued at \$38,893,000, from 3,100,000 acres; tobacco, 1,132,500 pounds, valued at \$96,262, from 1,500 acres. In both acreage and production of corn, the State holds first rank. The wheat crop has showed a steady and rapid increase since 1902, although the production in 1908 showed a considerable falling off from 1907, which was 40,104,000 bushels. The potato crop also showed a decrease from the crop of 1907, which was 13,398,000 bushels. The production of hay, however, was materially increased over the crop of

1907, which was 3,730,000 tons. The tobacco crop also showed a substantial increase, the figures for 1907 being 880,000 tons. The number of farm animals in January, 1909, was as follows: Horses, 1,623,000; mules, 92,000; dairy cows, 1,220,000; other cattle, 2,056,000; sheep, 793,000; swine, 4,438,000. The State ranks first in the number of horses, second in the number of swine, and fourth in the number of dairy cows. The estimated value of the wool clip in 1908 was \$887,250.

MANUFACTURES. Illinois ranks third among the manufacturing States, being surpassed by New York and Pennsylvania. The progress in manufactures in recent years has been very great. The special census of 1905 included only industries carried on in factories, but a comparison with the census of 1900 on the same basis shows an increase of 33 per cent. in the amount of capital invested, 14 per cent. in the average number of wage-earners, and 25.8 per cent. in the value of products. The figures for 1905 were: Capital, \$975,844,700; wage-earners, 379,436; value of products, \$1,410,342,000. Of the wage-earners, 60,399 were women at least 16 years of age, and only 4,946 were children under 16.

EDUCATION. The school population of the State, according to the last biennial report of the State Superintendent, was 1,500,066 (ages 6 to 21). The total enrollment in the public schools in 1907-8 was 988,078, and the average daily attendance, 760,477. There were 429 graded schools and 613 ungraded schools. The former had an enrollment of 696,010, and the latter of 292,068. The total enrollment in the 479 high schools of the State was 56,576; public school teachers numbered 23,115 women and 5,411 men. The high school teachers numbered 2,305. The total expenditure for public schools in 1907-8 was \$32,227,605.06. The enrollment in the 943 private schools was 165,520, and the teachers employed were 4,919. The enrollment of the five State normal schools was 4,988. The last General Assembly authorized the appointment of an Education Commission to simplify and recodify the present school system, and after making a thorough study of other school systems to make such recommendations concerning new school legislation to the Forty-sixth General Assembly as the Commission deemed necessary.

FINANCE. The report of the State Treasurer for the biennium, Oct. 1, 1906, to Sept. 30, 1908, inclusive, shows that the total amount received during that period was \$14,697,077.73, while the total disbursements were \$16,332,679.71. There was a balance in the treasury Oct. 1, 1906, of \$4,990,041.32, leaving a balance in the treasury Oct. 1, 1908, of \$3,354,439.34. The principal of the bonded debt of the State in October, 1908, was \$17,500. The principal sources of revenue were taxes and the amounts received from county treasurers. The chief disbursements were for the State school fund, for the State game protection fund, and the State food commissioners' fund.

CHARITIES AND CORRECTIONS. There are seventeen State charitable institutions, two prisons, one at Joliet and one at Chester, and one reform school at Pontiac. The charitable institutions comprise six general hospitals for the insane, at Elgin, Kankakee, Bartonville, Watertown, Jacksonville, and Anna; one hospital for criminal insane at Menard, one school for feeble-

minded children at Lincoln, one school for delinquent boys at Geneva, one school for delinquent boys at St. Charles, one soldiers' and sailors' home at Quincy, one soldiers' orphans' home at Normal, one soldiers' widows' home at Wilmington, two institutions for the blind, one a school at Jacksonville, and the other an industrial home at Chicago, one charitable eye and ear infirmary at Chicago, and one school for the deaf at Jacksonville. The total inmate population of all these institutions is 17,921. The largest grouping is the insane, which has 9,985 patients, or 56 per cent. of the total State wards. Under a new law the insane in county almshouses are being removed to State institutions, but the figure 9,985 does not include the insane still in almshouses, who number about 2,100, most of them at the Cook County institution at Chicago. There are 100 almshouses in the State. The State institutions are managed by local boards of trustees appointed by the Governor.

POLITICS AND GOVERNMENT. After unsuccessful attempts made in 1907, the State Legislature passed in January, 1908, a direct primary election law, which was signed by Gov. Deneen on Feb. 29, and went into effect on July 1. (See **PRIMARY, DIRECT.**) For the result of the first elections held under this law in August, see paragraph *Conventions and Elections* below. The State Supreme Court in April handed down a decision declaring valid the local option law of the State. The liquor interests maintained that the law was in conflict with the local self-government of towns and cities or villages. The point at issue hinged upon the question of municipal or township supremacy. Coulterville, a village of Randolph county, decided for saloons at the recent election. The county, however, voted to be dry, and, according to the ruling of the Supreme Court, the county or township is the unit to be recognized by law. As a result of this ruling, 1,500 saloons in the State were forced to go out of business. For the results in the elections held under the local option law on April 7, see paragraph *Conventions and Elections* below. The Supreme Court of the United States, on March 16, sustained the convictions of the Armour, Swift, Morris and Cudahy packing companies for accepting rebates on packing house products, and of the Burlington Railroad Company for granting them. The ruling upheld the validity of the Elkins anti-rebate law. On Feb. 20, the Illinois Supreme Court declared that a labor union's "unfair list" was, in effect, a boycott and therefore illegal. The Court also declared "picketing" unlawful.

CHICAGO. In the early months of the year there was started a vigorous movement to enforce the laws providing for the closing of the saloons on Sunday. This law had been obsolete for thirty-five years. Mayor Busse refused to employ the police for this purpose, and prosecutions against offenders of the law were brought by the State's Attorney. The juries in all of a large number of cases could not agree. A test case was carried to the Supreme Court of Illinois, which had not rendered a decision in the matter up to the end of the year. An attempt by the advocates of the open saloon to have placed on the ballots at the municipal elections of April the question of whether saloons should be open or not, under the Public Policy Question Act, was defeated by a ruling of the State Su-

preme Court. The vote sought would have been only a declaration of public opinion and not binding on the public authorities for action. The results of the municipal election in Chicago will be found in the paragraph *Conventions and Elections* below.

On Jan. 18, John R. Walsh was convicted of misapplying the funds of national banks, and on March 16 he was sentenced to five years' imprisonment in the Federal prison at Leavenworth, Kansas. Enforcement of the Walsh sentence, however, was stayed by a supersedeas, issued by Judge P. S. Grosscup, permitting Walsh's attorneys to take the case before the United States Court of Appeals. A final decision in the case had not been made at the close of the year. On March 2, Lazarus Averbuch, a Russian Jew and an avowed anarchist, attempted to kill George M. Shippy, the Chief of Police. The would-be assassin was shot dead by Shippy after he had wounded the latter's son and coachman by stabbing them with a knife. An account of the meeting of the Republican and Socialist National Conventions in Chicago will be found in the article *PRESIDENTIAL CAMPAIGN*. Work was begun, towards the close of the year, on a new city hall, which, it is expected, will be completed by Dec. 1, 1910. On Jan. 28, fire destroyed several business buildings and caused a loss of over \$1,000,000, and on Aug. 3, property including grain elevators, freight sheds, cars and buildings was destroyed, causing a loss of \$1,500,000. Much progress was made during the year on the reconstruction of the street railways of the city under the traction-settlement ordinance, whereby the city receives 55 per cent. and the companies 45 per cent. of the net profits from operation of street cars.

CONVENTIONS AND ELECTIONS. Elections under the local option law were held in the townships of the State on April 7. Of the 1,295 townships voting, 1,053 were carried by the no-license vote in 84 counties, while the license vote was successful in 242 townships. As a result of this vote 35 of the 102 counties of the State were wholly without saloons after Dec. 7, and 64 were partly "dry." Among the cities carried by the no-license forces were Decatur, Rockford and Mattoon. Most of the large cities voting were carried for license. There was no vote on the saloon question in Chicago, Quincy, Peoria, and several other cities. The result of the election in Chicago, which was for local officials, was a substantial Republican victory. Twenty-three Republican aldermen were elected, as compared with 11 Democratic and 1 Independent Republican. The result insured a Republican majority of 17 in the City Council. In the second election held on April 21, the license forces were generally successful in the 60 or more towns voting. About 70 saloons were, however, voted out of existence. As a result of three local option elections 36 counties were made "dry." Primary elections for the nomination of candidates for Governor and for the United States Senate were held throughout the State on Aug. 8. The Republican candidates for Governor were Governor Charles S. Deneen, and Richard Yates, a former Governor. The Democratic candidates were Adlai E. Stevenson, Vice-President of the United States during the second Cleveland administration, and James Hamilton Lewis. Deneen was renominated over Yates by about 15,000 votes, and Stevenson

was nominated over Lewis by about 17,000 votes. Of the candidates for the Senate, Albert J. Hopkins, the outgoing Senator, received the largest number of votes, but had no plurality, and the contest will be decided by the State Legislature. His nearest competitor was George Edmund Foss. The working of the new primary law in general gave satisfaction.

The Republican State Convention for the selection of delegates to the National Convention met at Springfield on March 26. Resolutions were passed indorsing President Roosevelt's administration, and the recent legislation against trusts, combinations and monopolies. Revision of the tariff was urged in a strong resolution. The delegates chosen were instructed to vote for Joseph G. Cannon for President. The Democratic State Convention met at Springfield on April 23. Resolutions were adopted censuring the Republican State administration for extravagance, and denouncing "the usurpation of power by the President of the United States." The delegates chosen were instructed to vote for William J. Bryan for President.

As a result of factional disputes and issues local to the State, Illinois was generally regarded as one of the possibly "doubtful" States in the Presidential election, although its voting strength is normally predominantly Republican on national issues. The results were, therefore, looked forward to with great anxiety by the leaders of both parties. The vote contained surprises for both sides, for while Taft was given a plurality over Bryan of 179,122 votes (629,932—450,810) the Republican candidate for Governor, Deneen, was chosen over Stevenson by a plurality of only 23,164 votes (550,076—526,912). A recount of the votes was claimed by the Democrats on the plea that they elected Stevenson. This was one of the most remarkable examples of independent voting ever seen in this country. The voters of the State authorized an amendment to the law governing the State Canal Board, and an issue of \$20,000,000 bonds for a deep waterway along the Desplaines and Illinois rivers to connect Lake Michigan with the Mississippi river. Amendments to the general banking law were also adopted.

OTHER STATE EVENTS. An outbreak of remarkable violence began in Springfield on August 14, as the result of an alleged attack by a negro upon a white woman. An attempt was made to lynch the negro, but this was prevented by the police, who outwitted the mob and took the prisoner to Peoria. Infuriated at this action, the mob lynched another negro, and then made an unrestrained attack upon the "bad lands," the negro quarters of Springfield. Many houses were burned and the mob attacked every negro who appeared, hanging a second negro, an inoffensive old man. In addition to the two men killed and nearly 100 wounded, the Assistant County Treasurer, W. K. Bowe, was fatally shot by negroes and robbed of a considerable sum of money. The local authorities were unable to cope with the mob, and the militia were hurried to the city by the orders of Governor Deneen. It was necessary for the militia to fire several volleys at the rioters before order was restored. Nearly all the negroes in the city fled to other places on August 16th. On August 17th, Governor Deneen offered rewards of \$200 each for the arrest of the murderers of six men who were killed in the riots.

Mrs. Kate Howard, one of the leaders of the mob, killed herself by drinking poison when arrested on August 26th. A grand jury was convened immediately to investigate. Seventeen indictments were returned August 17th by this jury for complicity in the riots. Four policemen, members of the Springfield police force, were indicted, and the grand jury censured the department for cowardice and recommended its renovation. The total number of indictments returned by the grand jury was 100. The negro whose attempted lynching started the affair was proved to be innocent of the charge made against him.

The semi-centennial anniversary of the debate between Abraham Lincoln and Stephen A. Douglas on the slavery question was celebrated in Galesburg on October 7th. William H. Taft, Adlai E. Stevenson and Congressman Theodore E. Burton were among those who made addresses. A tablet was unveiled to mark the site where the debate took place. Similar celebrations were held at Alton, Ottawa, Quincy, Freeport, Jonesboro and Charleston, where Lincoln and Douglas debated.

LEGISLATION. With the exception of the primary election law noted above, and which is described in the article **DIRECT PRIMARIES**, there was little notable legislation passed at the session of 1908. A resolution was passed for a Forest Preserve District Commission to investigate and report in regard to the creation of forest preserve districts, and to recommend legislation in regard to it.

STATE OFFICERS. Governor, Chas. S. Deneen; Lieutenant-Governor, L. Y. Sherman; Secretary of State, James A. Rose; Treasurer, Andrew Russell; Auditor, J. S. McCullough; Attorney-General, W. H. Stead; Adjutant-General, to be named; Superintendent of Insurance, to be named; Superintendent of Public Instruction, Francis G. Blair—all Republicans.

JUDICIARY—Supreme Court: Chief Justice Jas. H. Cartwright, Rep.; Associate Justices, Wm. M. Farmer, Dem.; John P. Hand, Rep.; Frank K. Dunn, Rep.; Guy C. Scott, Dem.; Alonzo K. Vickers, Rep.; Orrin N. Carter, Rep.; Clerk of the Court, C. Mamer, Rep.

The State Legislature of 1908 was composed of 38 Republicans and 13 Democrats in the Senate, and 89 Republicans and 64 Democrats in the House. The State representation in Congress will be found in the article **UNITED STATES**, under the section *Congress*.

ILLINOIS, UNIVERSITY OF. An institution of higher learning at Urbana and Champaign, Ill., founded in 1868. The attendance in the autumn of 1908 was 4,800. Of the 4,753 students in 1907-8, the undergraduate college registered 2,837; College of Medicine, 476; Pharmacy, 259; Law, 186; Dentistry, 76; Summer School (1908) 656; Academy, 377; Graduate School, 203. The requirements for admission to the three years' course in medicine have been fixed at three years of college work; to the four years' course, one year of college work. The financial condition of the University on June 30, 1908, indicated an income of \$1,408,762.51 for the preceding year. Of this \$1,006,945 came from the State; \$53,864.38 from the United States government; \$119,348.04 from fees; \$31,943.39 from interest on the endowment. Of this sum, \$298,650.50 was paid for instruction in all subjects except agriculture, medicine, and pharmacy; \$194,436 was expended on

equipment. The endowment of the University in 1908 was \$641,477.53. There are 115,000 volumes in the library. The President is Dr. Edmund J. James.

IMMIGRATION AND EMIGRATION.

Owing to the industrial depression following the financial crisis of October, 1907, there was a very decided check to the remarkable influx of immigrants into the United States, which had continued in an ever increasing stream for a decade. The break in American prosperity and the increase in unemployment did not become known soon enough to show any effect in the tide of immigrants until December, 1907, but by January the full effect of the changed economic conditions was apparent in the movement of aliens. This effect appeared not only in a decided fall in the number of immigrants but also in a remarkable exodus of resident aliens to European lands. The number of immigrant aliens by months for the fiscal year 1908 were as follows: July, 97,132; August, 98,825; September, 98,694; October, 111,513; November, 117,476; December, 66,574; January, 27,220; February, 23,381; March, 32,517; April, 41,274; May, 36,317; June, 31,947. The total was 782,870 or 502,479 fewer than for the fiscal year 1907. This total was smaller than for any year after and including 1903, but larger than for any preceding year except 1882. These figures include only those classed as immigrant aliens, that is, those who intend to reside here permanently. In addition there were 141,825 aliens arriving during the fiscal year who were classed as non-immigrant, that is, they were either alien residents of the United States returning from a trip abroad, or foreigners residing abroad but making a temporary trip to this country. The total number of aliens admitted during the fiscal year was therefore 924,695. Of these 72.8 per cent. arrived during the last six months of 1907 and only 27.2 per cent. during the first six months of 1908. The months following June, 1908, showed very slight, if any, increase in the number of immigrant aliens. The numbers were as follows: July, 27,570; August, 27,782; September, 38,238; October, 40,994; November, 37,076, and December, 46,003. As a bit of striking evidence of the decline in immigration in 1908 as compared with 1907, one may compare the figures for the various quarters of the calendar years. For the first quarter the number of immigrant aliens in 1907 and 1908 were respectively 259,076 and 82,018; for the second quarter 484,876 and 109,538; third quarter, 294,651 and 93,590; and fourth quarter, 295,563 and 124,073. The total for the calendar year 1907 was 1,334,166 and for 1908, 410,219.

Of the immigrant aliens admitted during the fiscal year 1908 (that is, 782,870), 506,912 were males and 275,958 were females. Classified by age, there were 630,671 or fully 80 per cent. between the ages of 14 and 44; 112,148 or more than 14 per cent. were under 14 years of age. Of those 14 years of age or over 172,293, or 26 per cent., could neither read nor write, while 2310 could read but could not write. These newcomers showed to immigration officials a total of \$17,794,226, an average of \$23 each. This was believed to be less than one-half the amount of money actually brought in. The greatest quantity of money was shown by Italians, Germans, English and Hebrews.

There were debarred during the year 10,902, as compared with 13,064 in 1907. Of those rejected 2608 were debarred on account of trachoma, 4571 as likely to become public charges, 1932 as contract laborers, 370 for mental defects, and 311 for moral reasons. There were also 2069 aliens already in the country who were deported for illegal residence. Of the immigrants 75 per cent. entered at the port of New York, 7.5 per cent. through Canada, 5.3 per cent. through Boston, 4 per cent. through Philadelphia, and 2.2 per cent. through Baltimore. The following table from the Report of the Commissioner-General of Immigration shows the immigrants classified by country of last permanent residence and the increase or decrease as compared with 1907:

	1908	Increase (+) or decrease (-)
Austria-Hungary	168,509	-169,943
Belgium	4,162	- 2,234
Bulgaria, Servia, and Montenegro	10,827	- 532
Denmark	4,954	- 2,289
France, including Corsica	8,788	- 943
German Empire	32,309	- 5,498
Greece	21,489	-15,061
Italy, Sicily, and Sardinia	128,503	-157,228
Netherlands	5,946	- 691
Norway	12,412	- 9,721
Portugal	7,307	- 2,301
Roumania	5,228	+ 844
Russian Empire and Finland	156,711	-102,232
Spain	3,899	- 1,885
Sweden	12,809	- 7,780
Switzerland	3,281	- 467
Turkey in Europe	11,290	- 9,477
United Kingdom:		
England	47,031	- 9,606
Ireland	30,556	- 3,974
Scotland	13,506	- 6,234
Wales	2,287	- 373
Other Europe	97	- 10
Total Europe	691,901	-507,665
China	1,397	+ 436
Japan	15,803	-14,423
India	1,040	+ 142
Turkey in Asia	9,753	+ 1,700
Other Asia	372	- 14
Total Asia	28,365	- 12,159
Africa	1,411	- 75
Australia, Tasmania, and New Zealand	1,098	- 849
Pacific islands, not specified	81	+ 39
British North America	38,510	+18,592
British Honduras	42	+ 7
Other Central America	1,175	+ 240
Mexico	6,067	+ 4,661
South America	2,315	- 464
West Indies	11,888	- 4,801
Other countries	17	- 5
Grand total	782,870	-502,479

This table indicates that in the fiscal year 1908 21.6 per cent. of the immigrant aliens came from Austria-Hungary, 20 per cent. from Russia, 16.4 from Italy and 12 per cent. from the United Kingdom. While the total immigration was 39 per cent. less than in 1907, that from Austria-Hungary was approximately 50 per cent., that from Italy 55 per cent., and that from Russia 39 per cent. less than in the year

1907. That from Greece and Turkey also declined very decidedly. A classification of the immigrants by destination showed that 32.8 per cent. of them were bound for New York, 14.3 per cent. for Pennsylvania, about 7.3 per cent. to Illinois and to Massachusetts, and 4.0 per cent. to New Jersey and to Ohio. While with most of the immigrants country of last permanent residence indicates also the race or people, this is not always the case. Thus in 1908 there were 103,387 Hebrews, 68,105 Poles, 6746 Finns, 13,720 Lithuanians, 24,378 Magyars and 10,164 Bohemians and Czechs. The occupations of the majority of the immigrants is shown as follows: farm laborers, 138,844; laborers, 146,051; servants, 89,942; skilled laborers and artisans, 123,640; professional persons, 11,078. In the case of 242,677, mostly women and children, no occupation was specified. Of the skilled workmen, 20,735 were tailors, 11,394 carpenters and joiners, 10,739 clerks and accountants, 7337 miners, 7600 shoemakers, and 5273 dressmakers. Teachers, clergy, engineers, actors and musicians made up the bulk of those classed as professional men.

The figures for immigration do not by any means indicate the net addition to population by this cause. The new immigration law in effect July 1, 1907, requires the registration of departing aliens. These are divided into two classes, namely, emigrant aliens, or those who have resided in the United States but intend to take up residence abroad, and non-emigrant aliens, including both those who were classed as non-immigrant aliens on arrival and those who were classed as immigrant aliens on arrival but have, after brief residence here, decided to locate permanently abroad. During the fiscal year 1908 the emigrant aliens numbered 395,073 and the non-emigrant aliens, 319,755, a total of 714,828. Subtracting this number from the total number of aliens admitted leaves a net immigration of 209,867, or 27 per cent. of those admitted. This low percentage of net immigration for 1908 compares with an estimated percentage of net immigration for 1907 of 78 per cent., for 1906 of 74 per cent. and of 68 per cent. for the decade 1899-1908. Moreover it should be noted that the surplus of immigration over emigration for the fiscal year 1908 was entirely due to the great tide of immigration of the first five months of the year. An excess of immigrants over emigrants during the months preceding December of 300,328 was replaced during the last seven months by an excess of emigrants of 90,461. The numbers of emigrants by months during the fiscal year were as follows: July, 46,198; August, 44,317; September, 43,734; October, 55,826; November, 94,440; December, 88,432; January, 60,233; February, 50,688; March, 43,506; April, 65,721; May, 61,251; June, 60,482. For the first months of the fiscal year 1908-9 the numbers were: July, 49,473; August, 45,713; September, 42,049, and October, 39,851. In the year ending October 31, 1908, the total inward alien movement was 655,263, and the total outward movement 701,839, giving a net emigration of 46,576. Beginning with December, 1907, the emigration exceeded the immigration every month until September, 1908, except March, when it was very slightly less. Beginning with September the immigration once more exceeded the emigration.

This very unusual departure of aliens was due primarily to the industrial depression, but was also connected with the uncertainty attending a presidential campaign. Besides those leaving for these reasons were the several hundred thousand who in recent years have annually departed for other reasons. Many return for the winter season or for festival occasions, while others, having acquired a competence, return to their native lands to spend their remaining years. In his 1908 report the Secretary of Commerce and Labor argued that this outward movement of aliens is of great value for the development of America's foreign trade, since those returning to their native lands take with them demand for American manufactures. Moreover they assist in the growth of better understanding between nations. The great influx of immigration, the Secretary stated, had transplanted new industries to the United States and had assisted materially in the development of those already here. The foreign laborer has performed the more menial tasks of a period of remarkable industrial development, permitting the native workmen to perform more remunerative labor. Moreover in spite of unprecedented immigration wages have not fallen but have steadily risen.

Asiatic immigration was 30 per cent. less in 1908 than in 1907. While that from China and India increased slightly and that from Turkey increased 21 per cent., that from Japan fell from 30,226 in 1907 to 15,603 in 1908. The total Japanese immigration, however, was 18,238, of whom slightly more than half were admitted to the mainland and the remainder to Hawaii. Of the 9544 admitted to the mainland only 3860 were classed as laborers. All of these laborers under the provisions of the new law were former residents, parents, wives or children of residents, or farmers already interested in a farming enterprise in this country. During the year 5718 Japanese departed from continental United States, of whom 2523 were laborers. The voluntary agreement by Japan to refuse passports to those of her citizens not desired as immigrants was effective in greatly reducing Japanese immigration. This agreement was made in December, 1907. Two-thirds of the Japanese immigrants to continental United States during the fiscal year 1908 came in before January 1. The Chinese emigrants numbered 3898, being about three times as numerous as the registered Chinese immigrants. There was more or less illegal entrance of both Japanese and Chinese.

The Immigration Commission of three Senators, three Representatives, and three experts appointed by the President as provided by the law of 1907, continued its study of immigration problems at home and abroad during the year, but had not submitted its report to Congress at the close of the year. The Commission made a most careful first-hand study of conditions in Greece, Italy and Austria-Hungary, with a view to ascertaining the desirability of immigration from those countries.

During the year steps were taken toward the improvement of practically all the immigrant stations. This was true at New Orleans, Galveston, Charleston, San Francisco, Philadelphia, and New York. The improvements at Ellis Island in New York harbor were such as to pro-

vide the most healthful and sanitary conditions that modern science can devise.

New legislation consisted of the Lodge bill, passed in December, 1908, which requires at least fourteen square feet for the berthing accommodations of each steerage passenger, except on the lowest passenger deck where the requirement is eighteen square feet. Moreover there must be provided at least three square feet additional for each passenger as smoking and recreation rooms; and at least five square feet for each steerage passenger on the open deck. Not only will this bill insure better hygienic conditions of travel for steerage passengers, but it may serve to check immigration at times of unusual influx. Thus taking twenty-five average steamships, which under the law of 1882 could transport 45,616 steerage passengers, it is found that under the new law they can transport only 32,503, a reduction of almost 30 per cent.

The New York Legislature in 1908 provided for a commission to investigate the condition of resident aliens and the general subject of immigration in so far as it is a matter of State concern. In view of the fact that about one-third of the immigrant aliens find their home and labor in New York State, the Immigration Commission is expected to bring to light many interesting facts. It will study the treatment of the immigrant on his arrival by employment, information and relief bureaus, lodging houses and transportation companies.

The effect of the emigration upon Italy received considerable attention during the year. It was shown that in some sections, especially in Southern Italy, whole villages had been practically wiped out by movement to America. The result was a tendency toward degeneration in the population, and a disruption of economic activities. Furthermore such wholesale emigration has a tendency to cut off the large amounts of money sent from America to relatives. A pressing question in New York City was the large proportion of criminality among Italian immigrants, and means of reducing this undesirable class of arrivals by cooperation with the Italian police were under consideration during the year.

INCANDESCENT LAMPS. See **ELECTRIC LIGHTING.**

INDIA, BRITISH. The total area and population (1901) of British India are 1,773,168 square miles and 294,361,056, of which British Territory comprises 1,097,901 square miles, with 232,072,832 inhabitants, and Native States and Agencies 675,267 square miles, with 62,288,224 inhabitants. Of the total population in 1901, 149,951,824 were males and 144,409,232 females. The urban population numbered 29,361,056, and the rural, 265,116,836. According to religion, the population was divided as follows: Hindus, 207,050,557; Sikhs, 2,195,339; Jains, 1,334,148; Buddhists, 9,476,759; Parsis, 94,190; Mohammedans, 62,458,077; Christians, 2,923,241; Jews, 18,228; Animists, 8,584,148; others, 129,900. The principal cities, with their populations in 1901, are: Calcutta, 847,796, with suburbs, 1,106,738; Bombay, 776,006 (1905, 977,822); Madras, 509,346; Hyderabad, 448,466; Lucknow, 264,049; Rangoon, 234,881; Benares, 209,331; Delhi, 208,575; Lahore, 202,964; Cawnpore, 197,170; Agra, 188,022; Ahmedabad, 185,-

889; Mandalay, 183,816; Allahabad, 172,032; Amritsar, 162,429; Jaipur, 160,167; Bangalore, 159,046; Howrah, 157,594; Poona, 153,320; Patna, 134,785; Bareilly, 131,208; Nagpur, 127,734; Srinagar, 122,618; Surat, 119,306; Meerut, 118,129; Karachi, 116,663; Madura, 105,984; Trichinopoly, 104,721; Baroda, 103,790.

The number of coolie emigrants embarked in 1907 from Indian ports to various British colonies under the laws regulating emigration was 21,003. In 1906 births and deaths were registered for a population of 223,208,181. The number of births was 8,438,123 (4,359,339 male and 4,078,784 female), and of deaths, 7,775,837 (4,014,331 male and 3,761,506 female). The ratio per 1000 of population was: For births, 37.80; for deaths, 34.83. The plague mortality in 1907 was 1,204,194; during the period 1896-1907, 5,921,160 (4,931,474 in British Territory and 989,686 in Native States).

EDUCATION. In 1901 the number of those able to read and write was 15,686,421 (1,125,231 in English), of whom 996,341 were females. The following table presents a summary of the educational institution in British Territory during the year 1906-7:

	Institutions		Scholars	
	For Males	For Females	Males	Females
Public Institutions—				
Art colleges.....	129	8	19,099	160
Professional colleges	43	3	6,137	113
Secondary schools.....	5,347	567	654,392	61,358
Primary schools....	102,992	9,992	3,444,811	495,895
Teachers' training schools	315	63	7,785	1,407
All other special schools	1,890	58	55,857	3,067
Total public institutions	110,716	10,691	4,188,061	562,000
Private Institutions—				
Advanced	3,700	11	60,310	1,173
Elementary	35,804	1,768	526,981	59,317
Total private institutions	39,504	1,779	587,291	60,490
Grand total.....	150,220	12,470	4,775,372	622,490

The total expenditure on education in British Territory in the year 1906-7, including provincial, local, and municipal expenditures, fees, subscriptions, endowments, etc., was £3,734,207. In 1906-7 there were published 744 newspapers, 973 periodicals, 1589 books in English or other European languages, and 8126 in Indian languages. The number of printing presses was 2400.

AGRICULTURE. According to the survey, the net area of British Territory, minus the area of feudatory and tributary states and the area for which no returns exist, was 583,744,368 acres in 1906-7. Of this total, 81,752,193 acres were under forest; 137,164,721 not available for cultivation; 106,698,446 cultivable waste other than fallow; and 39,933,488 fallow. The area sown with crops was 214,026,319 acres, of which 36,654,558 were irrigated. Food-grains covered 195,117,838 acres, of which rice took up 73,541,128; wheat, 25,137,982; barley, 7,700,110; jawar, 20,781,722; bajra, 15,033,742; ragi, 3,567,712; maize, 6,171,751; gram, 13,203,149; other grains and pulse, 29,890,542. Gardens, orchards, spices, etc., covered 7,274,340 acres; sugar, 2,623,874; coffee, 96,050; tea, 505,147; lin-

seed, 2,514,861; sesamum, 3,908,376; rape and mustard, 4,231,479; other oilseeds, 2,842,770 (total oilseeds, 13,965,315); cotton, 13,771,214; jute, 3,523,558; other fibres, 692,495; indigo, 448,594; opium, 614,915; tobacco, 1,009,210; fodder crops, 4,547,733.

The estimated yield in 1906-7, including the crops in certain of the Native States, was: Cleaned rice, 430,258,400 cwts.; wheat, 8,447,840 tons; coffee, 17,695,312 lbs.; tea, 240,849,894 lbs.; cotton, 4,908,000 bales; jute, 8,736,200 bales (400 lbs. each); linseed, 19,900 tons; rape and mustard, 1,060,900 tons; sesamum, 531,100 tons; cane sugar, 2,223,400 tons.

TEA. The bulk of Indian tea is grown in Assam (343,507 acres in 1907), Eastern Bengal (55,194 acres), Bengal (52,983 acres), and Burma (1669 acres). Included in the 1907 production were 3,546,500 pounds of green tea, of which 1,293,875 were produced in the Surma valley. Since 1885 the area under tea in India increased 91 per cent., and the production 246 per cent. The quantity of Indian tea exported during the year ending March 31, 1908, was 228,187,826 pounds, of which the United Kingdom took 169,474,706 pounds; Russia, 15,407,027; Australia and New Zealand, 11,090,431; Ceylon, 8,880,884; China and Hongkong, 7,502,342; Turkey, 3,851,775; the United States, 2,806,408; Canada, 4,731,513.

COTTON AND JUTE. The total area under cotton in India was 19,732,000 acres in 1906-7; 20,826,000 in 1907-8; and was estimated at 18,670,000 in 1908-9. The principal centres of cotton production were in 1907-8 as follows: Bombay (including Native States) and Baroda, 5,276,000 acres; Central Provinces and Berar, 4,429,000; Punjab (including Native States) 1,155,000; United Provinces, 1,100,000; Ajmer-Merwara, 2,971,000; Central India, 1,002,000; Madras, 684,000. The total yield in 1906-7 was 4,945,700 bales (400 lbs. each); for 1907-8 it was estimated at 3,049,000, and for 1908-9 at 3,641,000 bales. The export of cotton during the year ending September 30, 1907, was 2,717,000 bales; the mill consumption was 1,895,000 bales; and the local consumption was estimated at 750,000 bales, this estimate being based on the assumption that one pound of cotton per capita is absorbed by the 300,000,000 inhabitants.

SUGAR. Notwithstanding a home production of 2,223,400 tons of cane-sugar, there were imported, in 1906-7, 11,104,003 cwts. of sugar, of which 3,800,000 were beet sugar, mainly from Austria-Hungary, Germany, Great Britain, etc.

IRRIGATION. The principal results of the operations of the government irrigation works for the fiscal year 1906-7 are shown below:

	Major Works	Minor Works
Main canal, miles	9,485	5,340
Distributaries, miles	27,350	2,242
Area of land irrigated during the year, acres	13,551,159	2,248,399
Total capital outlay to end of year	£ 29,079,585	£ 4,250,079
Gross receipts	£ 3,383,827	£ 377,899
Working expenses	£ 1,038,883	£ 153,269
Net revenue (excluding charge for interest)....	£ 2,344,944	£ 224,630
Percentage of above revenue on total capital outlay	8.06	5.28
Interest on direct capital outlay	£ 935,231	£ 138,057

In 1908 it was reported that the government proposed to link the five rivers of the Punjab—the Indus, Jelum, Chenab, Beas, Ravi and Sutlej—in such a manner as to equalize the flow of water when one river or more is in flood and thus supply the whole canal system connected with these rivers.

MINING. The total value of the mineral production in 1907 was £7,071,868, against £6,312,821 in 1906. The following table shows the production and value of the principal minerals in British Territory and Native States in 1907:

	Quantity	Value
Gold, ounces	556,488	£2,133,691
Coal, tons	11,147,339	2,609,726
Petroleum, gallons	152,045,677	610,015
Salt, tons	1,102,594	397,770
Manganese ore, tons	898,345	589,830
Saltpetre, cwts. *	357,589	274,679
Mica, cwts. *	38,922	228,161
Jadestone, cwts. *	4,897	74,509
Ruby, sapphire, and spinel, carats	640,217	98,258

*Exports.

The bulk of the coal comes from Bengal—9,993,348 tons in 1907. Salt is supplied mainly by Northern India, Bombay, and Madras. About half the total production is supplied by private manufactures, and the other half by the government. Manganese ore, of which India is one of the world's largest producers, comes mainly from the Central Provinces (496,000 tons in 1907), Madras (108,966) and Central India. Despite the occurrence of iron ore of a superior quality attempts to erect smelting plants have proved failures, except at Barakar on the Raniganj coal field, where there are blast furnaces with an annual output of 50,000 tons of pig iron. To the gold production of 1907 Mysore alone contributed about 531,850 ounces, valued at £2,022,367. In 1908 the Kolar district in Mysore, including the Hutti mine in the Deccan, reported an output of 560,343 ounces of bullion equivalent to 504,309 ounces of fine gold, as compared with 549,731 ounces of bullion in 1907. Petroleum is furnished almost entirely by Burma (148,888,002 gallons in 1906-7) and Assam (3,156,665 gallons). The petroleum resources of India are capable of indefinite development. Burma furnishes the bulk of the jadestone (4001 cwts. in 1906-7) and all the rubies (296,125 carats, valued at £115,465).

MANUFACTURES. In 1906-7 the number of cotton mills in India (including Native States and French territory) was 217, with 5,546,388 spindles, 59,375 looms, and an average of 211,711 employees. In 1908 there were 5,699,898 spindles, which consumed during the year 1,548,838 bales of cotton. The cotton spinning

and weaving returns for British India, Berar, and Native States, for the year ended March 31, 1908, were as follows: Cotton yarn spun, 638,295,115 lbs.; gray and bleached piece goods, 155,084,079 pounds (680,046,821 yards); colored piece goods, 31,235,066 pounds (128,379,740 yards); gray and colored goods other than piece goods, 1,815,473 pounds; hosiery, 724,476 pounds; miscellaneous goods, 192,585 pounds.

The number of jute mills in British India in 1906-7 was 44; capital employed, £2,718,358; looms, 25,284; spindles, 520,504; employees, 166,805. The number of paper mills in 1907 was 8; employees, 5201; production, 55,215,703 pounds, valued at Rs. 7,290,385. The competition of cheap wood pulp paper imported from Europe has checked the development of paper making by the older methods. The following statement shows the number of works and persons employed in the other large industries in 1906:

	Works	Employees
Woolen mills	6	3,403
Government arms and ammunition factories	14	16,037
Coal mines	306	99,138
Cotton ginning, cleaning, and pressing mills	962	94,894
Dockyards, including government works	15	12,632
Gold mines	33	36,150
Indigo factories	196	102,148
Iron and brass foundries	74	26,123
Jute presses	126	23,639
Lac factories	62	5,869
Mica mines	358	15,723
Petroleum refineries	4	5,079
Printing presses	102	22,352
Railway open lines	34	391,865
Railway workshops	87	87,419
Rice mills	92	12,756
Saltpetre mines	—	50,469
Silk filatures	61	10,231
Tanneries	21	10,125
Tile factories	86	15,645
Timber mills, including government works	64	7,886
Woolen carpet weaving establishments not classed as mills	11	2,175

The number of factories subject to the Factory Acts in 1906 was 1732, with 690,712 employees, of whom 546,693 were men, 102,796 women, and 41,223 children.

FOREIGN COMMERCE. The sea-borne imports and exports in 1906-7 were valued at £107,881,339 and £121,595,051 respectively, against £95,843,170 and £118,203,751 in 1905-6. The imports and exports by land in 1906-7 were £6,609,306 and £5,178,597, against £6,266,261 and £4,903,864 in 1905-6. The foreign trade of 1906-7 was distributed as follows:

	Sea-borne Trade		Land Trade	
	Imports	Exports	Imports	Exports
Private Merchandise	£75,205,055	£117,710,942		
Government Stores	3,956,410	71,940		
Total Merchandise	£78,161,465	£117,782,882	£5,900,708	£4,412,530
Private Treasure	18,133,990	3,808,672		
Government Treasure	11,585,884	3,497		
Total Treasure	£29,719,874	£3,812,169	£708,608	£764,077
Grand Total	£107,881,339	£121,595,051	£6,609,306	£5,178,597

The sea exports of private merchandise in 1906-7 consisted of £115,388,249 of Indian produce and manufactures, and £2,322,693 of foreign produce and manufactures. Exports by sea of merchandise showed an excess of £39,621,417 over imports, and imports by sea of treasure showed an excess of £25,907,705 over exports, giving an excess of total sea exports over imports of £13,713,712. The principal imports of private merchandise by sea in 1906-7 were valued as follows: Cotton manufactures, £25,129,553; cotton twist and yarn, £2,148,773; hardware, cutlery, implements, etc., £1,769,004; machinery and millwork, £3,860,030; iron, £2,878,888; steel, £2,166,580; mineral oils, £1,617,978; provisions, £1,015,560; railway plant and rolling stock (exclusive of railway materials for State lines, £2,889,682), £2,772,260; silk manufactures, £1,216,697; sugar, £5,825,408; wool manufactures, £1,368,111. The principal exports of Indian produce and manufactures in 1906-7 were valued as follows: Raw cotton, £14,652,307; cotton twist and yarn, £6,931,021; cotton manufactures, £1,181,139; rice, £12,350,281; wheat, £4,836,310; raw hides and skins, £7,262,664; dressed and tanned hides and skins, £2,967,503; raw jute, £17,892,454; jute manufactures, £10,477,487; lac of all sorts, £2,333,182; opium, £6,205,281; seeds, £8,681,153; tea, £6,579,359; raw wool, £1,617,690. The trade by sea with the principal countries of origin and destination (imports of private merchandise and exports of Indian produce and manufactures) in 1906-7 was as follows:

From and to	Imports	Exports
United Kingdom	£ 48,198,645	£ 31,289,511
Austria-Hungary	2,045,655	4,012,295
Belgium	2,903,595	4,798,542
France	975,156	7,470,046
Germany	3,860,580	13,149,723
Netherlands	418,551	1,201,816
Italy	720,728	3,803,607
Spain	63,464	1,055,104
Egypt	104,777	1,316,820
Mauritius	1,445,055	832,740
Canada	1,656	517,942
United States	1,698,037	10,415,735
Ceylon	566,312	4,254,617
China, Hongkong	561,809	7,249,573
China, Treaty Ports....	433,923	5,318,539
Japan	1,073,401	4,729,964
Straits Settlements	1,845,726	4,352,661
Java	1,936,271	350,876
Australia	467,626	1,587,620
New Zealand	5,507	264,345

The land trade is principally with Afghanistan, Kashmir, Nepal, Western China, Shan States, and Siam. The valuation of this trade is still difficult and defective, especially as regards treasure. In 1907-8 imports by sea were valued at £119,188,000, and exports by sea at £121,814,000; imports by land were valued at Rs. 155,410,102 (about £10,360,673), and exports by land at Rs. 141,390,673 (about £9,426,045). The total value of the coasting trade in 1906-7 was £73,594,868, against £67,055,586 in 1905-6.

SHIPPING AND NAVIGATION. The total number of ships, with cargoes and in ballast, entered at Indian ports in 1906-7 was 4767, of 6,919,983 tons; of those cleared, 4562, of 6,855,453 tons. The United Kingdom and British

possessions furnished 4,765,972 tons of the tonnage entered, and 4,006,805 of the tonnage cleared.

INTERNAL COMMUNICATIONS. The railways had a length of 30,010 miles at the end of 1907, consisting of 22,355 miles of State lines; 905 miles of guaranteed company (Madras Co.) lines; 3117 miles of assisted companies' lines; 42 miles of unassisted lines; 3517 miles of Native State lines; and 74 miles of foreign lines (French and Portuguese India). The total capital outlay on railways to the end of 1907 was £265,621,000. Gross earnings during 1907 were £31,512,000; working expenses, £16,190,000; net earnings, £15,322,000; percentage of net earnings on capital outlay, 5.77; number of passengers, 305,890,000; tonnage of freight, 62,098,000; railway staff, 516,756 (7180 Europeans, 9982 Eurasians, and 499,594 natives). The length of government telegraph lines in 1906-7 was 67,587 miles; receipts, £838,590; working expenses, £644,205; net revenue, £194,385; total capital outlay to end of year, £6,563,757; percentage of net revenue on capital outlay, 2.95.

In 1906-7 there were 17,180 post offices; total strength of establishment, 85,873; gross revenue, £1,751,294; gross expenditure, £1,534,892.

BANKS AND JOINT-STOCK COMPANIES. In 1906 the three Presidency banks and 8 joint-stock banks whose head offices are in India had a capital of Rs. 49,394,033 (1 rupee equals 32.44 cents); reserve, etc., Rs. 33,625,035; deposits, Rs. 420,842,634; cash balance, Rs. 124,457,692. Ten Exchange banks whose head offices are not in India had in 1906 a capital of Rs. 15,866,592; reserve, etc., Rs. 8,421,339; deposits in India, Rs. 180,873,247; cash balance in India, Rs. 51,058,790. Post office savings banks had, in 1906-7, 1,190,220 depositors (105,212 Europeans; 1,085,008 native) with deposits amounting at the end of the year to Rs. 147,669,789. The number of joint-stock companies (including banks) in 1906-7 was 1922, with a paid-up capital of £29,512,583.

GOVERNMENT. The King of Great Britain and Ireland is Emperor of India. The administration of the Indian Empire in England is under the supervision of the Secretary of State for India, assisted by a Council of not more than 14 members, vacancies in which are filled by him. They are selected for a period of 7 years, chiefly from Indian ex-officials. In 1907 for the first time two Indian members were appointed. The appropriation and expenditure of the revenues of India, in India and elsewhere, require the concurrence of a majority of votes at a meeting of the Council; but in matters affecting the relations of the Indian government to foreign powers or Native States, the Secretary of State is independent of the Council. The supreme executive authority in India is vested in the Governor-General in Council, or government of India. The Governor-General, or Viceroy, in 1908, was Gilbert John Elliot, Earl of Minto, appointed in November, 1905. The Council consists at present of six members, appointed, like the Governor-General, by the Crown, besides the Commander-in-Chief, who is an extraordinary member. There are nine departments, each headed by a Secretary—Home, Foreign, Finance, Army, Military Supply, Public Works, Revenue and Agriculture, Commerce and Industry, and Legislative. Each depart-

ment is under the immediate care of one of the members of the Council, but the Foreign Department is always under the immediate supervision of the Governor-General. The Governor-General's Council is expanded into a legislative council by the addition of 16 members, appointed by the Viceroy, of whom one-half are non-official persons, and some are always natives. Subject to certain restrictions, the legislative council has power to make laws for all persons within British Territory, for all British subjects within the Native States, and for all native Indian subjects in any part of the world. In 1908 Lord Morley, Secretary of State for India, announced that in future there will be in the legislative council a number of native elective members, although a majority of the members will continue to be appointed and the will of the Viceroy will remain supreme. For administrative purposes, the territory is divided into great provinces, namely, Madras, Bombay (both under Governors), Bengal, Eastern Bengal and Assam, United Province of Agra and Oudh, the Punjab, Burma (these under Lieutenant-Governors), Central Provinces (under a Chief Commissioner), and the Northwest Frontier Province (under an Agent to the Governor-General), besides the minor divisions of Ajmer-Merwara, Coorg, British Baluchistan, and the Andaman and Nicobar Islands, each under a Chief Commissioner. The Governors are appointed by the Crown, the Lieutenant-Governors by the Governor-General with the approval of the Crown, and the Chief Commissioners, etc., by the Governor-General in Council. Each province has a council of its own. The administrative independence of the provinces varies with their importance and situation. Each province is usually subdivided into districts under Commissioners, and these again into districts under executive officers, styled Collectors, Magistrates, or Deputy Commissioners. These district executives act in some cases also as judges, and they usually have under them assistants, deputies, and other officials. The total number of these districts in British Territory is about 250. The municipalities have considerable latitude of action; but the imposition of new taxes or the enactment of new by-laws requires the sanction of the Provincial government. The municipal committees are mainly elected by the ratepayers. In 1906-7 there were 750 municipalities, with a total population of 16,760,517; their total revenue and expenditure, respectively, were £5,846,510 and £5,740,120. In rural districts, except in Burma, there are district and local boards, which have charge of roads, district schools, and hospitals.

The Native States are governed by the native princes, ministers, or councils, subject to the control of British Residents or Political Agents, in charge of a single State or a number of States. The Indian government may exercise over these States any degree of control in case of misgovernment, but, in general, the more important States are autonomous. Some of them are required to pay a fixed annual tribute. They have no right to make war or peace, to maintain relations with each other or external States, or to maintain a military force beyond a specified limit.

FINANCE. In 1906-7 the gross revenue was £73,144,554, of which £874,465 was obtained in

Great Britain. The expenditure charged to revenue was £71,555,179, of which £52,346,771 was spent in India and £19,208,408 in Great Britain. The capital expenditure on railways and irrigation works, not charged to revenue, was £8,712,668. Thus the total expenditure in 1906-7 was £80,267,847. The budget for 1907-8 estimated the gross revenue at £70,989,000, and the expenditure charged against revenue at £70,754,000. The principal estimates of revenue for 1907-8 were: Land tax, £18,525,000; opium tax, £5,223,000; salt monopoly, £3,337,000; stamps, £4,235,000; excise, £6,195,000; customs, £4,964,000; income tax, £1,482,000; forests, £1,742,000; post office, £1,834,000; telegraphs, £1,004,000; railways, £12,929,000; irrigation, £3,448,000. The principal estimates of expenditure in 1907-8 are: Land revenue collection charges, £3,523,000; opium tax collection charges, £1,663,000; interest on debt, £1,799,000; police, £3,785,000; law and justice, £3,442,000; education, £1,450,000; famine relief, £1,182,000; post office, £1,717,000; telegraphs, £1,091,000; railways, £11,001,000; irrigation, £2,834,000. The consolidated debt stood on March 31, 1907, at £234,488,677, of which £86,970,043 was contracted in India and £147,518,634 in Great Britain. The non-consolidated debt, contracted in India, was £19,359,942.

ARMY. For 1908-9 the established strength of the European and native armies (exclusive of native artificers and followers) was as follows: European army, 75,751 officers and men; European volunteers (efficients), 32,727 officers and men; native army, 158,932 officers and men; native Imperial service troops, 19,875 officers and men. The European army consisted of 53,802 infantry, 5652 cavalry, 15,854 artillery, besides engineers, etc. The native army consisted of 119,045 infantry, 23,976 cavalry, 16,672 artillery, 4980 engineers, etc.

HISTORY.

BORDER FIGHTING. The Zakka-Khels, a tribe of the Afridi, having made raids into British territory, a small punitive expedition under Maj.-Gen. Sir James Willcocks was dispatched into the Bazar Valley, leaving Peshawar on February 13. The tribesmen were taken by surprise, their towns were destroyed, and their principal strongholds were captured. The British withdrew on February 29, having imposed terms whereby other tribes of the Afridi guaranteed the good behavior of the Zakka-Khels and agreed to punish the chief offender. A disturbance on the Mohmand border was more serious. The Mohmands had made several raids and plundered the neighboring regions, and the situation was the more menacing from the presence of a strong body of Afghan allies. Gen. Willcocks, who was again placed in command, occupied a position on the frontier extending over 16 miles at Shabkadr, and finding his communications threatened began his attack on April 24. He routed them, inflicting a loss estimated at 100 and suffering only slight losses in return. A considerable Afghan force attacked Landi Kotal on May 1, but was driven back with loss, and Gen. Willcocks who arrived on the following day repulsed the remainder inflicting heavy losses. Meanwhile the Indian government protested to the Ameer against the participation of his subjects in the revolt and the Ameer replied that stringent orders had been issued recalling the Afghans and forbidding any

of his subjects to cross the border to the aid of the Mohmands. (See AFGHANISTAN.) The Mohmands still held out and on May 13 Gen. Willcocks proceeded against them, and destroyed a number of their towns. Some sharp fighting took place on May 20, in which the British casualties numbered 26 and the enemy's loss was estimated at 140 killed. By the end of the month the tribes had either submitted or been effectively punished and the British troops returned. The cost of the operations against the Zakka-Khels was estimated at £57,000, and of the operations against the Mohmands at £150,000.

FAMINE AND DISASTER. Great distress prevailed on account of scarcity of wheat and although the rainfall of February gave promise of better spring crops, the scarcity continued. Early in February the number in receipt of state relief was 738,934; in April it was estimated at 1,500,000 and in the summer 1,416,000 were engaged on relief works. At the close of the year conditions improved and the number in receipt of state relief was much less. At the beginning of October a disastrous flood was reported at Hyderabad. The loss of life could not be accurately determined, the official figures ranging from 5000 to 7000. It was estimated that 15,000 houses were destroyed and 100,000 people made homeless.

NATIVE UNREST. The National Congress opened at Surat on December 26, 1907, with 2000 delegates, but the meeting soon broke up in disorder owing to the irreconcilable differences between the Moderates and the Extremists, the latter opposing the election of Dr. Behari Ghose as president. The Moderates under Dr. Behari Ghose formed a committee to reconstitute the Congress on its original basis and work for ultimate self-government by constitutional means, while the Extremists under Mr. Tilak appointed a committee to carry on the work of the Congress in accordance with the Calcutta resolutions of 1906. The year 1908 was marked by an outbreak of crime and the publication of many seditious articles in the native press. On December 25, 1907, a Dacca magistrate was killed by a native at Golaunda. On May 1, 1908, a bomb was thrown at an Englishwoman's carriage at Muzaffarpur, Eastern Bengal, killing her and her daughter and coachman. In May a large number of bombs were discovered in Calcutta and evidence of a far-reaching anarchist plot was secured. It was reported that systematic anarchistic plans on a very large scale were being carried out, including a so-called anarchist "college" where instruction in the use and making of explosives was given. Over thirty persons were arrested. From the confessions of some of the prisoners it appeared that they had been incited by speeches and the press.

Great alarm was felt at the increase of anarchy in the country and repressive action was urged. On June 1, a bomb was thrown at a train in Eastern Bengal seriously injuring two men. On November 7, an unsuccessful attempt was made to assassinate Lieut.-Gov. Sir Andrew Fraser. Violent speeches and seditious articles in the press were frequent. On June 8 the Legislative Council adopted repressive measures dealing with the press and with the use of explosives. The former provided for the confiscation of the printing presses of any paper

publishing a seditious article and for stopping its issue, but action could be taken only on application from the local government. The press law was heartily approved by Lord Morley as a necessary means of preventing crime. In India the outbreak of lawlessness was generally attributed to the incitement of the newspapers and the government's repressive policy in this respect was favored by many prominent natives. On the passage of the press and explosive acts Lord Minto in an address to the Council scouted the view of certain critics that the assassinations and other outrages were the efforts of a downtrodden people to free itself from foreign oppression. The seditious spirit had, he said, come from abroad, and its doctrines were entirely new to India.

The new laws seemed for a time to have a quieting effect, but outrages soon began again and violent articles continued to appear in the newspapers. In July Mr. Tilak, the leader of the Extremists, was arrested on the charge of criminal libel in a newspaper article and sentenced to a fine and deportation for six years. Serious riots followed in Bombay. Many other editors were arrested on similar charges and sentenced to imprisonment or deportation. By newspaper articles and pamphlets and by secret agencies the attempt was made to sow sedition and especially to alienate the Indian troops and discourage recruiting by representing them as the mercenaries of the foreign oppressor and as underpaid. The latter attempts were unsuccessful, but an increase of pay was nevertheless decided upon and it was definitely promised in the royal proclamation to go into effect January 1, 1909. Among the agencies of revolt were the so-called Samitis and national volunteer companies, which were said to be intended as a nucleus for a military force to be employed against British rule.

In December the Vice-regal Council passed a Summary Justice measure, providing that anarchistic crimes should be tried by three judges of the High Court, the trial to be without jury but after impartial inquiry before a magistrate. It also provided for the punishment by fine and imprisonment of members of associations which encouraged violence or intimidation and heavier penalties for the managers of such associations.

THE KING'S MESSAGE. On October 30, the fiftieth anniversary of Queen Victoria's assumption of the government, an impressive Durbar was held at Jodhpur at which a message from the King was read. It referred to the purposes, difficulties and achievements of British rule; to what had been done to stop the ravages of plagues and droughts; to the promotion of works of public utility and improvement, and to the preservation of the rights of the feudatory princes and ruling chiefs, whose loyalty it commended. The King declared it the duty of the government to repress conspiracies, and expressed his faith in the loyalty of the great mass of his Indian subjects. He referred to the projected measures of reform and to the steps already taken to obliterate race distinctions as a test for public office and to introduce gradually representative institutions. As on the Coronation Durbar of 1903, he directed that the sentences of prisoners duly punished for offences against the law be remitted or reduced.

NATIVE DEMANDS. A prominent native of India at a public address in London toward the

end of the year gave the following account of native political aspirations and tendencies. The educated classes were, he said, much disturbed by the repressive measures of the present administration and had lost hope in any great political progress. Nine-tenths of these classes desired reforms; one-tenth wished separation from England. The older and more prudent supporters of the National Congress held that a long period of coöperation with the British was needed to develop capacity for self-government; but the young and ardent element, which was gaining influence, favored resistance and obstruction as a means of extorting concessions. Of those who aimed at independence most favored peaceful means, but there was a small but violent group of anarchistic tendencies, with a programme of physical force. Substantial reforms might conciliate the larger and peaceable element. Their national spirit was strong and it had been offended by the treatment of Indians in the other British colonies, for example, in South Africa and in Canada, which had shown them how little Imperial citizenship really meant. The present system in India was bad and he declared that the reform scheme promised by the government ought to complete the rural and urban machinery for self-government and introduce self-government into the provincial administration. The Provincial Councils ought, he thought, to be reorganized, with elected instead of official majorities and with a fair degree of native control over administrative and financial matters subject to the government's veto. The Executive Councils should be thrown open to Indians. The district administration should be decentralized and popular representatives associated with the heads of the district. The partition of Bengal ought to be modified. If these things were done and if amnesty were granted to political prisoners, he thought there would be a hope of allaying the present discontent.

THE GOVERNMENT'S REFORM PROPOSALS. The government's reform scheme above mentioned had long been under discussion between the Viceroy and the Chief Secretary for India and was eagerly awaited by the friends of progress. On December 17 Lord Morley announced the reform measures in the House of Lords. Their essential points were: To increase the number of the Legislative Councils, including both the Viceroys' and the Provincial Councils, and while retaining the method of nomination, to introduce election along with it "with a view to the due representation of all classes of the community"; to empower the Legislative Councils "to discuss matters of public and general importance, and to pass recommendations or resolutions to the government"; to establish Executive Councils for the Lieutenant-Governors to repeal the existing prohibition of resolutions or divisions in the Council in financial discussions. The plan retains the official majority in the Viceroy's Legislative Council but not in the Provincial Councils where Lord Morley declared they tended to "deadens the sense of trust and responsibility in the non-official members. The government would henceforth appoint native Indians to the Viceroy's Executive Council and to the Provincial Executive Councils. Representation in the Legislative Councils was to be secured by an electoral college, whose members should be proportioned to

the numerical ratio of Hindus to Mohammedans in the Province. Lord Morley outlined his suggestions on this point as follows: "I will briefly describe the scheme that at present commends itself to me, and in order to make the method of working clear, I will assume hypothetical figures for a given province. Let it be supposed that the total population of the province is 20 millions, of whom 15 millions are Hindus and 5 millions Mohammedans, and the number of members to be elected 12. Then since the Hindus are to Mohammedans as three to one, nine Hindus should be elected to three Mohammedans. To obtain these members, divide the province into three electoral areas, in each of which three Hindus and one Mohammedan are to be returned. Then, in each of these areas, constitute an Electoral College consisting of a hundred members. In order to preserve the proportion between the two religions, 75 of these should be Hindus and 25 Mohammedans. This College should be obtained by calling upon the electorates, which might be (a) substantial landowners paying not less than a fixed amount of land revenue; (b) the members of rural or sub-divisional Boards; (c) the members of District Boards; and (d) the members of municipal corporations, to return to it such candidates as they desired, a definite number being allotted to each electorate. Out of those offering themselves and obtaining votes, the 75 Hindus who obtained the majority of votes should be declared members of the College, and the 25 Mussulmans who obtained the majority should similarly be declared elected. If the Mussulmans returned did not provide 25 members for the Electoral College, the deficiency would be made good by nomination. Having thus obtained an Electoral College containing 75 Hindus and 25 Mussulmans, that body would be called upon to elect three representatives for the Hindus and one for the Mohammedans; each member of the College would have only one vote, and could vote for only one candidate. In this way it is evident that it would be in the power of each section of the population to return a member in the proportion corresponding to its own proportion to the total population. In the same way the desired proportion would be obtained of representatives of any particular interest, as, for instance, of landowners. All that is necessary would be to constitute the Electoral College in such a way that the number of electors representing the land-owning interest should bear to the total number the same proportion as the members of Council representing that interest to be elected bear to the total number to be elected."

The correspondence on the subject between the Secretary of State and the Indian government was at the same time presented to Parliament in a Blue Book. Lord Morley's speech on this occasion was widely praised for its candor and wisdom. He declared that he was far from aspiring to establish a Parliamentary system in India. But reform was necessary if political capacity were to have a chance to develop. "I am sick," he said, "of all the retrograde commonplaces about the weakness of concession to violence, and so on. Persevering in our plan of reform is not a concession to violence. Reforms that we have publicly announced, adopted and worked out for more than two years—it is no concession to violence to

persist in these reforms. It is simply standing to our guns." Nor did he believe the oft-repeated warning that the Oriental peoples invariably interpret kindness as fear. He approved the action of the present Indian government in rigorously suppressing popular disorders and the seditious press and denied that there was in it any infraction of liberty. The present disturbances were, in his opinion, sporadic and transitory. The situation was not so serious as many thought. India was on the whole loyal. The government would persist in its measures for enforcing order and would persist equally in carrying out the reforms to which it was committed.

INDIAN ATTITUDE TOWARD THE REFORMS. The scheme went further than had been expected by many of the natives and it was at first received by the moderate reform element with enthusiasm. The sacrifice of the official majority on the Provincial Councils was especially welcome and it was seen that the popular principle could be carried down through the district administration to the village. Already in the Bombay government the official majority in the Council had been given up and there was no longer any official participation in local bodies. The Indian National Congress, whose last meeting (December, 1907) had broken up in disorder, assembled on December 28 at Madras. Dr. Behari Ghose was elected president and in his address he declared his "emphatic approval of the projected reforms, for which the whole nation was deeply grateful." It was questioned, however, in certain quarters by the English whether this actually represented the sense of the people. The Congress stood for the educated classes in a country in which out of 226,000,000 inhabitants only 625,000 adults were, according to the last census, able to read and write English. As to the repressive policy, the president declared that it was bad as tending "to drive discontent beneath the surface." Resolutions were passed expressing loyalty to the King-Emperor, and approval of the reform scheme. There was some criticism of the Electoral College feature by the Moslems as unlikely to accord them actually a fair representation. But discussion had not fairly begun at the close of the year and it was too soon to learn the real attitude of public opinion either in India or Great Britain. At the All-India Mohammedan Conference at Amnitsar on Dec. 31 the president in his inaugural address declared that Mohammedans would not permit malice to warp their judgment or create disaffection in the relations with the government and that the best sense of the natives recognized that British occupation meant progress. The Congress closed on Dec. 30.

INDIA, PORTUGUESE. See PORTUGUESE INDIA.

INDIANA. One of the North Central Division of the United States. Its total area is 36,584 square miles.

MINERAL RESOURCES. The production of petroleum in Indiana shows a marked decrease in 1907 from the figures of 1906. In the former year there were produced 5,128,037 barrels as against 7,673,477 barrels in 1906. The decline in the production in the field which includes Indiana is largely accounted for by the new Illinois field on the West, which has in the last two years attracted many Indiana operators.

The value of the petroleum produced in 1907 was \$4,536,930 as against a value of \$6,770,066 for the product of 1906. In the production of coal Indiana ranks sixth among the States. There were produced in 1907 13,985,713 short tons, valued at \$15,114,300. The coal production has increased with marked rapidity during the last decade. The production of 1907 showed an increase over that of 1906 of 1,893,153 short tons, and in value \$1,988,039, or 15.66 per cent. in quantity and 15.23 per cent. in value. The production in 1906 was decreased on account of suspension of work by miners of the State pending a settlement of wage agreements. In 1907 the loss of time by reason of labor disaffection was inconsiderable. The aggregate production of coal in Indiana at the close of 1907 amounted to 157,440,390 short tons. There were killed in the mines of Indiana in 1907 53 men and 451 men were injured. In the mining of the coal 513 coal-mining machines were used. In the production of Portland cement Indiana ranks third among the States. There were produced in 1907 3,782,884 barrels, valued at \$4,757,860. This is a slight decrease from the production of 1906, which was 3,951,836, valued at \$4,964,855. Of natural cement there were produced in 1907 400,000 barrels valued at \$140,000 as compared with 600,000 barrels produced in 1906 with a value of \$240,000. Indiana produced clay products in 1907 to the value of \$6,858,124 as compared with the value of the product of 1906 of \$7,158,234. The State is a large producer of lime. In 1907 107,964 tons valued at \$335,151 were produced, a decrease from the product of 1906 which was 114,819 tons, valued at \$353,648. The value of stone products in 1907 was \$3,639,551 as compared with \$3,756,305 in 1906. Indiana ranks sixth among the States in the production of stone. Of the stone produced, limestone formed the greater part, the value of this product being in 1907 \$3,624,126. Other mineral products of the State are coal products including coal tar, illuminating gas, etc., pyrite, and oilstones. According to the figures of the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$39,141,217, as compared with a value in 1906 of \$34,472,776. Estimates indicate that the production of coal in 1908 was 25 to 30 per cent. less than in 1907. Most of this decrease is attributed to the unsettled financial conditions.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 137,835,000 bushels, valued at \$82,701,000, from 4,579,000 acres; winter wheat, 45,169,000 bushels, valued at \$44,266,000, from 2,721,000 acres; oats, 35,425,000 bushels, valued at \$16,650,000, from 1,671,000 acres; barley, 207,000 bushels, valued at \$135,000, from 9000 acres; rye, 945,000 bushels, valued at \$699,000, from 63,000 acres; buckwheat, 119,000 bushels, valued at \$93,000, from 7000 acres; potatoes, 5,130,000 bushels, valued at \$4,309,000, from 90,000 acres; hay, 3,750,000 tons, valued at \$33,000,000, from 2,500,000 acres; tobacco, 8,715,000 pounds, valued at \$1,045,800, from 12,450 acres. Winter wheat has varied greatly in production since 1900, with a minimum of 6,411,702 bushels in that year to a maximum of 48,080,925

bushels in 1906. The production in 1908 showed a marked increase over that of 1907, which was 34,013,000 bushels. The corn crop, on the other hand, showed a considerable decrease from the production of 1907, which was 168,840,000. The hay crop showed a slight increase in 1908 over 1907 when the figures were 3,143,000 tons. The decrease in the production of tobacco in 1907 was very marked, when 14,100,000 pounds were grown. The number of farm animals on December 31, 1908, was as follows: Horses, 830,000; mules, 920,000; dairy cows, 680,000; other cattle, 1,052,000; sheep, 1,215,000; swine, 3,033,000. All classes except swine show an increase since 1900. The estimated value of the wool clip in 1908 was \$1,219,680.

MANUFACTURES. A comparison of the results of the census of 1905 with those of 1900 showed a decrease of 1.2 per cent. in the number of establishments, but an increase of 42.3 per cent. in the amount of capital invested, of 10.9 per cent. in the average number of wage-earners, and of 16.9 per cent. in the value of products. The wage-earners in 1905 numbered 154,174, of whom 10,230 were women over 16 years of age, and 3393 were children under 16. The value of products in 1905 was \$393,954,405. The values credited to leading industries and, in parentheses, the percentage of increase over 1900 were: Flour and grist mill products, \$36,473,543 (25.6); slaughtering and meat packing, \$29,352,593 (33.1); foundry and machine shop products, \$23,108,516 (34.1) distilled liquor, \$20,520,261 (21); iron and steel (12.5 per cent. decrease); carriages and wagons, \$15,228,337 (20.3); glass, \$14,706,929 (3 per cent. decrease); lumber and timber products, \$14,559,662 (27.1 per cent. decrease); steam railroad shop work, \$14,515,330 (41.7), and furniture, \$13,496,778 (53.9).

EDUCATION. The consolidation of rural schools has grown very rapidly during the past seven years. The number of abandoned schools October 23, 1908, was 1807; the number of consolidated schools 432. At this time, 16,491 children were being transported at public expense. This movement has resulted in the marked extension of high school opportunities, and has developed a strong sentiment in favor of agricultural and industrial education, manual training, domestic science, etc. Among the more important laws of recent years are: The Teachers' Wage and Qualification Law puts all teachers in three classes according to qualifications in scholarship, professional training and experience. The salaries of teachers in the first class range from \$45.67½ to \$53.55 per month, depending on the scholarship shown on examination for license. The salaries of teachers in the second class range from \$57.96 to \$64.26; and the salaries of teachers in the third class range from \$71.29½ to \$74.97 per month. The normal school law provides for a system of normal schools in the State. The consolidation law provides for the abandonment of all schools in the State which had an average daily attendance during the last preceding school year of 12 pupils or fewer, and permitting the school authorities to abandon all schools with an average daily attendance of 15 or fewer. The law also provides that the school officials shall transport the pupils in comfortable and sanitary hacks at public expense. The law raising the State tax produced in 1908 about \$500,000 with

which to pay the extra wages required by the Minimum Wage and Qualification Law. The Deficiency Law provides for the levying of a small State tax, the revenue from which enables the poor townships and towns of the State to establish high schools, pay the minimum salaries, support the minimum term of schools, etc. This law places the schools of the State practically on a seven-months term basis. The common schools are defined as follows: (a) Elementary schools, and (b) high schools. The elementary schools shall include the first eight years of school work, and the course of study for such years which is now prescribed or may hereafter be prescribed by law. The commissioned (standard) high schools shall include not less than four years' work following the eight years in the elementary schools. The high school course in non-commissioned high schools shall be established and amended or altered from time to time, as occasion may arise, by the State Board of Education. All classes of high schools shall be under the direction of the State Board of Education. These laws are all of recent origin.

A statement from the State Superintendent of Public Instruction gives the school population (ages 6 to 21) as 764,678 in 1908. The total enrollment was 531,731, and the average daily attendance 422,116. The average length of school term for all schools was 145 days, being 173 days in cities, 154 days in towns and 140 days in townships. The number of commissioned high schools having courses of two to four years, was 454, of which those having a course of four years of eight months each numbered 270; and the number of certified high schools—those having a course of four years of seven months, or of three years of eight months each—was 80. The number of teachers employed in commissioned high schools was 1428 in 1908, and in non-commissioned, 628. The total expenditure for common schools in 1908 was \$12,879,015.57. The amount of the congressional township fund August 1, 1908, was \$2,474,152.38½, and of the common school fund, \$8,528,210.47.

FINANCE. The balance in the treasury September 30, 1907, was \$1,096,459.82. The total receipts for the fiscal year following were \$10,271,991.16, and the total expenditures, \$10,759,365.10, leaving a balance September 30, 1908, of \$609,085.88. The funds showing the largest receipts were the general fund, \$6,092,567.10; the school revenue fund for tuition, \$2,792,983.40; the benevolent institution fund, \$830,667.28, and the educational institution fund, \$456,887.27. The general fund is derived mainly from the property tax, with considerable additions from insurance and corporation taxes and fees. About 80 per cent. of the school revenue is derived from current taxes and 20 per cent. from interest on the school fund. The total debt of the State, September 30, 1908, was \$1,510,163, of which \$805,615 was classed as foreign, and \$704,548 as domestic debt. The latter consisted mostly of \$144,000 of Indiana University bonds held by the State Treasurer, and \$340,000 bonds held by Purdue University. Outstanding warrants amounted to \$23,239.96.

CHARITIES AND CORRECTIONS. The following institutions are under the care of the State Board of Charities. Their populations in 1908 are given in parenthesis: The Central Hos-

pital for Insane (1050); Northern Hospital for Insane (938); Eastern Hospital for Insane (779); Southern Hospital for Insane (669); Soldiers' Home (828); Soldiers' and Sailors' Orphans' Home (435); Village for Epileptics (81); School for Feeble-minded Youth (1096); Indiana State School for the Deaf (288); Indiana School for the Blind (128); State Prison (1128); State Reformatory (1250); Indiana Woman's Prison (91); Indiana Girls' School (235); Indiana Boys' School (544); total number of inmates in these institutions is 10,340 of which 6365 were males and 3975 were females. The records of the five State penal and correctional institutions show an increase in population in each except the Indiana Girls' School. For the fiscal year ending September 30, 1908, there was expended for the maintenance of these institutions \$1,800,469, which was \$179.69 per capita. The Legislature of 1907 enacted more laws relating to public charities than any two previous General Assemblies. Among these was the new law for uniform management of State institutions. The enactments of 1907 proved during 1908 to be of great value. The Commission appointed for the establishment for the treatment of tuberculosis selected a site at Rockville in Park county. A new law relating to adult probation enacted in 1907 shows excellent results.

POLITICS AND GOVERNMENT. The passage of the county local option bill, at a special session of the Legislature, called by Governor Hanly in September, was the most important event of the year in the political history of the State. The bill is an amendment to the Nicholson Act of 1895, which provided for local option by remonstrance for townships and wards. The new law makes a county dry by the vote of the people. The bill met with bitter opposition throughout the State among members of both political parties. It had, however, the support of Governor Hanly and probably of a majority of the voters of the State. The Legislature met on September 18. When the bill came up for passage on September 21, there was seen one of the most remarkable demonstrations in the legislative history of the State. Hundreds of ministers, members of church organizations and Sunday School workers assembled in the corridor of the State Capitol and engaged in a prayer and song service preliminary to lobbying with the members believed to be opposed to the local option bill. The demonstration was arranged largely by the Anti-Saloon League. The bill was passed by the Senate by a vote of 32 to 17, all the Democrats (14) and three Republicans voting in the negative. The real struggle was in the House, where, after a contest lasting several days, the bill was passed by a vote of 55 to 45. The result was a surprise to both Republican and Democratic managers, who had not expected that the law would pass. Six Democrats voted for it and four Republicans against it. During the progress of the voting charges were made by a member that he had been offered a bribe by the Governor and a Senator to vote for the bill. A committee composed of two Democrats and two Republicans was appointed to investigate these charges. The report of the committee unanimously declared that the Governor had not offered a bribe. It also reported that the evi-

dence did not justify any charge against the Senator. For political events in Indiana connected with the national campaign, see the article **PRESIDENTIAL CAMPAIGN**.

CONVENTIONS AND ELECTIONS. The Republican State Convention met at Indianapolis on April 1, to select delegates to the Republican National Convention and to nominate State officers. A resolution which was said to have been written by Vice-President Fairbanks was passed, calling for the revision of the tariff. Planks were incorporated in the platform condemning child labor, opposing contributions from corporations, reducing army and navy expenditures, and modifying the financial system. The delegates selected for the National Convention were instructed to vote for Charles W. Fairbanks for President. James E. Watson, of Rushville, a representative from Indiana in Congress, was nominated as candidate for governor. The Democratic State Convention met at Indianapolis on March 25. The platform adopted referred to William J. Bryan in most eulogistic terms and instructed the delegates selected to vote for him for President. John Kern was indorsed as candidate for the vice-presidency. A tariff revision plank was adopted, the Fowler and Aldrich financial bills were disapproved, and President Roosevelt was rebuked for attempting to "dictate the nomination of his successor." After considerable discussion the township and ward system of local option was indorsed. Thomas R. Marshall, of Columbia City, was nominated as candidate for Governor.

For reasons connected with local issues of the State, Indiana was counted as one of the most "doubtful" of the States in the presidential campaign and it was one of the hardest fought battle grounds until the issue was finally settled. The State in recent national elections has given its vote by a large majority for the Republican candidate, and it is under ordinary circumstances reckoned as a Republican State. In the election of November 3, the State gave a majority of only 10,731 votes to William H. Taft, while the Democratic candidate for Governor was elected by 14,809 majority and part of the Democratic State ticket was elected. James E. Watson, the defeated candidate for Governor, ran behind Mr. Taft in nearly every county in the State except his own county. The Republican leaders attributed the loss in the State to the weakness of their candidate, to complications arising from the passage of the local option bill and to opposition to Governor Hanly and the measures which he advocated. The actual vote cast for national and State tickets was as follows: Taft, 348,993; Bryan, 338,262; Chafin, 18,045; Debs, 13,476; Marshall, 348,493; Watson, 334,040.

OTHER STATE EVENTS. Violent disturbances occurred in Muncie in January as a result of a strike of the employees of the street railway. There was much rioting and the town was placed under martial law on January 4. Many persons were injured and much property was destroyed during the progress of the strike. (See **STRIKES AND LOCKOUTS**.) A section of the State was invaded on May 10 by a band of "night riders," presumably from Kentucky, who made their appearance in Dearborn and Switzerland counties, destroying beds of tobacco plants and leaving notices warning growers not to attempt making crops in 1908. The new

steel city of Gary celebrated, on July 23, the formal opening of its deep water harbor and received through it the first large shipment of iron ore which is to be manufactured into steel in the great mills erected there. (See **IRON AND STEEL**.) On May 3, the new Aveline Hotel at Fort Wayne was burned and 12 persons perished in the flames. A bronze statue of former President Benjamin Harrison was unveiled at Indianapolis on October 27, and a monument to the heroes of the battle of Tippecanoe was dedicated on the battle ground on November 7. Sixteen monuments, erected by the State on the battlefield of Vicksburg, in memory of the Indiana soldiers who participated in the siege, were dedicated on December 29. A tract of land in the Western part of the State, containing 500 acres was purchased at a cost of \$24,000 for the establishment of a hospital for the treatment of tuberculosis. The year was marked by one of the longest droughts in the history of the State, prevailing very generally and almost without interruption from the middle of August until late in the fall, and seriously affecting crops.

STATE OFFICERS. Governor, Thomas R. Marshall; Lieutenant-Governor, Frank J. Hall; Secretary of State, Fred A. Sims; Treasurer, Oscar Hadley; Auditor, John B. Billheimer; Attorney-General, James Bingham; Adjutant-General, Oran Perry; Superintendent of Education, F. A. Cotton; Commissioner of Insurance, Auditor *ex officio*—all Republicans except Marshall and Hall, Democrats.

JUDICIARY. Supreme Court: Chief Justice, John H. Gillette. Justices, John V. Hadley, James H. Jordan, Leander J. Monks, Oscar H. Montgomery; Clerk of the Court, Edward V. Fitzpatrick—all Republicans.

The State Legislature of 1908 was composed of 27 Republicans and 23 Democrats in the Senate, and 40 Republicans and 60 Democrats in the House. The State representation in Congress will be found in the article **UNITED STATES** under the section *Congress*.

INDIAN EDUCATION. See **INDIANS**.

INDIANA UNIVERSITY. An institution of higher learning at Bloomington, Ind., founded in 1820. It is co-educational. The attendance in 1907-8 was 2051. The faculty numbered 80. The library contained 65,000 volumes. The total valuation of buildings and grounds is \$816,084.28; the income for the year ending Sept. 30, 1908, was \$236,657.64, of which \$166,140.83 came from State funds. The endowment is \$700,000. The President is Dr. W. L. Bryan.

INDIANS. Francis E. Leupp, the Commissioner of Indian Affairs, is continuing his policy of educating the Indian along the lines of self-supporting activity. For this end he pays frequent visits to the reservations and makes special efforts to secure for the Indians work in neighboring localities. While serious attention is paid to the problem of aiding the adult aborigines, vigorous attempts are made to train the Indian child for the competitive struggle for existence in which he will have to take part.

This extremely important work is carried on under the immediate supervision of Miss Estelle Reel, Superintendent of Indian Schools. The fundamental axiom on which both her and the Commissioner's educative scheme rests is the

necessity of developing the Indian child along natural lines, instead of vainly attempting to transform him at one bound into a wholly different creature; hence the necessity of modifying current pedagogic methods and of adapting them to the peculiar requirements of Indian schools. Naturally, the most important task is to teach the Indian child to speak English. To attain this end, Miss Reel insists on adequate drill work and on concrete methods. Instruction is begun with illustrations and objects already familiar to the pupil, and as much oral work as possible is required in recitations. Next to English in practical importance, industrial training and domestic economy are given a conspicuous place in the Indian school schedule. While formerly instruction in cookery was confined to having the girls assist the school cook, cooking is now made a distinct subject in the curriculum, and graded lessons are given in the preparation of food. Much has been done to stimulate an interest and understanding of agricultural operations. Not only are the processes of germination demonstrated in the class room, but in the spring the children, under the guidance of the teacher, are directed to perform the actual work of laying out garden plots, preparing the soil, planting, tending the growing plants, and harvesting the crop. Wherever feasible, individual gardens have been allotted to the smaller pupils. Considering that much of the supervision, if not the actual work, of gardening devolves on the average farmer's wife, the course of instruction is extended to girls as well as to boys. In localities where stock raising is the principal industry, special attention is paid to this subject. Instruction in the class room is followed by a visit to the barn or pasture, where practical directions are given as to the management of stock, the characteristics of different breeds and the raising of calves. Progress is reported in dairy work. Both boys and girls are taught to milk and the need for sanitary precautions is insisted upon. The practical operations have been advantageously combined with recapitulation of language and arithmetical study; indeed, in every department an earnest effort is made to correlate different subjects of instruction. Of fundamental importance is the policy of superseding the old boarding schools with day schools. In this way, the objection of Indian parents to the inevitable estrangement from their children resulting from their separation during the entire school term is precluded, and at the same time the plan of education is brought into line with that of our American public school system.

A gratifying result of the Indian school training has been the profitable employment found by large numbers of pupils during the past year through the intermediation of employment bureaus established by Mr. Leupp. A very original scheme for developing already extant Indian activities in an economically fruitful way is that of adapting Indian art to modern usages,—a task delegated to Miss Angel De Cora of the Carlisle Indian School, Carlisle, Pa. Miss De Cora endeavors to perpetuate aboriginal art motives by application to modern articles of use and ornament. The pupils are encouraged to design friezes, borders, rug patterns, etc. The ultimate object is to find a place for Indian art such as the Japanese have found for theirs, and the attitude evinced by Indian art students at

Carlisle seems to justify the most optimistic expectations.

INDO-CHINA, FRENCH. See **FRENCH INDO-CHINA.**

INDO-SCYTHIAN LANGUAGE, or **TOK-HARIC.** A newly discovered Indo-Germanic language of Central Asia, known from a few fragments of a translation of the lost Sanskrit *Maitreyasamiti*, found in Turfan (q.v.). Two dialects seem traceable, one characterized by case-endings of nouns, and the other by postpositions (e.g., ablative *paltkas* ["knowledge"] as compared with *palsko-mem*). The verb is yet represented only scantily, though stem-gradation and active, middle, and passive voices seem to exist. By far the most striking feature of the language lies in the fact that in phonology it belongs to the *centum*-group, or the European division of Indo-Germanic, instead of to the *satam*-group, or the Asiatic division (cf. *kandh*, *kante*, "hundred," with Latin *centum*, but Sanskrit *śatam*; *yakwe*, "horse," with Latin *equus*, but Sanskrit *āśva*). This phenomenon of finding a single Indo-Germanic language in Central Asia showing in phonology the one characteristic hitherto supposed to be distinctively European is nothing short of astounding. Other phonological peculiarities of the dialect are the change of Indo-Germanic dentals into palatals (*pācar*, "father," Sanskrit *pitar*, Latin *pater*) and the change of *mediæ* to *tenues* (*ckācar*, "daughter," Greek *θυγάτηρ*). The latter change finds its analogue in the Indian dialect of *Čili-kāpāišāci*. Consult Sieg and Siegeling, "Tocharisch, die Sprache der Indoskythen," in *Sitzungsberichte der königlich preussischen Akademie der Wissenschaften*, 1908, pp. 915-934.

INFANTRY. See **MILITARY PROGRESS.**

INGALLS, CHARLES RUSSELL. An American jurist, died at Troy, N. Y., on May 28, 1908. He was born at Greenwich, N. Y., on Sept. 14, 1819, and after studying law in his father's office was admitted as an attorney in 1844 and as counsellor in 1847. In 1853 he represented Washington County in the New York Assembly. He removed to Troy in 1860, in 1863 was elected a justice of the Supreme Court of New York, was reelected in 1871 and 1885, and retired, having reached the age limit, on Jan. 1, 1890. He served by designation as judge of the Court of Appeals in 1870 and on the general term of the Supreme Court in the First Department in 1877-78. Judge Ingalls was well known for his learning and fairness and for the lucidity of his opinions and charges to juries.

INITIATIVE AND REFERENDUM. A feature of the present political development in the United States is the growth in the use of the initiative and referendum. In 1908 Maine, Michigan, Missouri, and North Dakota voted on their adoption in State matters, the Maine law extending its application also to local affairs. Since the adoption of these devices for securing direct expression of the people's will by South Dakota in State affairs, in 1898, they have come into use in many States, and at an accelerating rate. Utah followed in 1900, Oregon in 1902, Montana in 1906, and Oklahoma in 1907. In 1907 also Iowa, Montana, and South Dakota adopted the initiative and referendum for use

in local affairs. While the referendum has long been in use in local affairs, as well as in State affairs, the adoption of the initiative, making it possible for voters to frame and pass new laws without reference to representative legislative bodies, is a recent and striking evidence of the growth of democratic institutions.

The referendum vote on the authorization of the initiative by constitutional amendment was carried in Maine on Sept. 14, by 18,000 votes, in a total of 85,700, carrying every county in the State. The provision requires 12,000 signatures for an initiative petition and 10,000 for the referendum on any act or resolution passed by the Legislature. The law provides for the adoption of the initiative and referendum by any town or city by a majority vote. In Missouri also the initiative and referendum were adopted by constitutional amendment ratified at the November election, while in Michigan the new constitution, ratified at the same time, authorizes the use of these methods of legislating. The referendum is granted on all municipal legislation, and its use on franchise grants is made compulsory. The peculiar feature of the Michigan law is that while twenty per cent. of the voters are required for a petition to initiate a constitutional amendment, such a proposal may be vetoed by a majority of the Legislature. In Ohio, the vote in November on the adoption of the initiative and referendum by constitutional amendment gave a majority against the proposal. However, the friends of the measure believed this result was due to a lack of sufficiently general understanding of these principles, and have drawn another amendment for introduction in the 1909 Legislature. In August, the Supreme Court of Oklahoma upheld the constitutional provisions for initiative and referendum, the same having been made effective by a legislative act of April, 1908, and not being in conflict with that provision of the United States Constitution guaranteeing every State a republican form of government. In Oregon, where the principle of direct legislation has been most effectively used, the people voted, on June 1, on 19 measures, of which 12 were adopted. Woman suffrage was the most notable of the proposals rejected, while among those adopted were the right of recall and proportional representation. The adoption of these two principles illustrates how the initiative and referendum favor an increased use of governmental devices securing a more effective expression of popular will. The right of recall enables a proportion of the voters to secure the recall of an elective officer and the holding of a new election, while proportional representation provides for minority representation in legislative bodies. In Oregon the farmers have developed a strong organization for the effective use of the initiative and referendum in furthering their demands for equitable taxation. The platform of the Independence Party in 1908 favored these principles, along with the right to recall and direct primaries (q.v.). Bills favoring their use in national affairs were introduced in Congress early in the year. A movement favoring the adoption of the initiative and referendum in local affairs is the spread of the commission form of government..

The success of the direct legislation in Switzerland, where first adopted, was attested by John A. Hobson, English economist and publicist. After a first hand study he summarized the advantages as follows: (1) It provides a remedy

for intentional or unintentional misrepresentation on the part of the legislatures; (2) it enhances popular confidence in the stability of law; (3) it eliminates much waste of political energy; (4) but most of all, it renders an inestimable service in the training given the average citizen in the art of self government. See PRIMARIES, DIRECT.

INJUNCTIONS. The most discussed labor event of the year was the controversy over the rightful use of injunctions in labor disputes. In 1906 the American Federation of Labor had instituted a boycott against the Buck's Stove and Range Company, as a result of a dispute between the company and the Metal Polishers' Union. This boycott was carried on by publishing the company's name in the "unfair" and "We don't patronize" lists of *The American Federationist*. The company brought suit in the Supreme Court of the District of Columbia for an injunction restraining the Federation, its officers, and members, from prosecuting the boycott. On Dec. 18, 1907, Judge Gould of that court issued a temporary restraining order, to become operative Dec. 23. This injunction was made permanent Mar. 23, 1908. In issuing the injunction, Judge Gould cited opinions of Judge Wm. H. Taft in boycott cases, and ventured the opinion that, although individuals may refuse to patronize a firm, the inciting of others to do so constitutes a conspiracy in restraint of trade. The injunction restrained the defendants from "publishing or otherwise circulating, whether in writing or orally, any statement or notice of any kind or character whatsoever, calling the attention of the complainant's customers, or of dealers or tradesmen, or the public, to any boycott against the complainant, its business or its product," and from advising any one not to purchase or handle the complainant's goods or by any other form of representation or statement interfering with his business. President Gompers of the Federation characterized the injunction as the most sweeping invasion of the liberty of the press and of the right of free speech ever issued. It was pointed out in press comments that the language of the injunction would prevent the publication of any society or organization, as well as ministers and social workers representing religious, charitable, or good-government societies, from striking at obnoxious business or business devices.

Recognizing that the source of relief from present conditions lies in Congressional action, Mr. Gompers and other labor organizers made an effort to secure favorable legislation at Washington. President Roosevelt, in messages, had urged upon Congress the "need of some action in connection with the abuse of injunctions in labor cases." He said, "It is all wrong to use the injunction to prevent the entirely proper and legitimate action of labor organizations in their struggle for industrial betterment, or under the guise of protecting property rights, unwarrantably to invade the fundamental rights of the individual." About the same time that Mr. Gompers's bill was introduced, another was presented by the Civic Federation, headed by Hon. Seth Low, incorporating moderate changes in the manner of issue of injunctions and of punishment of their violation. The controversy was so determined that inaction resulted. The chief opposition to the demands of the labor leaders came from the National Association of Manu-

facturers and its subsidiary, the National Council of Industrial Defense. In the fall of 1907, the Association had decided to devote \$500,000 annually for three years to "a campaign of education," the National Council being formed for this purpose. The personal animus between its president and the head of the Federation of Labor led their organs, *American Industries* and *The American Federationist* respectively, to express views having an air of undignified hatred.

Having failed in Congress, the labor leaders went before the national party conventions. The Republican platform, after expressing confidence in the integrity of the courts and insisting "that their powers to enforce their process . . . be preserved inviolate," declared that the rules of procedure "with respect to the issue of the writ of injunction should be more accurately defined by statute, and that no injunction or temporary restraining order should be issued without notice, except where irreparable injury would result from delay, in which case a speedy hearing thereafter should be granted." The Democratic platform likewise expressed confidence in the courts, but declared that "if judicial processes may be abused we should guard them against abuse." It declared that "experience has proven the necessity of a modification of the present law relating to injunctions" and favored providing for trial by jury in cases of indirect contempt. With reference to the issue of injunctions in industrial disputes, it declared "that injunctions should not be issued in any cases in which injunctions would not issue if no industrial dispute were involved." The labor leaders accepted the latter declaration as the more favorable to their interests and entered into the campaign in behalf of Wm. J. Bryan.

The nomination of Wm. H. Taft as the Republican candidate for the Presidency was another reason for trade-union agitation of the injunction matter, for when a United States Circuit judge, Mr. Taft had issued certain injunctions, which won him the title of "father of injunction." Taft's injunction record was much discussed, the candidate himself expressing perfect willingness to stand or fall by it. It may be briefly stated. In 1893, the engineers on the Toledo, Ann Arbor and Michigan Railroad went out on strike; the chief of the Brotherhood ordered engineers on connecting lines not to handle freight cars from that road. Judge Taft issued a temporary injunction restraining the engineers from carrying out this order. This was the first judicial decision defining the rights and duties of organized labor in interstate commerce. It did not deny the right to strike, but forbade interference with interstate commerce, as conspiracy against federal law. This virtually declared the boycott illegal in interstate commerce. This decision has since been quoted frequently. In 1894, the American Railway Union, led by Eugene V. Debs, began a strike against the Pullman Company, and all railways were ordered to boycott Pullman cars on penalty of a railway strike if they did not do so. The Cincinnati Southern refused. Frank Phelan began to organize a strike among its employees. Judge Taft issued an order restraining him and afterward sentenced him to six months in jail for contempt in disobeying the order. Here again Mr. Taft upheld the right of the workmen to quit work, but forbade the use of the boycott in interstate commerce. Speaking before a large audience at Cooper Union, New York City, early

in 1908, Mr. Taft defended the injunction against the charge that it gave to courts not only judicial but also legislative and executive powers. He said that prevention of injury to business, to property, and to life, even at the cost of occasional injustice, was preferable to the alternative of curing wrongs, after harm had been done. He admitted, however, that the use of the injunction in labor disputes had been abused and expressed sympathy for an amendment to the law providing that no temporary injunction should be issued until after notice and a hearing. He preferred also that proceedings for contempt of an injunction order be held before some other judge than the one issuing it.

In the course of the agitation carried on by President Gompers and other officers of the Federation, they were alleged by the Buck's Company to have violated their injunction. They were therefore, on July 20, ordered by the court to show cause on September 8 why they should not be punished for contempt, because of such violation. The contempt proceedings were, however, postponed; it was alleged that the delay was due to the desire of Republican leaders to have the matter settled after the close of the campaign. The decision, finally made by Judge Daniel T. Wright, near the end of December, found the defendants, President Gompers, Vice-President Mitchell, and Secretary Morrison, of the Federation, guilty and sentenced them to imprisonment for one year, nine months and six months, respectively. The court found that there had been numerous violations of the injunction. The opinion specified that between the rendition of Judge Gould's opinion (Dec. 17, 1907), and the date when the injunction became effective (Dec. 23), Mr. Gompers had issued an edition of *The American Federationist* in which the Buck's Company was included in the "Unfair" list. Many copies of this issue did not reach their destination until after Dec. 23. In the second place, Mr. Gompers had repeatedly discussed the injunction in his periodical in such a way as to incite his partisans to prosecute the boycott. The court found that repeatedly statements were made in bold-faced type announcing that the Federation was prohibited from "publishing the fact that the Buck's Stove and Range Company is on the unfair list of organized labor," or that "this injunction cannot compel union men or their friends to buy Buck's stoves and ranges." As against Vice-President John Mitchell, it was shown that he was not lawfully minded toward injunctions by the following quotation from a book published by him in 1903: "When an injunction forbids the doing of a thing which is lawful, I believe that it is the duty of all patriotic and law-abiding citizens to resist, or at least to disregard, the injunction." Moreover, Mr. Mitchell had presided at a meeting of the United Mine Workers of America in January, 1908, when the Buck's Company was by formal resolution placed on the unfair list. The labor leaders at once appealed from the decision to the Court of Appeals of the District of Columbia.

The attitude of the defendants in this case, partially shown in the foregoing quotation from John Mitchell, was that the fundamental issue was the right of organized labor to use the constitutionally guaranteed rights of freedom of speech and of the press in prosecuting its struggle for better conditions. Having been restrained in the exercise of what they considered

perfectly lawful activities, they deemed it best, in the interest of labor's welfare, to defy the order and accept the consequences. By this means, they hoped in the end to get from the Supreme Court of the United States a definition of the rights of the labor press in trade disputes. Public comment generally sustained the court in finding the men guilty of contempt, for the question before the court was not the rightfulness of the injunction, but only its violation. Since, however, the main object in the case was to make an issue of the legal rights of the defendants, opinion generally condemned the severity of the sentences.

Following the condemnation many trade unions passed resolutions sustaining the attitude of their leaders and condemning that of Judge Wright. On Dec. 28, President Gompers notified union labor that, pending an effort to secure action from Congress, the "Unfair" list in *The Federationist* would be discontinued. See also **BOYCOTT**, and **LABOR**, **AMERICAN FEDERATION OF**.

Naturally, the subject of the injunction received extended discussion at the annual convention of the American Federation of Labor in November. The more radical members favored a declaration that "it is our duty to disregard them [injunctions] and we recommend that such be our action, taking whatever results may come." However, the resolution finally adopted was less direct in form: "We will exercise all the rights and privileges guaranteed to us by the constitution and the laws of our country, and insist it is our duty to defend ourselves at all hazards," taking the consequences that may result. This resolution, like the writings and speeches of prominent labor leaders during the year, lays stress upon the "rights" and "liberties" guaranteed by the laws, that is, freedom of speech and of the press, which the injunction in the Buck's case restricted. This appeal, however, did not strike an enthusiastically responsive chord in public sentiment, for it was contended that the rights restricted were only limited by the desire of the court to preserve equally important rights for a business firm. The fight made in Congress earlier in the year was renewed in the second session of Congress. In a statement issued on Dec. 27, President Van Cleave stated that there were already before the Judiciary Committee of the House ten bills intended to restrict the use of writs of injunction. He therefore gave notice that the fight made early in the year would be renewed.

Numerous less well-known injunctions were issued or denied during the year, some of which were of importance. Judge Van Devanter of the United States Circuit Court of the Eighth Circuit, in September, granted to the St. Louis, Iron Mountain and Southern and three other railroads operating in Arkansas an injunction against the Arkansas State Railroad Commission, restraining the latter from enforcing the State two-cent fare law and from interfering with the roads in increasing freight rates on interstate business. The court held the two-cent rate to be unprofitable and therefore unreasonable, and that the laws of Congress should take precedence over State laws so far as interstate business is concerned. The Chicago Typographical Union was fined for violating an injunction by the Supreme Court of Illinois. The injunction forbade picketing. The Union appealed, but

meanwhile continued peacefully to picket. The court held that the taking of an appeal does not justify the violation of an injunction. Certain theatrical managers in New York City secured from a city judge injunctions restraining the police from enforcing the laws against Sunday concerts and theatrical performances. The ground on which the injunction was issued was that the acts forbidden by the law are not crimes. The Appellate Division of the Supreme Court of New York in May declared the injunctions to be illegitimate, on the ground that a police officer could not be restrained from enforcing the law so long as the law itself remained valid. The Switchmen's Union at Buffalo decided to strike: the Delaware, Lackawanna and Western Railroad Company sought to enjoin the members of the Union from doing so, on the ground that by an agreement they had bound themselves to work for the company on certain conditions until an assigned future date. The United States Circuit Court refused the injunction on the ground that members of labor organizations may peaceably withdraw from employment, even though such withdrawal involves a breach of contract, and on the ground that in this case no violation of property rights was shown. The Sailors' Union of the Pacific was prohibited by the United States Circuit Court of Northern California from interfering with the business of the Hammond Lumber Company. The Union had gone on strike, picketed the waterfront, patrolled the coast and used violence and threatening language against boat crews of the company: all of these activities were enjoined. The Union contended on appeal that the court had exceeded its legal powers in restraining members from doing what they had a legal right to do. The Circuit Court of Appeals sustained the injunction, on the ground that its object was not to prevent the members of the Union from exercising any legal rights, but "to prevent acts of lawlessness, of violence, of insult, and of intimidation." Two cases decided by the Massachusetts Supreme Court attracted considerable attention. A member of the Carpenters' Union at Lynn was discharged by a firm belonging to the Master Builders' Association. The Union ordered a strike to compel his reinstatement. The Association was granted an injunction restraining the Union from striking, picketing, or boycotting so as to interfere with the business of any Association member. The court held that the combination to strike was, in this case, not to further the common interests of workmen, but was a sympathetic strike in behalf of one employee, and that it involved interference with the employer's business in that the Union attempted to determine who should be employed. Unionists made much of this decision as a long step in the direction of limiting the right to strike. In the other case a Boston Bricklayers' Union was enjoined from fining two of its members, who, contrary to the rules of the Union, had refused to go on a strike when ordered to do so. The court held that the rule of the Union fining members for not striking when ordered to do so was contrary to public policy and interfered with the employer's right to a free labor market. There was a strong minority opinion in this case, which stated that "the law does not do so vain a thing as to allow the formation of labor unions and to declare their right to initiate and by lawful means to carry on a justifiable strike, and then refuse them the use of the only

practical means by which their acknowledged rights may be secured."

INLAND WATERWAYS. See CANADA, and UNITED STATES, paragraph *Internal Waterways and National Resources*.

INOUE, HIKARU. A Japanese soldier, died in Kioto on Dec. 16, 1908. He was born in the province of Choshu in 1851 and enlisted in the army in 1871, rising by reason of his courage and capacity to the rank of lieutenant-general. During the Chinese-Japanese war in 1894 he was chief of staff of the 2d army, which took Port Arthur. He commanded the 12th (Kokura) division in the Russo-Japanese war.

INSANITY. Ohio reports the number of insane as 9,961, on Nov. 15, 1907, being a net increase of 235. Minnesota reported the number of her insane on July 31, 1908, as 4,560, a net increase of 181. California reported 6,232 insane, besides 327 patients on parole. Her normal increase has been 150 annually, but last year, ending June 30, 1908, brought her a net increase of 331. Iowa on June 30, 1908, reports a total of 4,069 insane in State hospitals, 798 in county almshouses, and 608 in private houses, in all 5,475. The net annual increase was 172. Secretary Butler of Indiana announces on Sep. 30, 1908, a total of 5,276 insane, of whom 4,236 were in State hospitals, 337 on parole, 542 in county poor houses, 43 in county jails, and 118 at their homes. Secretary Graves of Illinois reported on June 30, 1906, 9,326 patients in the State hospitals, and 2,234 in the county almshouses; a total of 11,560 insane. The annual increase in Illinois is 317. Commissioner Ferris of New York reported the number of committed insane in that State as 29,421, on Sep. 30, 1908, including 1,375 in the two hospitals for the criminal insane. There were also 1,035 in the private licensed houses, making a total of 30,456 registered cases in the State. Last year the total admissions reached 6,800, the net addition being 1,246, as against 715 of previous years. The overcrowding amounts to over 2,000 patients in the 15 hospitals, although increased accommodations provided during the year totaled 2,055 beds. Expecting a net increase of 1,200 patients during the present year, Ferris calculates that on Oct. 1, 1909, there will be a deficiency of 1,753 beds, in spite of the completion of constructions under way and planned. The Creedmoor Rifle Range was obtained as a site for a new hospital. Two new outing camps were used with good results during the summer. The chief matters of legislation secured were the act providing for the reception of voluntary cases into the State hospital, and that extending the possible parole of a recovering patient to six months. The per capita cost of maintenance was \$186.63. The rate of recovery based on admissions was 24 per cent.

The report of the commissioners in lunacy for England for 1907 shows a diminution in insanity in England and Wales. The total insane under certificate Jan. 1, 1908, was 126,084, due to an increase of 2,096. The report for Scotland shows 17,414 registered insane and 494 non-registered, on Jan. 1, 1908, making a total of 17,908. Of these, 2,633 were private, and 15,226 public cases, revealing a net increase of 293 for the year. The recovery rate for the year was 38.2 per cent. for private, and 40 per cent. in pauper cases. The per capita cost was

\$220.38. In Ireland the number on January 1, 1908, was 23,718, of whom 3,053 were in work-houses. The recovery rate was 38.6. The death rate was 7.7.

INSECTS. See ENTOMOLOGY.

INSECTS AND THE PROPAGATION OF DISEASE. The rôle played by the common house fly in the dissemination of disease assumes greater importance as the matter is more deeply studied. Diarrhœal disturbances and typhoid fever are most frequently carried, and a close relation between their prevalence and that of flies exists. Scarlet fever, tuberculosis, and diphtheria may be fly-borne. Newstead of the Liverpool School of Tropical Medicine reported an investigation into the habits of this household pest. Their breeding places were found to be in horse manure, or a mixture of this with cow dung, fermenting hops, ash pits containing fermenting vegetable matter, and all temporary collections of fermenting matter. Very dry or wet ashes or moist cow dung does not harbor them. When fowls, other than ducks and geese, were allowed freedom in yards, relatively few larvæ and pupæ were found. The avidity with which fowls devoured these latter proves their usefulness in keeping down the number of flies. Flies feed on moist decaying vegetable matter, manure, (animal and particularly human), straw mattresses, old cotton garments and sacks and waste paper, bread, and decayed fruits. The life cycle of the fly in all kinds of fermenting material is reduced to the minimum of ten to fourteen days, while in the absence of such artificial heat the cycle may take three to five weeks or longer, according to the temperature of the outside air. Excessively warm weather is not necessary for breeding. Various boards of health distributed literature warning the public against fly-borne diseases, and advising measures to discourage their spread. These measures consisted in prompt destruction of all waste animal or vegetable material, covering and disinfecting temporary and unavoidable collections of garbage, careful disposal of manure in stables, etc. People were instructed to keep food screened from flies at all times, to keep the sick protected from them, to screen all windows and doors, and to burn pyrethrum powder in the house. The part played by mosquitoes in the spread of malaria and yellow fever is now well known to the public. The facts in connection with the propagation of disease by the mosquito and the fly were concisely summarized in simple form in *Farmers Bulletin*, No. 155, U. S. Department of Agriculture (Washington, 1908), by Dr. L. O. Howard, under the title "How Insects Affect Health in Rural Districts." This deals particularly with the relation of mosquitoes to malaria and of flies to yellow fever and typhoid. The fly was also discussed in an important series of papers by C. Gordon Hewitt published in the *Quarterly Journal of Microscopical Science* on "The Structure, Development and Bionomics of the House Fly." The rôle of the flea in propagating the plague is noted under that heading. The connection between sleeping sickness and the tse-tse fly is noted under SLEEPING SICKNESS.

INSTITUTE OF AGRICULTURE. See AGRICULTURE.

INSURANCE. LIFE INSURANCE. Since the investigations of the Armstrong Committee of the New York Legislature in 1905-6, there has been such a flood of legislation throughout the

United States as almost to transform the insurance business. The New York State revised laws, framed under the direction of the above-named committee, were taken as models, but many States went considerably beyond them. Models were also drawn by a conference of governors, attorney-generals, and insurance commissioners in 1906. As a result New York State companies, beginning with 1908, were compelled to provide features in policies written in Illinois, Massachusetts, Michigan, Minnesota, New Jersey, North Dakota, and Tennessee that are not necessary in New York. In 1908 Texas carried restrictive legislation to such an extreme that 23 companies left the State. The feature of the Texas law most objected to was the requirement that three-fourths of the earnings in Texas be invested in that State. Louisiana provided for the organization of industrial, stock, and mutual life insurance companies in that State; and provided that failure on the part of fire insurance companies to settle claims within a certain time shall be punishable by a penalty of 12 per cent. of the loss. Ohio passed a comprehensive and efficient insurance law. South Carolina organized a new Insurance Department, with power to issue and revoke licenses to do an insurance business in the State.

On Feb. 3, Governor Hughes caused the publication of the report of Mathew C. Fleming, appointed to investigate charges against State Superintendent of Insurance Otto Kelsey. The report criticized the latter for failure to institute certain reforms, and for inaction in regard to certain abuses. The report itself was severely arraigned by President Charles A. Peabody of the Mutual Life Insurance Company on the ground that, in attempting to show incompetency and neglect of duty on the Superintendent's part, it used "insinuation with no specific charges," and in so doing reflected on the good name of his company. In December it was announced that Otto Kelsey, against whom as Superintendent of Insurance in New York Governor Hughes had made a stubborn but futile fight, at the expiration of his term of office had accepted an appointment as First Deputy State Comptroller, at an increased salary. See NEW YORK.

Early in the year the New York Attorney-General, Wm. S. Jackson, declared his intention of applying for a receivership for the Mutual Reserve Life Insurance Company on the ground of insolvency. Later a group of policy holders made such an application, and it was granted Feb. 16. Two months later the company was ordered dissolved, with two sets of receivers, appointed respectively by the State and Federal courts. In September a majority of the stock of the Washington Life Insurance Company of New York was acquired by the Pittsburg Life and Trust Company of Pennsylvania. A sensation was caused in insurance circles by the removal of the assets and records of the former company to Pittsburg during the night of Dec. 31, 1908. Steps were taken to compel the restoration of these documents to New York jurisdiction as a means of protecting the interests of policy holders. In August the sale of a majority of the stock of the Provident Savings Life Assurance Society brought about a reorganization in that company. A further change in control and in management followed

in October and in December respectively, the condition of the company being already much improved by the close of the year.

Two matters much discussed in insurance circles during the year were taxation of insurance company assets and revision of insurance laws. A report, published early in the year by President John M. Taylor of the Connecticut Mutual Life Insurance Company, showed that in 1906 the States had collected \$10,150,000 in taxes from 42 life insurance companies: this sum was equal to 26 per cent of the amount paid to policy holders. Such taxes greatly increase the cost of insurance, and reduce the numbers seeking its benefits, as well as the amount of these latter. Whether taxation is good policy is therefore a matter of concern not only to individual policy holders, but concerns also the public authorities, who must care for dependents. The zeal of insurance reformers has brought about a vast deal of restrictive legislation in the past two years. The companies have found that the existence of 46 separate authorities with different laws has greatly complicated the insurance business, and they are demanding either more liberal and uniform laws or legislation and supervision by the national government only. President Kingsley of the New York Life Insurance Company advocated speedy revision of the Armstrong laws of New York, especially those sections limiting the amount of reserve, prohibiting insurance of under average risks, and restricting the amount of expenses and of new business. President Ide of the Home Insurance Company enumerated certain requirements of the new laws which tend to cripple the business; among them were the requirement of uniform standard policies, uniform commissions to agents, limitations of investments, a cumbersome election method, limitation of new business, and the granting of extraordinary discretionary power to the insurance commissioner.

The condition of companies doing business in New York State on Dec. 31, 1907, and Dec. 31, 1908, was shown in reports issued by the State Superintendent of Insurance in Oct., 1908, and Jan., 1909. The insurance in force with the fifteen New York State companies at the close of 1907 was \$5,796,291,000, and at the close of 1908, \$5,629,721,000, as compared with \$6,152,317,000 in 1905 before the new insurance laws became effective. That in force with companies of other States doing business in New York rose from \$4,401,522,000 in 1905 to \$4,608,434,000 in 1907 and \$4,849,478,000 in 1908. The new laws by setting a limit to the amount of new business that may be written in any one year have greatly checked the growth of the New York State companies. Whereas there was a net annual gain in the amount of insurance in force in the several years preceding and including 1904 of \$473,000,000, there has been a net annual loss since then of \$18,000,000. Although the amount of new business written a few years ago was a billion of dollars annually, the amount in 1907 was only \$455,000,000 and in 1908 only \$465,000,000, or less than one-half the previous sums. This has brought it about that in each of the three largest companies of the State the amount of insurance terminated in 1907 and 1908 exceeded the amount of new business. This condition does not obtain, however, in the companies of other States, which reported terminated insurance of \$324,090,000 in 1907 and new business of \$568,592,-

000. These companies wrote \$595,390,000 new business in 1908. The total assets of companies doing business in New York State Jan. 1, 1908, were \$2,917,908,000, of which 57.7 per cent. was credited to New York companies. The liabilities were \$2,771,917,000, of which 59.4 per cent. were charged to New York companies. These included \$145,991,000 surplus and special funds. The gross income was \$629,629,000, of which 56 per cent. went to New York companies; of the total income \$485,632,000 came from policy premiums. Total disbursements were \$421,229,000. The terminated policies aggregated 443,379, or 8.33 per cent. of the total number, and \$862,529,000, or 8.4 per cent. of the total value. The proportions, as regards value, terminated by various causes were: by death, 14.8 per cent.; by maturity, 3.6 per cent.; by expiring, 14.4 per cent.; by surrender, 24.5 per cent.; by lapse, 35.7 per cent.; and by change, 7 per cent.

FIRE INSURANCE. The reports of the New York Superintendent of Insurance, covering 174 fire insurance companies doing business in that State in 1907, which include all the important companies of the United States and Canada, showed that they held assets valued at \$432,054,000 on Jan. 1, 1908. The amount of insurance in force was \$35,448,000,000. The amount written during the year was \$30,161,583,000, against which premiums aggregating \$352,702,000 were charged, or an average of \$1.02 for each \$1,000 of risk. The actual amount received in premiums was \$253,668,000, and the amount paid out on fire losses was \$117,772,000. Other disbursements included \$55,461,000 for commissions and \$18,406,000 for salaries, the total disbursements being \$246,566,000. In Jan., 1909, the Superintendent issued a preliminary report for 1908 showing a total fire loss in the United States and Canada of \$238,562,000 during the year, and an aggregate loss during the last six years of \$1,497,660,000, or one quarter billion dollars each year. A report of a committee of the National Board of Fire Underwriters shows that in the five years preceding 1908 the average annual per capita loss from fire in this country was 3.02 as against 33 cents in six European countries; in 252 American cities it was \$3.10, as against 61 cents in 30 European cities. The committee found that the number of fires per 1,000 of population in the American cities was 4.05 as against 0.86 in the European. The causes of these differences are found in (1) the responsibility of European tenants or landlords for fire loss to others caused through their negligence, and absence of such responsibility in America; (2) differences in building methods; (3) presence in Europe of many regulations with reference to explosive, inflammable, or dangerous materials, and their absence in America.

INTERNAL REVENUE. See LIQUORS, FERMENTED AND DISTILLED.

INTERNATIONAL ARBITRATION. International arbitration has ceased to be an academic question, and has entered the realm of practical politics and propaganda. During the past eighteen months the main issues raised for consideration have involved detail rather than principle. In the narrower sense of the phrase, meaning the submission by two or more nations of a difference or dispute to be determined by a disinterested third party, international arbitration is neither novel nor impractical. During

the 19th century no less than 195 international controversies were so settled, a number now increased to over 240, the United States being a party to more than 60, and Great Britain to more than 70. The term has been more broadly construed since 1899, the date of the First Hague Conference, to include the work of "mixed commissions" and "commissions of inquiry" as well as the development of international law expressed in international tribunals and courts. Notable achievements under these heads were the settlement of the Alaskan Boundary question by a mixed commission, and of the North Sea (Dogger Bank) incident by a commission of inquiry. During this later period 75 treaties of arbitration were negotiated (54 before the second Hague Conference in 1907) by the leading nations of the world, Great Britain being a party to 12; the United States, to 12;* Italy, to 8; France, to 10; Spain, to 14; Portugal, to 11; Denmark, to 8. (See *The American Journal of International Law*, Vol. II; 823.)

While some of these treaties exclude questions affecting "national honor," they nevertheless cover a broad field.

Two International treaties were ratified in 1902. The first, between Argentine Republic, Bolivia, Dominican Republic, Guatemala, Mexico, Paraguay, Peru, Salvador, and Uruguay, provided for the obligatory arbitration by The Hague tribunal of all disputes excepting those affecting national honor or independence. The other was between the same countries and the United States of America, Colombia, Costa Rica, Chile, Ecuador, Haiti, Honduras, and Nicaragua and provided for the reference of all pecuniary claims to The Hague. These two treaties, now in force and operation, provide a working basis for the leading powers of the Western hemisphere to adjust the bulk of their difficulties by a simple automatic reference to The Hague. Thus the principle of obligatory arbitration which was unanimously endorsed (except for Turkey and Japan) by all the governments represented in the Second Hague Conference is being worked out on a fairly broad and representative basis.

On Dec. 20, 1907, the Central American Peace Conference which had been in session in Washington concluded a treaty of peace and protocols, one of which provided for the establishment of a permanent court of justice to which the five nations (Costa Rica, Salvador, Honduras, Guatemala, and Nicaragua) bound themselves "to submit all controversies or questions which might arise among them, of whatsoever nature, and no matter what their origin may be, in case the respective departments of foreign affairs should not have been able to reach an understanding." This was carrying the idea of obligatory arbitration one degree further. The Court was duly installed May 25, 1908. (See *CENTRAL AMERICA*.) The establishment of this Central American Court lends additional interest to the growing discussion of the court of arbitral justice proposed by the Second Hague Conference.

* At the date of going to press the total number of treaties signed by the United States amounted to 16, being with Great Britain, France, Norway, Sweden, Spain, Portugal, Switzerland, Denmark, Italy, Mexico, Netherlands, Peru, China, Argentine Republic, Uruguay and Brazil.

Among the more important events of the past twelve months in the history of the movement for international arbitration are to be noted the agreement between France, Great Britain, Russia, Germany and Norway, guaranteeing the neutrality of Norway (q. v.); between Germany, France, Denmark, Great Britain, Netherlands and Sweden, to respect each other's territory on the North Sea (See *GERMANY*.); between Germany, Denmark, Russia, and Sweden, to respect each other's territory on the Baltic Sea. (See *GERMANY*.); the exchange of notes between Secretary Root and Ambassador Takahira relating to Far East; the agreement between United States and Great Britain to refer the Newfoundland Fisheries question to The Hague; and the creation of a Joint High Commission to settle future differences between United States and Canada, the latter not involving The Hague (See *CANADA*, and the *UNITED STATES*.), and between Germany and France—agreeing to arbitrate the Casablanca incident growing out of the flight of French soldiers to German soil. See *FRANCE* and *MOROCCO*, paragraphs on *History*.

There were a number of notable events during 1908 which have worked for the creation of a greater friendliness among the nations and for the creation of a sentiment in favor of international arbitration. Chief among these events are: The action of the United States, after open refusal of the Castro government in Venezuela to arbitrate, in refraining from the use of force to collect American claims; the fact that the Balkan crisis did not lead to war and seems likely to be composed without bloodshed; the decision of the British government to create an "International Hospitality Fund"—the first of its kind; the reception by the King and Queen of England of a deputation of the Universal Peace Congress in July, and governmental courtesies accorded the meeting of the Interparliamentary Union in Berlin; the exchange of visits between German and English editors, and the similar exchange between clergymen of the same countries; the international exchange of professors under which Nicholas Murray Butler and other eminent educators have lectured in foreign universities; and the cruise of the American fleet around the world, bringing the most distant parts of the earth into closer touch with the United States.

There has been an encouraging growth of public sentiment in favor of international arbitration on the part of business men and business organizations. The National Board of Trade views with satisfaction "the growing interest among business organizations and business men in the subject of international arbitration as a means of preventing recourse to arms amongst nations for the settlement of their misunderstandings and differences, and reaffirms its belief that the destruction of wealth and the human misery attendant upon warfare, may be greatly diminished by the extension of the method of arbitration in the settlement of disputes between nations." Moreover, the Board formally expressed its gratification at the treaties of arbitration, to which the United States is now a party, with a hope that further treaties of the same kind may be negotiated and that eventually their scope may be broadened, and expressed the hope that the United States government may find it expedient to initiate steps to bring about, by diplomatic negotiations, the

organization of the proposed International Court of Arbitral Justice.

The Committee on Business Organizations of the Mohonk Conference reported at the last meeting that with one exception all the organizations which were reported last year as having endorsed its circular, entitled "Why Business Men should Promote International Arbitration," have consented to become coöperating and corresponding organizations, and to these have been added 37 others, making a total of 166, representing 128 cities in 42 States and Canada. All of these organizations are leading or fairly prominent bodies, and few are in cities of less than twenty-five or thirty thousand inhabitants.

The colleges are also giving an increasing attention to the question. About two hundred may be said to give annual recognition to the subject. These include the large institutions like the Universities of California, Illinois, Chicago, Pennsylvania, and others. The College of the City of New York has established May 18th as "Arbitration Day," and given it a regular place in the college calendar. The Intercollegiate Peace Association also reports that its work is meeting with more than usual success. Along this line, it is interesting to note that the Association of Cosmopolitan Clubs, having chapters in 17 large American universities, made up mostly of foreign students with some Americans, at its last annual meeting allied itself with the arbitration movement.

The second Hague Conference unanimously adopted the following recommendation: "Finally, the conference recommends to the powers the assembly of a third peace conference, which might be held within a period corresponding to that which has elapsed since the preceding conference, at a date to be fixed by common agreement between the powers, and it calls their attention to the necessity of preparing the programme of this Third Conference a sufficient time in advance to insure its deliberations being conducted with the necessary authority and expedition.

"In order to attain this object the conference considers that it would be very desirable that, some two years before the probable date of the meeting, a preparatory committee should be charged by the governments with the task of collecting the various proposals to be submitted to the conference, of ascertaining what subjects are ripe for embodiment in an international regulation, and of preparing a program which the governments should decide upon in sufficient time to enable it to be carefully examined by the countries interested. The committee should further be intrusted with the task of proposing a system of organization and procedure for the conference itself."

Already the details of this Third Conference are coming to be discussed and the question is being asked with increasing frequency "Is the conference to be the first step to a confederation—that is to say, a political union of the States with legislative and executive powers—or is it an institution composed of the diplomatic representatives of the various countries with the power to legislate *ad referendum*."

THE MOHONK CONFERENCE ON INTERNATIONAL ARBITRATION continues to be a potent factor in its field. The Fourteenth Annual Conference in its platform especially approved and commended the work of the Second Hague Conference, "which,

revising and perfecting the various Conventions of the Conference of 1899, restricting the use of force in the collection of contract debts, proclaiming unanimously the principle of obligatory arbitration, establishing an international Court of Prize, and declaring in favor of the establishment of a permanent Court of Arbitral Justice, measured a great and welcomed advance towards the regulation of international relations upon the basis of justice, reason and respect for law." It also noted with pleasure the existence of the treaties of arbitration concluded within the past five years and more especially the arbitration treaties concluded between the United States and various nations, expressing "the hope that the peaceful and judicial settlement of international difficulties by resort to courts of arbitration and of justice bids fair to become the rule of the future as it has been in a measure the enlightened practice of the immediate past."

THE INTERPARLIAMENTARY UNION held its fifteenth annual conference at Berlin in Sept. 1908, Chancellor Prince Von Bülow welcomed the conference in his official capacity, declaring that "a rather long experience has convinced him that nothing is so well adapted to destroy misunderstanding as to become acquainted with one another through the development of personal relations."

THE INSTITUTE OF INTERNATIONAL LAW is composed of specialists in international law, selected from the nations at large. Its twenty-fourth session was held at Florence in Sept., 1908. The report of the Secretary, Professor Albéric Rolin, called attention to the order of business which dealt, in the domain of international law proper, with treaties of arbitration, defaulting states, occupation of territories, foreigners in belligerent service, and neutrality.

THE INTERNATIONAL LAW ASSOCIATION held its twenty-fifth session at Budapest in Sept. 1907. Among the subjects discussed were the question of blockade, the international prize court, and political offenses in extradition treaties.

THE AMERICAN SOCIETY OF INTERNATIONAL LAW, which was organized at Mohonk Lake, New York, in 1905, will hold its third annual meeting in Washington April 23 and 24, 1909. The tentative programme includes, among others, the following subjects: Arbitration as a judicial remedy; the nature and definition of political offenses in international extradition; the development of international law by judicial decisions in the United States; the constitution and powers which an international court of arbitral justice should possess. This Society publishes the *American Journal of International Law*, a most valuable and carefully edited publication. Its managing editor is Dr. James Brown Scott of the State Department, Washington, D. C.

THE NOBEL PRIZE for 1908 was divided Dec. 10 between K. P. Arnoldson of Sweden and M. F. Bajer of Denmark (q. v.). See NOBEL PRIZES.

THE SECOND NATIONAL PEACE CONGRESS will be held in Chicago May 3 to 5, 1909, the first having been held in New York, April 14 to 17, 1907. The coming Congress, in purpose and plan, will be similar to the New York Congress, its object being to strengthen public sentiment for international arbitration and the consideration of the next steps to be taken toward the realization of universal peace.

There are numerous local and sectional efforts to arouse interest in international arbitration. The Pennsylvania State Conference was held in Philadelphia last spring and was largely attended and very successful. Similar conferences are planned for the coming year.

The American Branch of the Association for International Conciliation has issued a number of valuable pamphlets, which in 1908 numbered among their writers Baron d'Estournelles de Constant, David Jayne Hill, James Brown Scott, George Trumbull Ladd, Elihu Root, Barrett Wendell, and others.

INTERNATIONAL CONGRESS OF AMERICANISTS. See ANTHROPOLOGY.

INTERNATIONAL FISHERIES CONGRESS. See FISHERIES.

INTERNATIONAL HIGHWAY CONGRESS. The First International Highway Congress, a very important event in the interests of good roads, was held in Paris during the summer of 1908. The congress devoted its time principally to the questions of the construction and maintenance of roads, the comparative study of different paving materials, the cost of laying and maintenance, and the resistance of pavements and roads to the modern methods of locomotion. An international exhibit of machinery used for the construction, maintenance, and cleaning of streets was displayed. See PAVEMENTS AND ROADS.

INTERNATIONAL INSTITUTE OF AGRICULTURE. See AGRICULTURE.

INTERNATIONAL LANGUAGE. At the end of 1907 the representatives of the DALI (Delegation for Adoption of an International Language), elected by ballot, met in Paris—Colonel Harvey, of the *North American Review*, being the representative of the United States—to decide as to the claims of the different international languages proposed. The year 1908 was filled with violent discussions regarding the report.

The principal languages examined were *Volapük*, *Idiom Neutral*, *Bolak*, *Esperanto*. The outcome was: "to adopt *en principe* Esperanto * * * on condition that certain modifications should be made to it by the 'permanent commission' of the DALI according to the indications given in the report of the Secretaries, and in following the recommendations of a project of reform by *Ido* (a pseudonym)."

The project, *Ido* claims, is not to propose a new language, but to render Esperanto, as now in use, both simpler and more consistent. The principal reforms are: to replace the accented letters like *ŝ ĝ ĉ* by more familiar signs, like *sh, gh, ch*;—special form for accusative dropped;—plural in *i* instead of *oj*;—conjugation of verbs considerably simplified;—the puzzling tables of correlatives, *tia, tio, tiu*, * * * *kia, kio, kiu*, * * * *kiam, kiom, kium*, dropped altogether;—vocabulary made more international (e. g., instead of 91 per cent. French stems and 19 per cent. German, have 83 per cent. French and 61 per cent. German). Dr. Zamenhof, the inventor of Esperanto, probably under strong pressure of his Lingus Komitato, refused to consider the changes.

The result is that war is on, in spite of the intervention of a Geneva committee which endeavored to bring about a reconciliation. (Esperantists resented especially the fact that

Ido is no one else but the greatest propagandist of Esperanto, Marquis de Beaufort.)

Esperantists have the advantage of the *situation acquise*; but the *Idists* seem to have good reasons on their side—at least Esperantists, having decided to study reforms for themselves, implicitly grant what is the contention of the *Idists*, that there is room for improvement.

Among the adherents of *Idism* are groups in Berlin, New York, London, Birmingham, Graz, Chartres, Verdun, Reims, Copenhagen, Stockholm, Zurich, etc. The organizers of the first and second congresses of Esperanto, in Boulogne and in Geneva, have joined the reformists. Many who fought bitterly *Idism* without knowing it have now adopted it. After the 4th congress of Esperantists in Dresden, 1908, fifteen groups of *Idists* were founded there. The most important adhesion, however, remains that of the famous linguist Espersen (who received in 1906 from the French Academy the 6,000 francs Prix Volney). For details on the discussion, see articles pro and con in *La Revue* (anc. *Revue des Revues*), Paris, Oct. 15, Nov. 15, and Jan. 1, 1908.

IOWA. One of the North Central Division of the United States. Its total area is 56,147 square miles. The population, according to Federal estimate made in 1908, was 2,196,970.

MINERAL PRODUCTION. The coal production of Iowa showed a steady increase in 1907 over the figures of the two years previous. In 1907 it was 7,574,332 short tons as against 7,266,224 short tons in 1906 and 6,798,609 short tons in 1905. The value of the output in 1907 was \$12,258,012 as compared with \$11,619,455 for the output in 1906 and \$10,586,381 for the output of 1905. The United States Geological Survey estimates the original coal supply of Iowa at 29,160,000,000 tons. Of this there had been mined from 1840 to the close of 1907 141,608,792 short tons. The coal fields of the State include an area of approximately 20,000 square miles, and are in the south-central and southwestern portion of the State. The coal-mining industry was affected but little in 1907 by the monetary disturbances which affected the production in other States. There were no labor troubles in the State during the year, and other conditions were satisfactory to the successful operation of the mines. The number of men employed in the coal mines of the State in 1907 was 15,585, as against 15,260 in 1906. There were in 1907 33 machines used for mining, as against 34 in 1906. There were 41 men killed in the mines of Iowa during the year. Clay products took an important part in the mineral production of the State. They were produced in 1907 to the value of \$3,728,785, as against \$3,469,027 in 1906. The products of stone were valued at \$499,416, of

which the limestone produced aggregated a value of \$493,815. Other mineral productions of the State are coal products, including coal tar, illuminating gas, and gas coke, zinc, lead, and mineral water. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$17,623,094, as compared with a value in 1906 of \$17,347,800. The production of coal in the State in 1908 is estimated to have been at least equal to if not in excess of that of the preceding year. Operations were suspended on April 1, pending the settlement of the wage scale; but this produced no great inconvenience.

AGRICULTURE AND STOCK RAISING. The acreage, production, and value of the principal farm crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 287,456,000 bushels, valued at \$149,477,000 from 9,068,000 acres; winter wheat, 3,108,000 bushels, valued at \$2,735,000 from 148,000 acres; spring wheat, 4,960,000 bushels, valued at \$4,365,000 from 320,000 acres; oats, 110,444,000 bushels, valued at \$46,386,000 from 4,545,000 acres; barley, 13,500,000 bushels, valued at \$6,885,000 from 500,000 acres; rye, 1,060,000 bushels, valued at \$678,000 from 53,000 acres; buckwheat, 140,000 bushels, valued at \$109,000 from 9,000 acres; flaxseed, 360,000 bushels, valued at \$396,000 from 33,000 acres; potatoes, 11,280,000 bushels, valued at \$6,758,000 from 141,000 acres; hay, 6,460,000 tons, valued at \$36,822,000 from 3,800,000 acres. The State ranks first in the production of oats. It also ranks first in the production of hay, surpassing New York, which up to 1908 occupied first place. In the production of corn Iowa is surpassed only by Illinois. The wheat crop has steadily decreased since 1900, being in 1908 but one-third that of 1900. The acreage planted in flax decreased from 126,453 in 1900 to 20,000 in 1907. The figures for 1908 show quite an increase. The acreage of hay from 1900 has decreased about one-fourth. The numbers of farm animals by thousands on Jan. 1, 1909, were as follows: Horses, 1,419,000; mules, 46,000; dairy cows, 1,586,000; other cattle, 3,842,000; sheep, 747,000; swine 7,908,000. The State ranks first in the number of swine and is surpassed only by Texas in the number of neat cattle, by New York in the number of dairy cows, and by Illinois in the number of horses. The wool clip for 1908 was valued at \$1,444,440. Poultry products form an important item in the yearly income.

MANUFACTURES. Industries carried on in factories showed an increase of 30.1 per cent. in capital, of 11.4 per cent. in the number of wage-earners, and of 20.8 per cent. in the value of products, from 1900 to 1905. The figures for 1905 were \$111,427,000, \$49,481, and \$160,572 respectively. The value of leading products, and, in parentheses, the per cent. of increase over the value in 1900, were: Slaughtering and meat packing, \$30,074,070 (17); cheese, butter, and condensed milk, \$15,028,326; flour and grist mill products, \$12,099,493 (9.9); printing and publishing, \$8,290,810 (34.9); railroad repair shops, \$7,618,721 (22.5); food preparations, \$6,934,724 (50.8); planing mill products, \$5,700,209 (7.6); lumber and timber products, \$5,610,772 (33.8 per cent. decrease); foundry and machine shop pro-

ducts, \$5,488,086 (23). Canning and preserving fruits and vegetables, and the manufacture of glucose and agricultural implements, are important industries. The cities credited with largest value in 1905 were: Cedar Rapids, \$16,279,700; Des Moines, \$15,084,900; Sioux City, \$14,760,700; Davenport, \$13,695,900; Ottumwa, \$10,374,100; and Dubuque, \$9,279,400.

FINANCE. The balance in the general revenue fund July 1, 1907, was \$872,877. The receipts for the fiscal year ending June 30, 1908, were \$3,663,154. The disbursements for the same period were \$3,891,842, leaving a balance July 1, 1908, of \$644,189. The principal sources of revenue were property, insurance companies, and inheritance tax, and the payments by the counties for the support of the insane. About 50 per cent. of the disbursements were for the State charitable and correctional institutions.

CHARITABLE AND CORRECTIONAL INSTITUTIONS. The average daily population of the State charitable and correctional institutions during the biennial period ending June 30, 1908, was as follows: College for the Blind, Vinton, 151.9; School for the Deaf, Council Bluffs, 244; Soldiers' Orphans' Home, Davenport, 497; Institutions for Feeble-Minded Children, Glenwood, 1039; Industrial School for Boys, Eldora, 440; Industrial School for Girls, Mitchellville, 219; Soldiers' Home, Marshalltown, 838; State hospitals for the insane, at Mount Pleasant, 1,048 insane and 23 female inebriates, at Independence, 1,115, at Clarinda 1,034, and at Cherokee 825; State Hospital for Inebriates at Knoxville, 129; State Penitentiary at Ft. Madison, 443; State Sanatorium for the treatment of tuberculosis at Oakdale, 27; the Reformatory at Anamosa, 354. The annual expenditure for all charitable and correctional institutions during the year 1907-8 was \$1,982,547.88.

POLITICS AND GOVERNMENT. A special session of the Legislature was called on Aug. 25th for the purpose of electing a Senator to succeed William B. Allison, whose death is noted below. On Feb. 18, the State Supreme Court handed down an important decision which upheld the constitutionality of the Des Moines Commission plan of municipal government. Under this plan the ward system is done away with, and in lieu of the Board of Aldermen all departments under the city administration are placed in the hands of a board of five councilmen, to be elected by the city at large. The plan was adopted at a special election held in 1907. Opponents of this plan took the matter to the Supreme Court on the ground that the denial of the right of the people to select their own aldermen by wards vitiated the principle of representative government. They held also that it placed the city in a class by itself rather than under the laws which the constitution declared should be uniform in their operations, and they contended further that it tended to merge legislative and judicial functions into a single body. Each one of these contentions was set aside by the court, and the city proceeded to elect councilmen to assume control of public offices under the new plan. On April 27, Attorney-General Byers ruled that a permit to issue stock could not be granted by the State Executive Council because the corporation purposed retailing intoxicating liquors. He declared that under the law there must be individual and not corporate responsi-

bility. In a previous opinion, rendered on Feb. 17th, Mr. Byers held that saloons could not lawfully be owned or controlled by corporations.

On Aug. 4, Senator William B. Allison (q. v.) died. For the account of his nomination at the State primaries and the election of his successor, see *Conventions and Elections* below.

CONVENTIONS AND ELECTIONS. Primary elections for the nomination of a United States Senator and for State officers were held on June 2. Senator Allison was a candidate for reelection and his strongest opponent was Gov. Albert B. Cummins. Senator Allison received a majority of about 10,000. B. F. Carroll was nominated for governor by the Republicans over Warren Garst by a majority of about 20,000. Fred E. White was the successful Democratic nominee for governor and Claude R. Porter for (U. S.) Senator. Senator Allison died, as noted above, on Aug. 4, and a special session of the Legislature was called to amend the primary law so that the people might again nominate a United States Senator at a primary election to be held on the day of the general election. It also, under the Constitution had to elect a Senator to fill the Allison vacancy. Gov. Cummins received 65 out of 83 votes necessary to elect, and the Legislature adjourned without electing a Senator. The Republican State Convention met at Des Moines on Mar. 18. A resolution was adopted by a vote of 672 to 510 urging the reelection of William B. Allison to the United States Senate. The adoption of this resolution developed the only contest of the convention. The platform adopted approved the readjustment of the rates of the tariff when conditions so changed that public interest demands their alteration. The delegates elected were instructed to vote for William H. Taft for President. The Democratic State Convention met on Mar. 26 at Des Moines. Resolutions favorable to William J. Bryan were adopted and the delegates were instructed to vote for him for President. It was said that Mr. Bryan prepared the platform, which was adopted. In the election on Nov. 3, the vote for national tickets was as follows: Taft, 275,210; Bryan, 200,771; Chafin, 9,837; Debs, 8,287. For governor, Carroll (Rep.) received 256,980 votes and White (Dem.) 194,129. The plurality of Gov. Cummins over John F. Lacey in the Senatorial primary was about 40,000 votes. Shortly after the election the Legislature convened in special session and elected Mr. Cummins United States Senator.

STATE OFFICERS: Governor, B. F. Carroll; Lieutenant-Governor, George W. Clarke; Secretary of State, W. C. Hayward; Treasurer, W. W. Morrow; Auditor, T. L. Bleakly; Attorney-General, H. W. Byers; Superintendent of Education, J. F. Riggs; Adjutant-General, Guy E. Logan—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Wm. D. Evans, Rep.; Judges, Scott M. Ladd, Emlen McClain, Rep.; John C. Sherwin, Rep.; Horace E. Deemer, Rep.; S. M. Weaver, Clerk, H. L. Bousquet, Rep.

The State Legislature of 1909 was composed of 34 Republicans and 16 Democrats in the Senate and 80 Republicans and 28 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES, under the section *Congress*.

IOWA, STATE UNIVERSITY OF. An institution of higher learning at Iowa City, Ia., founded in 1847. In 1908 the attendance was 2,360, distributed as follows: Literature and arts, 1,180; medicine, 354; applied science, 223; graduate college, 195; dentistry, 163; music, 67; pharmacy, 66; summer school for library training, 40. During 1907-8 the extension of the Hall of Engineering was erected at a cost of \$75,000, completing the first wing of the engineering quadrangle. A steam engineering laboratory has also been built at a cost of \$10,000. At the end of the year work was in progress on the new law building, to cost \$15,000. This will be completed in 1909. The faculty numbered 160, and the library contained 65,000 volumes.

IRON AND STEEL. The dependence of the commercial interests of the United States upon the iron and steel industry, and conversely the relation of this particular industry to general business conditions, is so direct and important that it is not difficult to realize that the financial panic of 1907 and the consequent depression should have called a halt in the march of prosperity and activity that in the previous five years had characterized all stages of this industry from mining to finished product. In 1908 there was curtailment of production and general depression all along the line, and this condition was also prevalent in Europe, where, for example, in Great Britain the output of pig iron suffered a decline of about 12 1-2 per cent., or from about 10,400,000 tons in 1907 to about 9,100,000 tons in 1908—yet it must be said that the latter figure was only exceeded in 1907. With the great depression in the United States must be considered a number of artificial influences which interfered with the natural course of the industry under such conditions, due largely to the position taken by the United States Steel Corporation, which has supreme power by virtue of its control of the major part of the American production from mine to finished article. The Steel Corporation decided that notwithstanding the falling off in demand, due to the general business depression, that there should be no reduction of prices or attempt to cut under the independent producers. Accordingly, as will be discussed later in this article it determined to maintain its prices resolutely.

But with this immense corporation were to be found a number of the largest independent producers working in harmony, so that in such times of depression, as 1908, as well as in the prosperity of the previous years, the market was steadied and prices maintained and controlled. The harmony thus manifested was complete and prices were maintained without break both by the United States Steel Corporation and the independents.

With the reestablishing of better business conditions toward the latter part of the year 1908, there came, following the presidential election (See *TARIFF*) the hearings on the proposed revision of the tariff, at which much contradictory and confused testimony was presented to the Ways and Means Committee. This investigation and the consideration of the iron and steel schedules of a bill to be introduced into Congress aroused a feeling of uncertainty not only in the industry, but among the business public at large, for while it was evident that reductions in rates could

be made without any serious damage to manufacturing interests, yet there was produced a feeling of doubt and hesitation that hindered the tendency toward healthy development for iron and steel products manifested at the end of the year. Summarizing conditions briefly before a more detailed consideration of the industry, it may be said that the iron ore production was the smallest since 1904, while the amount of pig iron produced was the smallest in eight years. But at the end of the year stocks of ore were believed to be smaller than in 1907, and with the expectation of increased business the various ore producing properties in the Lake Superior region, in the Southern States, and even in the less important fields, were being put in shape for increased demands for ore, while the plants themselves were being overhauled for future business.

The production of pig iron in the United States during 1908 amounted to 15,936,018 long tons, as compared with 25,781,361 long tons valued at \$529,958,000 in 1907, and 25,307,191 long tons valued at \$486,151,139 in 1906. The world's production of pig iron in 1907 amounted to 60,680,014 metric tons as indicated in the accompanying table, while in 1908 the total output was estimated at considerably less than 50,000,000 tons, due in large part to the decline in American production, and to a period of depression in Europe similar to that prevalent in the United States. Consequently, it is to be observed that the American output which in 1907 practically equaled that of the three next countries, Germany, Great Britain, and France, combined was only 4,000,000 tons in excess of that of Germany alone.

WORLD'S PRODUCTION OF PIG IRON.

Country	Pig Iron, Metric Tons	
	1907 (a)	1908 (b)
United States	26,193,863	15,800,000
Germany	13,045,766	11,800,000
Great Britain	10,082,638	9,000,000
France	3,588,949	3,450,000
Russia	2,768,220	2,850,000
Belgium	1,427,940	1,350,000
Austria-Hungary	1,405,000	1,500,000
Sweden	535,000	500,000
Canada	590,444	600,000
Spain	385,000	400,000
Italy	32,000	135,000
Japan		38,000
Other countries	625,000	100,000
Total	60,680,014	47,523,000

(b) Estimates of *Journal of Commerce and Commercial Bulletin*, Jan. 4, 1909.

PRODUCTION OF IRON ORE IN THE UNITED STATES. The decrease in the production of pig iron, as might be expected, has been accompanied by a proportionate falling off in the amount of ore mined, which has been general and confined to no particular region. The Lake Superior mines on the Marquette, Mich., Menominee and Gogebia in Michigan and Wisconsin, and the Vermillion and Mesabi in Minnesota ranges continue to be the chief sources of iron ore for American furnaces, as conditions of mining and lake transportation either with no rail haul in the case of the works on the lakes, or one of no great length in the case of the western Pennsylvania mills, together with the quality of the ore itself, make its use eminently desirable by the United States Steel Corporation, which has the largest interest in these mines. During

1908 the production from the Lake Superior mines was estimated at 25,927,000 long tons, as compared with the record output of 1907, 42,245,070 tons, and 38,522,239 tons in 1906. In spite of business conditions active preparations were being made for the future, especially in stripping and preparing for mining the ore-bearing lands of the United States Steel Corporation on the Mesabi Range in Minnesota, while in the Southern iron districts of Alabama, Tennessee, and Georgia the large companies were preparing to extend their operations, and in general to install improved methods and machinery. In such Eastern States as New York, old mines were reopened or put in readiness for operation, while some new mines were started. Almost everywhere it was recognized that a lower grade of ore could be used with profit.

According to the statistics of the United States Geological Survey the iron ore produced in the United States during 1907 amounted to 51,720,619 long tons, valued at \$131,996,147 at the mines. As compared with the production of 1906, the most productive previous year, this was an increase of 8.32 per cent. in tonnage and of 31.21 per cent. in value. The production of iron ore in the United States in 1906 and 1907, classified by States, was reported as follows:

PRODUCTION IRON ORE IN UNITED STATES.

State	1906		1907	
	Quantity long tons	Value	Quantity long tons	Value
Alabama	3,996,098	\$5,123,539	4,039,453	\$4,963,129
Arkansas and Texas	(a) 36,660	36,660	118,667	120,060
Colorado	14,078	22,525	11,714	21,085
Connecticut and Massachusetts	31,343	94,129	37,166	136,440
Georgia	411,230	734,780	444,114	837,102
Kent'ky, Maryland & West Virginia	46,940	58,175	62,808	95,891
Michigan	11,822,874	31,145,087	11,830,342	36,441,330
Minnesota	25,364,077	51,799,256	28,969,658	76,668,836

Virginia	828,081	1,579,817	786,856	1,538,920
Wisconsin	848,133	2,033,217	838,744	2,965,737
Total	47,749,728	\$100,597,106	51,720,619	\$131,996,147

(a) Production of Texas alone.
 b. Includes Iowa
 c. Includes California and Washington.

Of the iron ore production in 1907, 46,060,486 tons, or 89.1 per cent. of the total was red hematite. Brown ore amounted to 2,957,477 long tons or 5.7 per cent. magnetite made up 2,679,067 tons, or 5.2 per cent., while the quantity of carbonate used was but 23,589 tons. The average price per ton of brown ore in 1907 was \$1.81, ranging from \$3.67 in Connecticut and Massachusetts to \$1.01 in Arkansas and Texas. The average price for red hematite was \$2.63 with a maximum of \$3.24 in Wisconsin and a minimum \$1.06 in Kentucky, Maryland, and West Virginia. The average price for magnetite was \$2.03 and the average price of carbonate was \$1.74.

The decline in the industry, due to financial and business conditions during 1908, is reflected by the following table:

IRON ORE PRODUCTION OF THE UNITED STATES.			
	1907	1908	Changes.
	<i>Long tons</i>	<i>Long tons</i>	
Lake Superior.....	42,245,070	25,927,000	D. 16,318,070
Southern States.....	7,585,000	6,400,000	D. 1,185,000
Other States.....	3,125,000	1,875,000	D. 1,250,000
Total production.....	52,955,070	34,202,000	D. 18,753,070
Add imports.....	1,229,168	776,898	D. 452,270
Total supply.....	54,184,238	34,978,898	D. 19,205,340
Deduct exports.....	278,208	309,099	I. 30,891
Apparent consumption	53,906,030	34,669,799	D. 19,236,231

The chief imports of iron ore received into the United States came from Cuba and were sent to the furnaces of the Maryland Steel Company, near Baltimore, and other works on or near the coast. The exports of iron ore were mainly to Canada. The exports and imports of iron ore for the year ended December 31st were reported as follows, in long tons:

TOTAL PRODUCTION OF PIG IRON IN THE UNITED STATES IN 1907 AND 1908.

Statistics collected from the Manufacturers by the Iron and Steel Association (all in gross tons of 2,240 pounds).

States	Blast Furnaces Dec. 31, 1908			Production—Gross tons (Includes spiegeleisen, ferro-manganese, ferro-silicon, etc.)

(a) *Mineral Industry*. Vol. XVI.

(b) American Iron-Steel Association, Feb. 1, 1909.

	1907.	1908.	Changes.
Exports	278,608	309,099	I. 30,491
Imports	1,229,168	776,898	D. 452,270

Of the imports in 1908 Cuba furnished 579,608 tons. British North America 53,298 tons, and Europe 143,922 tons.

Imports of manganese ore were 209,021 tons in 1907, and 178,203 in 1908; a decrease of 30,818 tons.

PIG IRON. No two years could be selected to show greater changes or contrasts in the whole history of pig iron production than 1907 and 1908. From a high water mark in October, 1907, of a monthly output of 2,336,972 long tons of coke and anthracite pig iron it fell to 1,077,740 tons in February, 1908, and in round numbers the output for 1908 was but 62 per cent. of that of the previous year. This falling off of 38 per cent. in two consecutive years was the greatest ever known in the history of the industry and naturally was compared to that of 22 per cent. which took place in 1893 when there was a shrinkage from 9,157,000 tons in 1892 to 7,124,502 tons.

The total pig iron production for the United States in 1908 amounted to 15,936,018 long tons as compared with 25,781,361 tons in 1907, and 25,307,191 tons in 1906. This is shown in more detail by the accompanying tables which give the production by States and by kinds. The imports for 1908 were 92,202 tons, and the exports 46,696 tons, so that the apparent consumption was about 15,981,524 tons.

In the operation of blast furnaces there was a striking contrast between 1907 and 1908. On January 1st of the former year there were 340 furnaces in blast and 98 idle, and on June 30th

of that year, these figures became 360 and 82, respectively. With the change in business conditions many of the active furnaces were shut down, and on December 31st there were but 167 in blast out of a total of 443. This proportion was maintained during the first half of 1908, there being 168 furnaces in blast on June 30th, at which time, however, there were 24 new furnaces under construction and 17 being rebuilt. But conditions improved, and by the end of the year there were reported 236 furnaces out of 459 with a weekly capacity of about 400,000 tons in blast. This can be compared with the weekly capacity January 1, 1908, 235,152, and the high record weekly production of 528,170 tons, July 1, 1908.

STEEL. The total production of Bessemer-steel ingots and castings in the United States in 1908 was 6,116,755 long tons, as compared in 1907 with 11,667,549 tons, and 12,275,830 tons in 1906, which was the maximum ever recorded. The production of open-hearth steel ingots and direct castings was 7,780,872, 11,594,736 long tons in 1908, as compared with 13,897,627 tons in 1907, or a decrease of 32.6 per cent. In 1908 the proportion of basic open-hearth steel was 7,084,568 long tons, and of acid open-hearth steel 696,304 tons. In 1908 the total production of steel was 7,084,568 tons, or a reduction from 1907 of about nine million tons. The output

was divided into 6,116,755 tons of Bessemer steel, 7,780,872 tons of open-hearth steel, and 50,000 tons of other steels. The returns for finished products indicated the same falling off as in other branches of the industry on account of the industrial depression. This was especially marked in rails and track materials, as few railways were in the market for any but the most necessary materials for improvement or equipment, while on the other hand the demand for structural materials showed the least falling off, as during the times of prosperity necessary building had been retarded by high prices and labor troubles. The rail production in 1908 was 1,921,611 tons, against 3,633,654 tons in 1907, a decrease of over 47.1 per cent. The output was divided as follows:

State—Gross tons	Bessemer	Open-hearth	Iron	Total
Pennsylvania	315,563	177,461	..	493,024
Other States.....	1,038,673	389,843	71	1,428,587
Total for 1908...	1,354,236	567,304	71	1,921,611
Total for 1907...	3,380,025	252,704	925	3,633,654

The United States Steel Corporation, which is responsible for more than one-half of the output of finished products of iron and steel in the United States, published its report for the twelve months ending December 31st, which showed the following earnings:

UNITED STATES STEEL CORPORATION INCOME ACCOUNT FOR CALENDAR YEARS.

	1908	1907	1906
Total net earnings for year *.....	\$91,826,520	\$160,984,477	\$156,624,273
Deduct:

* Arrived at after deducting each month the cost of ordinary repairs, and maintenance of plants, employees' bonus funds, and interest on bonds and fixed charges of subsidiary companies.

The unfilled orders on hand December 31st, 1908, amounted to 3,603,527 tons, as compared with 3,421,977 tons on September 30th, and 4,624,563 tons on December 31st, 1907.

THE NEW GARY STEEL WORKS. The most important single event in the iron and steel industry was the approaching completion of the Gary Works of the Indiana Steel Company at Gary, Indiana, by far the greatest and best equipped steel plant in the world. The Indiana Steel Company was organized in January, 1906, as a constituent interest of The United States Steel Corporation, and practically unlimited capital was available for the construction of the new works, \$50,000,000 having been appropriated for its construction from 1905 to 1907. The total outlay for the new plant at the end of 1908 amounted to more than \$40,000,000, which was expended for ground, dredging harbor and water front, change of railroad right of way, and a number of other expenses made necessary by the immense character of the work, as well as for the plant itself with its machinery. Although the Indiana Steel Company nominally is a separate corporation, yet it is organized as a subsidiary of the Federal Steel

Company. Just as the Union Steel Company and Clairton Steel Company plants have been operated by the Carnegie Steel Company, so the operation of the Gary Plant was to be carried on under lease to the Illinois Steel Company. Now, in all previous steel works both in America and Europe, the design and construction of the plant represented an evolution and development, but here it was possible to locate and design at once a large plant without considering other elements than its profitable and economical operation. Consequently a site was selected in the Middle West 23 miles from Chicago as a suitable distributing centre to supply the great and growing trade of the Central West and Northwest, and on the shore of Lake Michigan where, along a water front of 1½ miles, ore could be landed direct from the largest vessels loaded at the mine ports in the North. Sufficient land (9,000 acres) was acquired not only for the plant itself, but for a future city to house the army of employees. Here the new plant was being erected and the various units have been united in a comprehensive scheme so that at every stage from beginning to end the production of steel will be facilitated and the

**THE WORLD'S GREATEST STEEL PLANT
THE NEW WORKS OF THE INDIANA STEEL COMPANY AT GARY, INDIANA**

maximum economy of production secured. This is largely secured by utilizing the gases from the blast furnace, especially in gas engines driving the blowers and connected with electric generators for the generation of electric power. (See GAS ENGINES.) Various mechanical and metallurgical processes have been developed with great advantage in American steel works, but for the first time all the best practice was collected in a single plant with due regard for economy of working. Thus there is provision for stocking 2,500,000 tons of iron ore, which would furnish a full supply not only for the winter months when lake navigation is impossible but would keep the entire plant in operation for six months. At the end of the year four of the 16 blast furnaces provided for in the plans had been completed, and two were put in blast in December.

Each blast furnace has a capacity of 500 tons of ore a day and the ore is unloaded mechanically and carried to storage bins from which it can be charged to the blast furnaces. Likewise extensive storage facilities are provided for coke, coal, and limestone, while a complete transportation system, amounting with the tracks of the classification freight yards to some 225 miles of track, completely connects every portion of the works, which are so arranged that there is no unnecessary handling of material. In addition to blast furnaces the works include open-hearth steel furnaces, rolling mills, and all necessary subsidiary machinery for the generation of power, repairs, and maintenance. The works are designed on what is known as the "unit" plan, so that future extensions can be made readily without interference with the construction already in use, while the arrangement is such that the material from one unit can be passed directly to the next department entirely by machinery, so that in the entire plant labor is reduced to a minimum. The main work of the blast furnaces will be to supply material for the open-hearth steel furnaces, and it is noteworthy that this type rather than the Bessemer furnace was adopted, as the product, especially in railway rails, seems to be more reliable, while the trend of structural steel material also seems to be from Bessemer to open-hearth. With the four open-hearth buildings completed at the end of the year the Gary plant will have a capacity of over 12,000 tons of steel a day, or 2,500,000 tons a year, which amount will be increased to 4,000,000 tons when all six furnaces projected are in operation. Each furnace is 40 feet long by 16 feet wide, and required 800,000 bricks for its construction. The furnaces, 84 in number, are to be supplied with gas from a producer, and are arranged in similar groups of 14, each group in a separate building, and having a daily capacity of 3,360 tons. The material next passes to the rail mill, where 4,000 tons of steel rails can be produced daily, or in normal operation 100,000 tons per month. The various rolls, shears, and presses are all driven by powerful electric motors, as is also the case in the billet mill, where the blooms are reduced to billets, and these in turn to small sections. Additional mills contemplated were a 60-inch universal plate mill, which would be the largest of its size in the world, and a 44x160-inch sheared plate mill, and later, among other additions, an axle mill, a structural mill, and vari-

ous sizes of merchant mills. The slag will be granulated and shipped to Buffington, a few miles distant, where it will be made into Portland cement by the Universal Portland Cement Company. Every facility is provided for loading the finished product for market directly on freight cars, or in case it is desired to ship, let us say, pig iron to other works of the Steel Corporation. Both in its design and size the Gary plant stands unique, and its operation will be watched with the greatest interest by the entire iron and steel industry of the world.

The year 1908 was not marked in the industry at large by any striking changes in metallurgy, though there was constant progress in the use of the Gayley dry air blast, which was found quite as advantageous when used with the Bessemer converter as in the blast furnace, where it was first applied with such success.

MARKETS. Such abnormal conditions due to the financial panic of October, 1907, and the consequent intense business depression resulted in 1908, that any consideration of the iron and steel markets for the year must reflect in large measure the general business situation with special features unique and solely appropriate to the iron industry. Thus, soon after the panic, in December, 1907, supervising committees were instituted by the large producers to regulate prices and to discuss the curtailment of production. While independent producers were represented in such a movement and were duly benefited, yet, as might have been expected, the influence of the United States Steel Corporation was paramount, and its Chairman, E. H. Gary, was largely responsible for a general policy whereby the producers stood together during what was unquestionably the greatest crisis through which the iron and steel industry had ever passed. The plan adopted was to maintain prices in spite of a lessened demand, and not to attempt any wholesale cutting or using the time to force out of business the weaker producers. At any event the understanding was maintained, and was loyally observed by all, so that from many the U. S. Steel Corporation received unstinted praise for conserving the best interests of the industry at large during troublesome times, just as it had done when the industry was at the height of its prosperity by the observance of due conservatism. On the other hand there were those who argued that a policy of freer concessions would have aided in the restoration of normal business conditions, as capital would have been encouraged in investing in various construction enterprises if cheap materials could have been secured on favorable terms.

As a contrast from steel and steel products, the market for pig iron ran a course more in harmony with the laws of supply and demand, and while it was demoralized and low prices prevailed for a large part of the year, the business done was limited. In June a readjustment of steel prices occurred and a reduction of from 10 to 15 per cent., or \$2 to \$4 a ton, in finished steel products was made, and while it improved business in certain lines to a small extent it was not sufficient to attract buyers in any large numbers. Possibly the worst showing of the year was made in steel rails, as the railway companies least of all were in a financial condition to make extensive contracts or purchases. In 1907 the output of rails of all kinds was

estimated at 3,633,654 gross tons, whereas in 1908 the total shipments against orders were unofficially estimated at about 1,600,000 tons. The price for standard sections remained during the year at \$28, and also was announced for the ensuing year, yet on light and rerolled rails there was considerable cutting of prices during the year.

EXPORTS AND IMPORTS. Exports of iron and steel, including machinery, from the United States for the year ending December 31st, amounted to \$151,113,114 in 1908, as against \$197,066,781 in 1907, a decrease of \$45,953,667, or 23.3 per cent.

The total quantities of iron and steel so far as reported were 964,266 tons in 1908, and 1,301,979 tons in 1907, a decrease of 377,703 tons. Imports of iron and steel, including machinery, into the United States for the year ending December 31st were valued at \$38,789,857 in 1907 and \$19,957,261 in 1908, a decrease of \$18,832,596, or 48.5 per cent.

The total imports of iron and steel so far as reported were 206,955 long tons in 1908, and 662,470 in 1907, a decrease of 455,575 tons, the greater part of which was in pig iron.

IRRIGATION. The great activity in the construction of irrigation works by both the government and private parties which had been so noticeable for several years continued during 1908.

RECLAMATION ACT. Government construction was done under the Reclamation Act (Act of June 17, 1902), which set aside for this purpose the net receipts from the sale of public lands, and provided for the repayment of the cost of the works built by the users of the water, the whole to constitute a revolving fund for the construction of irrigation works. The following table shows the projects undertaken under this law, the estimated cost, the estimated expenditures to Dec. 31, 1908, and the percentage of completion at that date:

PROGRESS OF PROJECTS under the Reclamation Act of 1902.

		2,292,346	89,431,500	42,083,800	

* This does not include the St. Mary Project, on which the estimated expenditure is \$257,000.

** The Leasburg diversion dam will furnish a temporary, intermittent supply to about 20,000 acres, which will be a portion of the Rio Grande Project and share in the benefits of the Eagle Dam.

Water was supplied to lands under some of the projects in 1908, but statements of the areas served are not available. It was estimated that water would be available during that season for about 500,000 acres, but the area actually served was not so great.

THE CAREY ACT. The greater part of the private construction of irrigation works was done under the Carey Act (Act of Aug. 18, 1894), which granted to each of the arid States 1,000,000 acres of desert land on condition of its reclamation. Congress, in 1908, increased the grants to Wyoming and Idaho, 1,000,000 acres each, these being the only States which had applied for the whole of the original grants. The following table shows the areas selected, approved, and patented under this law up to July 1, 1908:

WORK DONE UNDER CAREY ACT.

State	Selected	Relinquished etc.	Approved not patented	Approved and patented
	<i>Acres</i>	<i>Acres</i>	<i>Acres</i>	<i>Acres</i>
Colorado	50,807.94	5,704.95	54,102.99	
Idaho	1,180,566.17	265,828.94	662,254.00	156,964.90
Montana	104,587.98	2,792.53	83,498.54	18,296.91
Nevada	12,644.61	8,000.00		
Oregon	432,202.53	78,507.31	245,287.52	50,063.13
Utah	328,327.40	236,980.83	48,226.74	
Washington	155,549.39	155,649.39		
Wyoming	966,598.64	198,994.18	623,054.44	67,768.72

View showing the gates of the New Diversion Dam completely closed and the entire flow of the Truckee River diverted into the main Truckee Canal at the opening of the Truckee-Carson Project

The increases in the items for the fiscal year ending June 30, 1908, were: Selected, 1,471, 774.88; approved, but not patented, 600,249.89; patented, 175,590.83. The area selected during the year was 80 per cent. of the total previously selected; the area approved was more than fifty per cent. of the area previously approved, and the area patented was 1.5 times as great as the total previously patented showing that the activity under this law was much greater than ever before. The granting of additional areas to Idaho and Wyoming indicates an inclination on the part of Congress to increase the grants under this law to all the States, as the areas applied for reach the limit of the present grants. The act does not apply to the Territories, but its extension has been recommended by many.

AREAS IRRIGATED IN THE UNITED STATES. The following estimates of the total areas irrigated in the United States in 1908, and the area which can be irrigated, were collected in connection with the work of the Conservation Commission.

AREAS IRRIGATED IN ARID REGION OF THE UNITED STATES IN 1908.

State	Area irrigated	Area irrigable
	<i>Acres</i>	<i>Acres</i>
Arizona	200,000	1,000,000
Arkansas (rice)....	6,000	
California	1,800,000	\$
Colorado	1,852,900	2,893,900
Idaho	2,665,000	5,446,000
Kansas	50,000	\$
Louisiana (rice)....	310,000	
Montana	1,500,000	6,000,000
Nebraska	250,000	\$
Nevada	500,000	1,500,000
New Mexico	400,000	2,000,000
North Dakota	*64,300	1,540,000
Oregon	500,000	3,000,000
South Dakota	42,000	*191,900
Texas { General	500,000	
rice	284,000	
Utah	800,000	2,000,000
Washington	260,000	1,000,000
Wyoming	1,000,000	6,200,000
Total	13,185,700	

*Includes total under Reclamation Service ditches, 44,300 acres, much of which is not yet irrigated.

\$ State only partly arid. Area necessarily indefinite.

This table does not include the areas irrigated in the humid parts of the United States, where the artificial watering of truck and fruit crops is becoming very common. No estimates of the areas watered have been made, but it is considerable, especially in Florida and the other South Atlantic States and Gulf States, where winter crops are grown.

ISTHMIAN CANAL ZONE. See PANAMA CANAL.

ITALIAN EARTHQUAKE. See EARTHQUAKES.

ITALIAN SOMALILAND. A protectorate of Italy, on the eastern coast of Africa, extending from the Gulf of Aden to the equator. The Juba River divides it from British East Africa. Area, about 100,000 square miles; population, about 400,000. On the left bank of the Juba several land concessions of 5,000 hectares each, have been made to Italian capitalists and companies intending to pay special attention to cotton and tobacco culture. Wireless telegraph stations have been established, which are also connected with stations in British territory, in order to retain control of affairs during the monsoon period. The administration is in the hands

of a Royal Commissioner, in 1908 T. Carletti. In 1908, it was reported that the number of native soldiers, the Askaris, was to be increased to 3,500 in Benadir and southern Somaliland. For administrative purposes the protectorate is divided into three parts: (1) The Benadir Coast, extending from the mouth of the river Juba to 20° 30' N.; (2) the Sultanate of Obbia, from 2° 30' N. to 5° 33' N. and (3) the Sultanate of Mijertain, from 5° 33' to 8° 3' N. Obbia and Mijertain are under native sultans.

In Dec., 1907, there was some fighting between the Italians, aided by friendly natives, and Abyssinian raiders. In response to Italian protests, King Menelek punished the chiefs of the raiders. Attacks were made on caravans near Merka early in the year, and a small expedition was sent against the tribesmen. Fighting occurred in March with slight losses to the Italians, but with a loss to the tribesmen estimated at 400 to 500. The Italians seized and fortified Danane. The position of the Mad Mullah was reported in 1908 to be an unenviable one. The Sultans of Obbia and Mijertain were his enemies and his territory was exposed to bombardment from warships. In October, fighting was again reported between the Italians and the forces of the Mullah, but the tribesmen were defeated and quiet was soon restored. It was believed that the Mullah would ultimately have to submit to Italian rule.

By the convention of May 16, 1908, with Abyssinia, the boundary line of Italian Somaliland was defined as running from Dolo, at the confluence of the Dawa and Ganale Rivers, to Mekunna, on the Wabi Shebeli, in such wise that the Rohanuin tribe is to be in Italian territory, and the tribes to the north of it in Abyssinian. The western boundary is the Juba River from Dolo to its mouth. The entire territory of Ogaden is to remain Abyssinian.

ITALY. A kingdom of southern Europe. Area, 110,688 square miles. Population (1901), 32,475,253; estimated at the beginning of 1908, 33,909,776. The movement of population in 1907 was as follows: Marriages, 260,072; births, 1,062,333 (exclusive of 48,021 still-births); deaths, 700,333, giving an excess of 362,000 births over deaths. The emigration in 1907 to transoceanic countries was 415,901 (511,935 in 1906), and to European and Mediterranean countries, 288,774, giving a total of 704,675. The number of transoceanic emigrants who returned in 1907 was 222,319 (129,347 in 1906), of whom 162,980 were from the United States (96,210 in 1906), 42,076 from the La Plata States (22,041 in 1906), and 16,074 from Brazil (10,200 in 1906). The population of the principal communes in 1901 was: Rome, 462,783; Naples, 563,540; Milan, 491,460; Turin, 335,656; Palermo, 309,694; Genoa, 234,710; Florence, 205,589; Bologna, 152,009; Venice, 151,840; Messina, 149,778; Catania, 149,295.

AGRICULTURE. The division of the soil of Italy is estimated as follows, in acres: Arable land, 48,168,773; forests and woodland, 10,231,822; mountain pasture, 1,928,167; non-productive, 10,077,425. In the last twenty years there has been a gradual increase in the arable land through reclamation and clearing, and a much larger increase in the annual product. The wheat crop in 1908 was officially estimated at 150,792,000 bushels, representing a decline of 15 per cent. from the 1907 harvest, which

was 177,543,000 bushels, and about 10 per cent. from the average for 1901-1907 (166,934,000 bushels). The maize crop of 1906 was 93,103,000 bushels. The rice crop of 1908 was estimated at 25,000,000 bushels, the average for 1901-1905 having been 25,674,466 bushels. Since 1896, when the crop of rice fell as low as 10,669,957 bushels, there has been made considerable progress in irrigation, combating plant diseases, and selection of seed. During the first eight months of 1908 the export of rice was 28,941 metric tons, against 33,763 tons during the same period in 1907. The growth of industry in northern Italy and the consequent rise in the price of labor have resulted in the increased employment of agricultural machinery and increased output per acre. Thus in 1906 the maize acreage in the province of Milan was 673,780, and the yield, 20,620,070 bushels; in Venice, 705,862 acres and 17,861,911 bushels; and in the Mediterranean provinces, 878,417 acres and 8,373,638 bushels.

The area under vines in 1907 was 3,768,074 hectares (1 hectare=2.47 acres), against 3,778,800 in 1906 and an annual average of 4,074,000 during 1901-1905. The production of wine in 1907 was 53,900,000 hectolitres (1,423,876,300 gallons), against 29,800,000 in 1906 and an average of 38,200,000 in 1901-1905. The production of wine for 1908 was estimated at 46,850,000 hectolitres. The output for Sicily, included in the above, was 3,549,000 hectolitres in 1907, against 2,504,000 in 1906, and was estimated at 3,211,000 in 1908. A large part of the production of 1907 was still on hand at the end of 1908. The exportation of Italian wines is mainly to Switzerland, Central America, and South America. The area under olives in 1907 was 1,100,515 hectares, and the production of olive oil, 2,685,600 hectolitres, (70,945,000 gallons), against 1,100,500 hectolitres (29,072,000 gallons) in 1906. The prospects for the 1908 crop were reported poor. The output of lemons in Sicily and Calabria in 1907 was estimated at 6,900,000; the production of 1908 was expected to exceed this figure by 20 per cent. The production of cocoons in 1907 was estimated at 57,058,000 kilos (1 kilo=2½ lbs.). Deducting the large amount of cocoons used for reproductive purposes, the production of silk from the 1907 Italian cocoons was estimated at 4,820,000 kilos, besides 1,353,000 kilos of silk produced from imported cocoons. The total quantity of silk spun in 1907 thus amounted to about 6,173,000 kilos, against 6,047,000 kilos in 1906. Tobacco covered in 1906-7 12,444 acres, the production amounting to 14,494,000 pounds. The export of eggs, which had steadily increased during the past ten years, fell off considerably in 1907, owing to the competition of foreign countries. In the latter year it amounted to 22,877.9 metric tons, valued at 40,001,325 lire (1 lira=19.3 cents), against 33,142.8 tons and 56,342,760 lire in 1905, and 32,265.1 tons and 56,463,925 lire in 1906. The principal purchasers of Italian eggs are Switzerland, Great Britain, France, Germany, and Belgium.

MINING and MANUFACTURES. The total production of Italian mines in 1906 was valued at 92,718,000 lire; of the quarries, 48,086,000 lire. The production of sulphur in Sicily in 1907 was 403,000 metric tons, of which 334,014 were exported. Owing to the competition of Louisi-

ana sulphur, the Sicilian sulphur industry has been going through a crisis, the stock on hand at the end of 1907 being 576,377 tons. The production of the metallurgical establishments in 1906 was valued at 410,021,000 lire; of the chemical establishments, 102,325,000 lire. Northern Italy is rapidly becoming one of the great manufacturing centres of Europe, due mainly to the available enormous amount of water-power, estimated at 500,000 horse-power, which compensates for the lack of coal in the country. Italian and Swiss engineers are coöperating in the utilization of this water-power. Milan, Turin, and Genoa are the centres of manufacturing. At Legnano steam engines, turbines, and gas engines of the finest quality are turned out. The number of cotton spindles in the year ending Aug. 31, 1908, was 4,181,000, of which only 29,902 were reported running short time, and the mill consumption of cotton was 1,027,188 bales (702,659 American, 283,263 East Indian, 23,246 Egyptian). The number of spindles increased from 1,940,000 in 1900, and the mill consumption from 475,000 bales in 1900. The export of cotton goods, particularly yarn, showed a decided falling off in the first eight months of 1908 from the same period in 1907. There are 17 tobacco factories, the manufacture and sale of tobacco being a government monopoly. Almost all the tobacco consumed in the country is of home manufacture, but only about one-fourth is of home growth. Thus in 1906-7 the total consumption of tobacco was 47,785,000 pounds, of which 12,861,000 was of native, and 34,924,000 of foreign growth. About seven-eighths of the imports of leaf tobacco are American. The production, as well as importation, of beer is on the increase, the former having trebled in the last ten years. In 1906-7 the home production of beer was 359,921 hectolitres (1 hectolitre=26.4 U. S. gallons), and the importation, 100,453 hectolitres. The number of breweries in operation was 101, and the manufacturing tax was 5,295,000 lire. In 1907 there were built 26 ships of 85,370 tons. Ship-building showed a considerable decline in 1908, the gross tonnage on hand on Sept. 30 being 37,570, against 71,885 on Sept. 1, 1907.

FOREIGN COMMERCE. The special imports and exports of merchandise in 1907 amounted to 2,760,491,000 and 1,851,489,000 lire respectively, against 2,566,733,000 and 1,929,466,000 in 1906. The imports of precious metals in 1907 amounted to 168,143,000 lire; the exports, 5,811,000. The principal imports in 1906 were, in millions of lire: Cereals, 300.0; cotton, 245.3; raw silk, 232.0; coal, 214.9; machinery, 157.1; iron, 138.2; wood and timber, 97.3; hides and skins, 85.8; wool, 72.1; chemicals, 66.0; copper, brass, and bronze, 55.0; fish, 49.2; woollen tissues, 42.0; tools and instruments, 37.7; dyes and colors, 36.5; precious stones, 36.4; silk tissues, 36.0; articles of wood and straw, 33.9. The principal exports in 1906 were: Raw silk, 636.2; silk tissues 87.3; cotton tissues, 107.6; articles of wood and straw, 74.1; olive oil, 71.7; eggs, 56.5; hemp, 46.9; chemicals, 45.5; fruits, exclusive of almonds, 44.9; cheese, 38.5; wine, 36.1; hides and skins, 36.0; sulphur, 33.0; almonds, 26.1; marble and alabaster, 25.5; cotton yarn, 24.8; rice, 23.7; beans and peas, 23.3; zinc, 22.1; paper manufactures, 19.5; macaroni, etc., 19.3. The trade with the principal countries of origin and destination in 1906 is given on page 375

From and to	Exports	Imports
Great Britain	450.7	132.1
France	244.4	218.6
Switzerland	85.0	381.5
Austria-Hungary	227.7	139.4
Germany	398.1	256.6
Russia	193.5	10.5
Belgium	69.3	71.2
Rumania	86.4	6.1
Turkey	55.5	83.5
British India	119.1	22.6
China	80.5	3.1
Argentina	47.5	136.8
United States	311.3	240.7

COMMUNICATIONS. On Jan. 1, 1907, the merchant marine consisted of 513 steamers, of 497,537 tons, and 5,083 sailing vessels, of 503,260 tons. The length of railways in 1908 was 10,108 miles, of which 7,930 belonged to the State. The length of telegraph line in 1906 was 31,001 miles. In 1908 a law was adopted providing for the expenditure of \$107,000,000 during the next 16 years on the construction of 992 miles of new railways and the improvement of existing ones. The two largest appropriations—of \$29,000,000 each—are for the improvement of the direct lines between Florence and Bologna and between Genoa and Tortona; the improvement in the latter will shorten by 16 miles the distance from Milan to Genoa. In 1908 an English and a Swiss engineer received a concession from the Italian and Swiss governments for boring a tunnel through Mont Blanc. On the Italian side the tunnel will begin at Courmayeur, a town on the direct line to Turin; on the Swiss side, at Martigny, in the valley of the Rhone. The boring distance between the two places is 28 miles. The work was expected to last three years.

FINANCE. The revenue and expenditure in the fiscal year 1906-7 were 2,256,039,986 and 2,154,190,700 lire respectively. The budget for 1908-9 estimated the revenue at 2,128,936,549, and the expenditure at 2,085,322,791 lire. The principal estimates of revenue were: State property, including railways, 64,935,506; land tax, 83,280,000; house tax, 96,500,000; income tax, 247,900,000; inheritance taxes, 41,000,000; registration tax, 79,000,000; stamps, 70,000,000; customs, 290,000,000; octrois, 50,714,430; lottery, 74,000,000; tobacco monopoly, 254,000,000; salt monopoly, 80,000,000; excise, 145,400,000; posts and telegraphs, 121,260,000. The principal estimates of expenditure were, in lire: Interest on consolidated debt, 380,049,050, and on redeemable debt, 52,898,815; railway annuity, 24,906,004; floating debt (including railway guaranty of 79,919,253), 110,983,928; collection of taxes and management of monopolies, 232,183,419; justice, 50,968,142; public instruction, 85,671,715; police, 43,350,840; prisons, 337,065,580; public works, 127,867,730; posts and telegraphs, 128,175,421; army, 293,781,490; navy, 158,397,042. The total debt on July 1, 1908, stood at 493,965,852, of which 374,033,014 was consolidated.

ARMY. Military service is compulsory and universal, the army being organized into the First Line, or permanent army, the "mobile militia," corresponding to the Landwehr, and the territorial militia, corresponding to the Landsturm. The total period of service is 19 years, beginning at the age of 20. The young men of each year are divided into three classes: the first class goes to the permanent army; the second

class to the permanent army, but with "unlimited leave"; and the third, those exempted from military service for various reasons, to the territorial militia. There are 96 regiments of infantry; 24 regiments of cavalry; 24 regiments of field, 1 of horse, and 1 of mountain artillery; 3 regiments of fortress and 3 of coast artillery (72 companies in all); 5 regiments of engineers, and a railway battalion, in the permanent organization. There are also 22 battalions of Alpini or frontier troops, and the Carabinieri or military police force, recruited by selection from the permanent army. The actual peace strength of the army in 1908 was 236,000 men, although the authorized strength in the preceding year was about 285,000 men. The strength of the field army is about 400,000, and that of the Landwehr about 200,000. The reservists of all classes are estimated at 496,000, the mobile militia at 300,000, and the territorial militia at 2,285,000.

The Royal Military Committee on Reforms Needed in the Army in its report recommended the simplification of the complicated bureaucratic machine of the army, with a view to decentralization of the War Department, and giving the military commanders more power; a general increase in the army, and changes in the organization of the various corps. The pay of the officers was increased during the year, a new field uniform was adopted, and the number of exemptions from service was decreased. A large supply of new field artillery material was purchased from Krupp, and a volunteer cyclist and automobile corps was organized to assist in the national defence.

NAVY. The effective navy in 1908 consisted of 14 first class battleships, aggregating 180,090 tons; 2 second class battleships, 19,500 tons; 7 armored cruisers, 49,730 tons; 13 protected small cruisers, 34,400 tons; 9 gunboats, 6,740 tons; 13 destroyers, 4480 tons; 118 torpedo boats, 14,920 tons. Total, 176 ships, of 309,860 tons, besides 4 submarines. The crews numbered 29,000. The increase in 1907 was 19,540 tons. There were in construction 4 battleships, of 54,000 tons, and 4 armored cruisers, of 39,200 tons. The grand autumn manoeuvres were of much greater importance than those of previous years, owing to the principles involved. The general idea comprised: First, an invasion by sea; next, a disembarkation of troops; finally, a series of land operations. Powders are being developed which are more stable, and cause less corrosion. Captain Monni, Royal Italian Navy, claimed that the carbonic acid gas produced by the explosion of the powder takes from the steel of the gun the carbon necessary to form carbonic acid, thereby giving rise to corrosion. He proposes, therefore, to supply the necessary carbon by adding charcoal to smokeless powder during its manufacture. The resulting powder burns at a much lower temperature; and a small increase in the weight of the charge is necessary.

GOVERNMENT. King Vittorio Emanuele, born Nov. 11, 1869, succeeded his father on July 29, 1900. The cabinet at the end of 1908 included G. Giolitti, Premier and Minister of Interior; T. Tittoni, Foreign Affairs; V. E. Orlando, Justice and Ecclesiastical Affairs; P. Lacava, Finance; P. Carcano, Treasury; S. Casana, War; Admiral Carlo Mirabello, Navy; L. Rava, Public Instruction; P. Bertolini, Public Works; F. Cocco-Ortu, Agriculture, Industry, and Commerce; Dr. C. Schanzer, Posts and Telegraphs.

HISTORY.

THE MINISTRY. The Giolitti Ministry continued in office throughout the year 1908. In December, 1907, Signor Casana, though a civilian, was appointed Minister of War, the office having hitherto been filled by military men. The Chamber had shown itself unwilling to grant the moneys demanded by a military minister, believing that no account was taken in these demands of financial considerations but only of the military aspects of the case. Hence it was necessary to depart from precedent and select a civilian. Under Signor Casana the Army bill was put through in the course of the session, and the extraordinary supplies required for frontier fortifications were duly voted. Ex-Minister Nasi, against whom charges of corruption had caused much scandal in 1907, was found guilty by the Senate of the least serious charge that had been brought up against him, namely, peculation, and was condemned (Feb. 24) to eleven months' imprisonment, and four-and-a-half years' interdiction from holding office. There was much popular sympathy with him. He had admittedly used the public funds, but for his political advancement and not for private ends, and public opinion in Italy was not censorious in the matter, as appeared later in the year when in July he was re-elected Deputy for Trapani by a large majority, his programme being "Home Rule for Sicily."

THE STRIKE IN PARMA. Agrarian agitation caused an agricultural strike which was declared on May Day, involving, it was said, some 40,000 workmen. Both sides claimed successes, but both suffered severely from suspension of work. In June, largely owing to the efforts of the Church, arrangements were made for a meeting between the Agrarian Association, representing the landowners, and the Representatives of the Chamber of Labor for a discussion of terms of settlement. Toward the end of June some rioting occurred, but in the following month the strike died out from lack of funds. Meanwhile the working-classes had suffered severely. The Socialists who are strong among the agricultural workers of northern Italy, were the leading spirits in the Parma strike.

FOREIGN AFFAIRS. For an account of the fighting with the Abyssinians in the Benadir hinterland and the subsequent convention with Abyssinia, see **ABYSSINIA**. The fighting in Benadir came up for discussion in the Chamber and led to an inquiry as to the colonial policy. The explanation of the government's course by Signor Tittoni, Foreign Minister, was received with approval. Early in the year relations with Turkey became strained in consequence of the Porte's refusal to allow Italian post offices at Constantinople, Salonica, and elsewhere, in spite of treaty obligations. Italy also complained of obstacles that were placed in the way of her Tripoli coasting trade. The Italian fleet was mobilized at Gaeta on April 19, and thereupon the Porte agreed to Italy's demands on both these points. Signor Tittoni defined the government's attitude toward the matter of the Balkan railway (See **BALKAN QUESTION**) and convinced the Chamber that the ministry fully understood the question and would afford ample protection to Italian interests. As to Austria's annexation of Bosnia and Herzegovina, he admitted in the course of a debate in the first week in December that it was a matter that

concerned the signatories of the Treaty of Berlin. (See **AUSTRIA-HUNGARY**, concluding paragraph.) On Mar. 23, the German Emperor and Empress visited the King and Queen of Italy.

THE SCHOOL QUESTION IN PARLIAMENT. The question of religious instruction in schools gave rise to one of the important debates of the Parliamentary session. Signor Bissolati, a prominent Socialist deputy, brought in a motion for the secularization of the primary schools, excluding religious instruction in any form. By the Cassati law of 1859 religious instruction was required in the primary schools and parents who did not wish their children to receive it were obliged to prove that they received it at home. This law, however, was not applied in all the provinces, and in some it was not even promulgated. In 1870 a ministerial circular prescribed obligatory religious teaching in the primary schools of the communes, but only on condition that a certain number of parents demanded it. But the matter was left uncertain. On one occasion the Chamber voted that the communes might withhold religious instruction, and the law of 1877, modifying the Cassati law, did not mention religion among the obligatory subjects.

An unsettled point was whether the municipal authorities could refuse religious instruction when the parents demanded it. Opinions differed and the government was asked for a definite ruling. It finally decided that religious teaching should not be given except on demand of the parents and on approval of the municipal authorities, but if the majority of the Council disapproved, the parents were to have the right to have religious instruction given to their children by duly qualified teachers paid by themselves. The question assumed importance in party politics. Already in the preceding elections the Catholics had shown a tendency to unite against the extremists, especially against the Socialists. On the present issue they joined with the Conservatives in bringing evidence that the people were opposed to the suppression of religious instruction and that on the contrary they wished it generally enforced. Petitions with thousands of signatures were received from regions in which the Cassati law had never been promulgated. Deputies were asked to vote against both the Bissolati measure and the government's solution. On the other hand, the Socialists bestirred themselves in the name of freedom of conscience for the secularization of instruction. Their aim appeared to be the alignment of all the anti-clerical forces and ultimately the formation of an anti-clerical bloc, consisting of the hitherto discordant groups of the extreme Left. This, it was pointed out, would unite the Republicans and the Radicals and withdraw supporters of the ministry by appealing to their anti-clerical principles.

The spirit of such a programme, however, was alien to the tendency of Italian politics, and the ministry won an easy victory. Signor Giolitti declared his opposition to a policy which looked to the formation of an anti-clerical party with political persecution as its object, and adverted to its inconsistency with the customary tolerance of Italians in religious matters. Signor Rava, Minister of Public Instruction, demonstrated the liberality of the government's pro-

QUEEN ELENA OF ITALY

posals which left the pupils free, and did not compel them to receive teaching of which their parents disapproved. Nor were teachers required to give instruction that did not accord with their beliefs. Moreover, it left the communes free to decide the question as they chose and spared them a source of endless quarrel and debate in the administration of education. The Chamber rejected the Bissolati motion by a majority of over 150. The Catholics voted against it and also against the order of the day which would have signified approval of the government's solution.

OTHER EVENTS. Toward the end of May, the Woman's Congress began its session in Rome, the first meeting ever held in Italy. The Queen attended the opening meeting. Much comment in the newspapers was caused by an assault on some Scottish students near Rome in April. The trial was held at Arica and the verdict rendered on Oct. 21 found four of the accused guilty and sentenced them to six years' imprisonment. The Institute of Agriculture was opened by the King on May 23. The Papal decree reorganizing the Roman Curia and the Congregations went into effect June 1. Among other changes, it deprived the Congregations of the Propaganda of jurisdiction over Great Britain, Canada, the Netherlands, and the United States. For the great earthquake which visited Sicily and Calabria on Dec. 28, see EARTHQUAKES.

IVORY COAST. A French colony in West Africa. Its area is estimated at 120,000 square miles, and its population at 1,955,000. The seat of administration is at Bingerville, formerly called Adjame. The agricultural products are maize, plantains, bananas, pineapples, and other fruits. Coffee culture has been successfully introduced. The forests furnish mahogany, cocoanuts, palm oil, and rubber. Gold mining is assuming importance. In 1907 the imports and exports were valued at 12,103,616 and 10,243,816 francs respectively, the trade with France amounting to 2,925,000 francs of imports and 3,201,000 francs of exports. The exports are mainly rubber, palm-oil, and mahogany. The ports are visited by French, British, German, and Belgian ships. A railway is being constructed from Abijean inland; in 1908 it was 51 miles long. Telegraph lines connect the principal towns and extend to adjoining colonies. The administration is in the hands of a Lieutenant-Governor, who is under the Governor-General of French West Africa (q. v.).

JACKSON, HENRY. An American soldier, died on Dec. 9, 1908. He was born in Canterbury, England, on May 31, 1837, and obtained a commission in the British Army which he resigned in 1863 to come to America, where he enlisted as a private in the Federal army, was commissioned second lieutenant of volunteers in 1865 and first lieutenant the same year, was mustered out in 1866, and commissioned second lieutenant of cavalry in the regular army. He became first lieutenant in 1867, Captain in 1876, major in 1896, lieutenant-colonel in 1900 and colonel in 1901, retiring the same year. He was made brigadier general on the retired list in 1904 for Civil War service.

JAMAICA. A British island in the West Indies. Area, exclusive of its dependencies, 4,207 square miles; population (1907), 830,261, mostly negroes, mulattoes, Chinese, and East Indians. Kingston, the capital, had 46,542 inhabitants in

1891. The principal products and exports are bananas, which constitute about one-half the export, oranges, ginger, pimento, coffee, cacao, cocoanuts, sugar and rum, cotton, tobacco, and tea. The sugar output in 1907-8 was 13,000 tons; in 1908-9, 12,000 tons. The cotton production in 1907-8 was 6,250 pounds, against 19,080 pounds in 1906-7, and 88,133 pounds in 1905-6. The export of ginger in 1907-8 was about 1,400,000 pounds, the United States and Great Britain taking about 600,000 pounds each. The imports and exports in 1907-8 were valued at £2,914,013 and £2,376,202 respectively. The trade is chiefly with the United States, followed by Great Britain. There are 185 miles of railway and 889 miles of telegraph line. In 1907-8 the revenue was £1,021,937; the expenditure, £937,204; and the public debt, £3,736,690. The military garrison in 1907-8 was 1,061, besides the local forces. Attached to Jamaica are the Turks and Caicos Islands (q. v.), and the Cayman Islands. The latter have an area of 225 square miles and a population of 6,000. The Governor in 1908 was Sir Sydney Olivier.

Severe shocks of earthquake occurred on the morning of Jan. 3, 1908, at Savannah la Mar, and on the morning of the following day at Brownstown. Considerable damage was reported from Kingston and other places on the south shore. The Legislative Council was opened by the Governor in January. He referred to the fact that Kingston had been virtually rebuilt, and declared that it owed this quick recovery chiefly to those who had contributed to the relief fund. The year began with excellent financial prospects, and with a larger cash balance than at any time in recent years. In March the Council appropriated £100,000 as the first instalment of the insurance fund against future disasters. In December the policy holders who suffered from the earthquake and fire of the previous year held a meeting and unanimously decided to accept 85 per cent. of the face value of their policies, besides legal costs, which the insurance companies were understood to be willing to pay. The amount involved was fully £1,000,000.

JANSSEN, PETER. A German painter of historical subjects, died on Feb. 20, 1908. He was born at Düsseldorf, in 1844; learned the rudiments of art from his father, who was an engraver, and subsequently studied under Sohn and Bendemann at the Academy in his home town. In 1872 he executed a mural painting, "The Colonization of the Baltic Coast," for the Exchange at Bremen, which attracted widespread attention. He became professor at the Düsseldorf Academy in 1877 (director in 1895), and was elected a member of the Berlin Academy in 1885. Other notable mural paintings by him are the "Seven Momentous Episodes in the History of Erfurt" (1882), in the Town Hall at Erfurt, and "Human Life," "Imagination," "Beauty," and "Nature," in the Düsseldorf Academy. He also devoted considerable attention to oil painting. His "Walther Dodde and the Peasants of Berg" (now in the Düsseldorf Gallery) won the great gold medal in Berlin in 1893. The most notable example of his work in the United States is "Peter Denying Christ," in the Pennsylvania Academy of Fine Arts, at Philadelphia.

JAPAN. An insular empire of eastern Asia, consisting of Japan proper, Formosa (q. v.), the southern half of Sakhalin (q. v.), the protectorate of Korea (q. v.), and the lease of Kwantung

(q. v.). The area of Japan proper is 147,651 square miles. In 1903 the population numbered 46,732,876 (23,601,640 males and 23,131,236 females); in 1907 it was estimated at about 49,268,000. The number of foreigners at the end of 1906 was 19,129 (12,463 Chinese, 2181 British, 1,657 Americans, 686 Germans, 540 French, 254 Koreans, 231 Russians, 196 Portuguese, etc.). The population of the principal cities in 1903 was: Tokio, the capital, 1,818,655 (1906, 2,063,828); Osaka, 995,945; Kyoto, 380,568; Yokohama, 326,035; Nagoya, 288,639; Kobe, 285,002; Nagasaki, 152,293 (1907, 173,118); Hiroshima, 121,196; Sendai, 100,237. The population of Tokio increased 40 per cent. during the decade 1897-1906. The number of Ainos in Yezo, or Hokkaido, at the end of 1906, was 17,113. The immigration of Japanese into Hokkaido in 1906 was 66,793; their emigration from Hokkaido, 10,092.

FISHERIES. About one-tenth of the population is dependent for its livelihood on the fisheries. In 1908 the fishing fleet consisted of 74 steamers, 559 sailing vessels of European type, and 426,429 sailing vessels of native type. The number of vessels lost during the year was 949, and the number of lives lost was 1,230. The value of the catch in 1906 was \$27,227,574; of other sea products, such as fish oil, fish manure, shark fins, etc., \$16,704,554; of seals and sea otters taken by pelagic fishing vessels, \$12,450,000; giving a total value of \$56,382,128. There are about 20 whaling steamers. The number of whales captured in Japanese waters in 1907 was 806, against 268 in 1906, besides some 400 whales in Korean waters. The whaling industry has developed almost altogether since the Russo-Japanese war. The Hokkaido salmon fisheries have declined from about 120,000 koku (1 koku = 5.1 bushels) in 1888 to about 38,000 koku in 1907. Government hatcheries are to be established to remedy this condition.

MINING. The principal mineral products, in the order of their annual values, are coal, copper, petroleum, gold, silver, and iron. The output of coal in 1907 was 13,716,488 tons, of which 11,126,438 tons, or nearly 81 per cent., was mined on the island of Kiushiu. The bulk of the remainder came from Hokkaido. The copper production in 1906 was valued at 25,751,541 yen (1 yen = 49.8 cents). The production of pig lead in 1907 was 5,090,246 kin (1 kin = 1.323 lb.). The greater portion of the petroleum is obtained in the province of Echigo; in 1907 the production was about 470,000 barrels. This quantity is insufficient for domestic needs, and about \$7,500,000 worth has to be imported annually. The two largest petroleum companies in the Echigo province are the Japan and Takarada companies. The latter was established in 1893 with a capital of 15,000 yen, which increased through accumulation of profits and the absorption of 127 petty companies and guilds to 11,650,000 yen in 1908. The average rate of dividend for 16 years is stated to have been 38.4 per cent.

FORESTRY. Forests occupy 60 per cent. of the total area, or 55,000,000 acres, of which about 30,000,000 belong to the State, 5,000,000 to the Imperial household, and the rest to private persons or local corporations. The income from the State forests was estimated at nearly 13,000,000 yen in 1908-9, against 3,500,000 yen four years ago. In 1907 a law was adopted empowering the administrative authorities to take steps for the

preservation of forests, their replanting, and profitable working. In the past considerable grants of forest land were made from the holdings of the Imperial family to members of the new nobility, and from time to time the demand has been made that the State part with some of its forests and dispose of them to private persons.

AGRICULTURE. Six-tenths of the people are engaged in agriculture. Owing to the mountainous nature of the country, only about one-sixth of the total area is under cultivation, and individual holdings are mostly small, varying from one-half to ten acres. The implements are usually small and primitive, the irregularity and small size of the fields preventing the use of large machinery. Irrigation is carried on extensively, mostly by canals. The irrigation works are built by associations, and are under the control of a county or village official. The principal crops are rice and barley. In 1907 the rice crop was 49,052,065 koku (1 koku = 5.118 bushels); the estimate for 1908 was 53,536,412 koku—the highest in ten years. The increase is attributed not to exceptionally favorable climatic conditions, but to the extension of the area, due to higher prices. The barley crop in 1907 was 22,167,486 koku, against 20,365,445 in 1906. The area under wheat in 1906 was 1,085,839 acres, and the production, 24,699,440 bushels. The wheat production is not sufficient for the needs of the population, and there were imported in 1907 119,334,468 pounds of wheat and 162,729,996 pounds of wheat flour. Other important agricultural products, with their output in 1906, are, in bushels: Soy beans, 17,655,973; small red beans, 4,449,408; Italian millet, 11,478,386; millet, 18,006,247; buckwheat 5,970,319. The following are in pounds: Potatoes, 1,123,413,350; sweet potatoes, 6,304,297,620; radishes, the principal vegetable consumed in the country, 5,244,950,658; carrots, 196,574,083; burdock, 276,516,818; bamboo sprouts, 115,477,963; ginger, 48,770,327; cotton seed, 13,270,985; hemp, 22,127,924; leaf indigo, 58,804,502; leaf tobacco, 97,165,741; sugar cane, 1,455,043,119; paper mulberry (dried bark), 68,797,266; mitsumata (dried bark), 465,599,833; vegetable wax, 97,146,002; rush for matting, 92,635,059; dried menthol leaf, 20,774,156; peaches, 49,291,672; pears, 114,968,085; persimmons, 383,118,953; apples, 46,945,305; grapes, 20,467,495; oranges, 410,334,874; tea, 58,362,758. Tea, rice, and camphor are the only important agricultural exports. The area of tea plantations in 1907 was 125,727 acres. The export of tea in 1907 was 39,071,096 pounds—a decrease of 1,644,814 pounds from 1906. The camphor trade is a government monopoly. In the first eight months of 1908 the export of camphor was 1,938,000 pounds, valued at \$844,500, against 3,236,667 pounds, valued at \$2,030,000, in the same period in 1907. The fall in the price of camphor, as well as in the foreign demand for the Japanese product, is ascribed to the introduction of German artificial camphor and the entrance of China, Ceylon, and the Malay Peninsula into the market as competitors of Japan. The export of silk in 1907 was 9,273,090 catties (1 catty = 1.32 lbs.), valued at 116,429,000 yen; in 1908 down to Dec. 14, 9,958,000 catties, valued at 100,743,000 yen.

MANUFACTURES. In 1908 there were in Japan 1,550,929 cotton spindles, consuming during the year 878,178 bales of cotton, against 1,274,000 spindles and a consumption of 700,000 bales in 1900. In the spring of 1908 the condition of the cotton-spinning industry was very discouraging,

particularly since the increased capacity for production planned during the boom was becoming available just at the time when the supply of yarn exceeded the demand. The mill owners reduced production by 27½ per cent. for three months beginning with May 1; nevertheless they had large stores of unsalable yarn on hand. The Kanegafuchi and Fuji companies, whose last dividends were 22 and 25 per cent respectively, were expected to reduce their dividends to 10 per cent. Japanese mill owners ascribed the depression to the loss of a large part of the Chinese trade. According to them the sale of Japanese yarns in China fell from 277,135 bales in 1903 to 190,868 bales in 1907, while those of Indian yarns increased from 626,970 to 631,298 bales, and those of Chinese yarns increased from 170,000 to 321,675 bales. The comparison should, however, have been made with 1906—a year of prosperity, and according to the Chinese official returns, the imports of Japanese yarns in 1907 fell off by only 90,000 piculs, against a falling off in imports of Indian yarns of 200,000 piculs. (See CHINA, *Commerce*.) The imports of Japanese plain cotton fabrics into China in 1907 even showed an increase, having been 840,401 pieces, against 733,436 pieces in 1906.

Reduced production was also decided on, about the same time, by the three sugar refining companies of Japan. An agreement was signed, whereby the total annual production for domestic consumption was reduced to 225,000 bags (155,000 being assigned to the Dai Nihon Company, 45,000 to the Yokohama Company, and 25,000 to the Kobe Company), and a common office was established for fixing prices and making sales, though deliveries will be made direct from the refineries. The production for export was not limited.

Overproduction is also reported from the flour milling industry. Before the Russian War the domestic mills using machinery turned out annually about 1,500,000 sacks of flour. After the war the government raised the duty on flour to 30 per cent., while leaving the duty on wheat at 15 per cent. The result was that the industrial boom brought a number of large flour mills into existence, and the production was increased to 8,367,000 sacks. Adding the 2,300,000 sacks turned out annually by the old-fashioned water mills, there is an annual production of 10,700,000 sacks. The domestic consumption, on the other hand, is reckoned at 8,000,000 sacks, thus leaving an oversupply of 2,700,000 sacks. The mill owners contend that they cannot use the surplus for export, unless the government should give them a rebate of the duty on wheat.

The Wakamatsu iron foundry, a government enterprise, has been turning out pig iron since 1901, the iron ore coming from the Ta-yeh mines, China (q. v.). At present the output of pig iron is about 130,000 tons annually, and recent improvements and extensions have enabled the works to turn out rails, bar iron, locomotives, heavy guns for the army and navy, and materials for warships and other vessels. Owing, however, to the general business depression, work was greatly reduced in 1908. At the same time the government could not dismiss any of the 8,000 operatives, as they have been trained during a period of seven or eight years, and their skill represents an asset. According to a statement of the superintendent of the works, made in the early part of 1908, the foundry cannot at present produce iron as cheaply as it may be bought from

foreign countries, owing to the high price of coal and the fact that the ore has to be imported. The only hope, so far as he could see, lay in tariff revision, which would be possible in 1911.

The shipbuilding industry showed considerable growth in 1907 and in 1908 Japan was the only important shipbuilding country to have increased the tonnage under construction. On Sept. 30, 1908, the shipbuilding on hand was 97,580 gross tons, against 80,800 tons on the same date in 1907.

The capital invested in new enterprises and in extensions of old enterprises, from June, 1905, to May, 1908, is shown in the following table by groups of industries, in yen:

	Capital of new enterprises	Extension of capital
Banking	57,640,000	102,532,000
Spinning	37,603,000	52,605,000
Electric	138,580,000	39,760,000
Mining	92,720,000	20,000,000
Marine products	33,125,000	1,760,000
Railroads	348,804,000	119,469,000
Manufacturing	382,131,000	127,262,000
Navigating	44,000,000	14,900,000
Insurance	41,600,000	21,250,000
Commerce and others	157,653,000	16,453,000

Of this total, over 937,000,000 yen were invested in 1906 and nearly 675,000,000 in 1907.

FOREIGN COMMERCE. The imports and exports (merchandise only) of Japan in 1907 amounted to 494,467,000 and 432,413,000 yen respectively; in 1908 (preliminary returns), 435,687,000 and 376,796,000 yen respectively. The imports and exports of the precious metals in 1907 were 8,256,503 and 18,759,285 yen respectively. The principal imports in 1907 were, in yen: Cotton, 115,642,000; rice, 30,931,000; oil and bean cakes, 21,042,000; iron manufactures, 20,910; sugar, 19,865,000; cotton goods, 15,540,000; wool, 14,353; petroleum, 14,325,000; iron, 14,047,000; woollen goods, 10,934,000; beans, 10,026,000; wheat and wheat flour, 9,882,000; sulphate of ammonia, 8,227,000; indigo, 5,877,000; machinery, 5,736,000. The principal exports in 1907 were, in yen: Silk, 116,889,000; silk goods, 34,647,000; cotton yarns, 30,343,000; copper, 29,263,000; coal, 19,053,000; cotton manufactures, 14,490,000; tea, 11,756,000; matches, 9,44,000; pottery, 7,216,000; silk floss, 6,243,000; matting, 5,743,000; camphor, 5,027,000. The trade with the principal countries of origin and destination in 1907 was as follows, in yen:

From and to	Imports	Exports
Great Britain	116,245,000	22,443,000
France	7,025,000	42,533,000
Germany	47,668,000	11,256,000
Other European countries	24,275,000	18,134,000
Korea	16,372,000	32,792,000
China	67,992,000	106,020,000
Hongkong	821,000	24,386,000
French Indo-China	8,663,000	250,000
Dutch East Indies	22,039,000	2,261,000
British East Indies	74,593,000	13,088,000
Other Asiatic countries...	9,616,000	12,971,000
United States	80,697,000	131,101,000
Other countries	18,461,000	15,179,000

Direct Japanese exports to Russia amounted to only some 2,000,000 yen, but Japanese papers

state that exports *via* Great Britain, France, and Germany amounted to 60,944,000 yen.

COMMUNICATIONS. The number of ships entered in the foreign trade in 1907 was 15,831, of 20,336,695 tons. Of the tonnage, 8,867,436 was Japanese, 6,279,357 British, and 1,851,468 German. The merchant marine on Jan. 1, 1908, consisted of 2,139 steamers, of 1,115,880 tons; 4,728 modern sailing vessels, of 365,559 tons; and 20,263 native boats and junks, of 2,497,571 tons. The annual subsidies to the merchant marine to the end of 1909 amount to 13,190,695 yen. The total length of railway on March 31, 1907, was 4,805 miles, of which 3,114 miles belonged to the State and 1,691 miles to companies. The State lines showed during the year ended March 31, 1907, a net profit of 17,230,716 yen after paying working expenses; private lines, 21,166,602 yen. It is the government's policy to extend and improve the State railways so far as possible. The assignments in the budget for this purpose have been as follows: 1904-5, 8,900,000 yen; 1905-6, 1,820,000; 1906-7, 10,260,000; 1907-8, 29,593,000; 1908-9, 33,090,000; 1909-10, 30,180,000. The length of telegraph line in 1907 was 21,441 miles.

BANKS. The business depression which started in the latter part of 1907 was clearly reflected in the rapid contraction of the money deposited in the banks. In Jan., 1908, there were 2,140 banks and their branches throughout the empire, and the sums deposited in them amounted to 1,656,390,000 yen—a reduction of 64 million yen from Dec., 1907, and 160 million yen from Nov., 1907. On the other hand, the post office savings banks showed the usual increase in their deposits, which stood at 100,163,069 yen in June, 1908, against 80,783,195 in 1907, 58,560,428 in 1906, 45,869,225 in 1905, 34,140,826 in 1904, and 30,742,028 in 1903.

FINANCE. The revenue and expenditures in the fiscal year 1906-7, ending March 31, were 514,852,319 and 463,875,135 yen respectively. For 1907-8 the budget estimates were 616,455,343 and 616,441,047 yen respectively, and for 1908-9 they balanced at 619,797,671. The principal estimates of revenue for 1908-9 were, in yen: Land tax, 85,718,594; income tax, 27,571,513; licenses, 21,854,307; excise taxes, 113,190,064; customs duties, 41,410,920; other taxes, 9,852,385; stamps, 20,374,582; income from State enterprises and domains, 144,281,223 (posts and telegraphs, 38,585,597; forests, 12,963,854; monopolies, 52,978,553; railways, 37,054,470); total ordinary revenue, 475,737,999; extraordinary revenue, 144,059,672. The principal estimates of expenditure for 1908-9 were, in yen: Civil list, 3,000,000; public debt, 176,839,532; army, 107,416,773; navy, 80,961,592; public instruction, 6,013,351; justice, 11,623,273; agriculture and commerce, 17,489,187; communications, 85,036,874. The public debt stood on March 31, 1908, at 2,276,346,452 yen, consisting of 1,110,645,228 yen for the internal debt and 1,165,701,224 yen for the external debt.

ARMY. Military service is universal and compulsory, liability commencing at 17, actual service at 20, and ending at 40 years of age. All those capable of bearing arms are divided into two classes, known as the "absolutely fit" and the "fit," the annual contingent fixed by Imperial decree for the active army being selected entirely from the "absolutely fit" by drawing lots. The period of service is divided as follows: 2 years for infantry, and 3 for other arms, in the first line of active army (Geneki); 5½ years

(or 4½) in the active army reserve (Yobi), with 60-day periods of training; 10 years in the second line (Kobi), corresponding to the German Landwehr, with two 60-day training periods; 2½ years in the territorial or home defense army (Kokumin), corresponding to the German Landsturm, which completes their 20 years' service. The supplementary (Ersatz) reserve for making good the waste of war is called the Hoju, and consists of the "absolutely fit" not required by the annual contingent for the first line, and of as many of the "fit" as are needed to make up the authorized strength.

The reorganization under the law of 1907 was proceeding satisfactorily, and the scheme was to be completed in 20 years. The division is the highest unit in the army, and there are 18 line and 1 guard divisions in service, in addition to a considerable number of independent troops, such as 2 brigades cavalry, 3 brigades field artillery, 3 battalions mountain artillery, 6 regiments of heavy artillery, 1 brigade communications troops, 1 regiment railway troops, 1 telegraph battalion, etc.

The annual contingent for the active army varies greatly; it was 17,000 men in 1888 and 120,000 in 1906, this latter contingent entering the service in December, 1907, and having been mobilized in 1908. The number of men reaching the age of 20 in 1907 was 520,000, which were assigned as follows: 120,000 for the Geneki, 62,000 for the Hoju, 104,000 for the second part of the Kokumin, 52,000 excused for family or professional reasons, and 182,000 exemptions. A résumé of the military forces gives the following figures: Fully instructed men, 1,638,000; of whom 742,800 belong to the active army and its reserve, 780,000 to the reserve army (Kobi), and 115,200 to the Kokumin, 1st part: partly instructed men 846,300; reserve strength of men available but not instructed, about 3,000,000. The actual number of men with the colors in 1908 was about 220,000, and this army when sent into the field for active service would number 570,000. Constant improvements were being made in material and training, there having been no respite after the war with Russia. The Japanese in 1908 adopted a new fuse for the field gun; began the issue of the Arisaka rifle to the troops; completed arrangements to construct all war material in home factories; and held important manœuvres, which were characterized by exact and precise reconnaissance of the hostile positions, skilful choice of defensive positions, handling of reserves, and use of machine guns.

NAVY. In 1908 the navy consisted of 18 first class battleships, aggregating 194,110 tons; 2 second class battleships, 17,150 tons; 2 armored coast defense vessels, 8,400 tons; 14 armored cruisers, 142,000 tons; 3 protected large cruisers, 18,370 tons; 18 protected small cruisers, 54,230 tons; 7 unprotected small cruisers, 11,050 tons; 54 destroyers, 20,568 tons; 18 torpedo boats, 2,700 tons. Total 131 ships, of 468,578 tons, besides 7 submarines. The crews numbered 39,712. The increase in tonnage in 1907 was 44,098 tons. There were under construction 3 battleships, of 60,800 tons, and 6 armored cruisers, of 95,800 tons, besides minor craft. The armament of the *Aki* and *Satsuma* was changed, in November, to 10-12", 50 cal.; and 24 R. F. guns, probably 10-6", and 14-4.7". It was previously believed that they were to have 4-12", and 12-10" guns. In the autumn manœuvres, the fleet was divided into three divi-

sions, the first representing a Japanese squadron; and the other two, attacking forces. The attacking forces had their base in the south of Formosa; and attempted to blockade the Sasebo naval station, and the Korean channel. Operations commenced about the middle of October; and a decisive battle was to be fought off Sasebo on or about Nov. 15th. After the exercises, the Emperor reviewed the whole fleet at Kōbe. The total tonnage of the 144 units engaged was said to have been about 400,000.

GOVERNMENT. The Emperor Mutsuhito, born Nov. 3, 1852, succeeded his father Feb. 13, 1867. The cabinet at the end of 1908 consisted of Premier and Finance Minister, Marquis Katsura; Foreign Affairs, Baron Komura; Interior, Baron Hirata; War, General Viscount Terauchi; Navy, Vice-Admiral Baron Saito; Justice, Viscount Okabe; Education, G. Komatsubara; Agriculture and Commerce, Baron Oura; Communications, Baron Goto.

HISTORY.

The opening of the year 1908 found the foreign relations of Japan in a satisfactory condition. The alliance with Great Britain had been renewed. With France and Russia *ententes* had been established, in which the participating Powers reciprocally guaranteed their territorial possessions in eastern Asia. In course of the year this chain of alliances and *ententes*, all aiming at the maintenance of the *status quo* in eastern Asia and the open door in China, was further strengthened by the agreement of the United States with Japan (for which see *UNITED STATES, History*). Other leading events in Japan's foreign relations during 1908 were the controversies with China over the capture of the Japanese trading vessel *Tatsu Maru*, the consequent boycott of Japanese goods by Chinese merchants, and the proposed extension of the Chinese railway from Hsinmintun northwards to Fakumen; and the negotiations with the United States and Canada in regard to the regulation and restriction of Japanese emigration to these countries. The first three of these questions are treated under the history of CHINA, and the last two, respectively, under the history of the UNITED STATES and CANADA. The reception accorded by the Japanese government and people to the American fleet on its cruise around the world is also described under the history of the UNITED STATES. We shall therefore confine ourselves here to an account of the leading events in Japanese internal politics during 1908, excepting, however the important statement concerning the Japanese government's policy in respect of emigration, made to the Diet on Jan. 28 by Count Hayashi, then Minister of Foreign Affairs.

BARON HAYASHI ON EMIGRATION. The Minister of Foreign Affairs began with the explanation that the danger had long been recognized of allowing Japanese laborers to flock in unrestricted numbers to the American Continent in the face of the attitude of the labor unions. The emigration law of 1896, which gave the government full power to regulate labor emigration in the interests of the international relations of the Empire, was adopted in recognition of that danger. The government had accordingly issued regulations, but these had lately proven inadequate, as the emigrants, in violation of their passports giving them admission to Hawaii, made these islands a stepping stone for passing to the United States. The lat-

ter adopted in March, 1907, legislation against the admission of Japanese emigrants coming *via* Hawaii, and the stream of emigrants was thereupon diverted to Canada. The Japanese consuls in Canada made numerous appeals to their government to restrict the inflow, which would lead to complications with Canada, as well as to great suffering among the immigrants themselves. After the Vancouver riot, with which the Canadian government dealt in a spirit most friendly to Japan, the former proposed to the Japanese government to negotiate a treaty for limiting labor emigration to her shores. The Japanese government replied that it could not possibly negotiate a treaty differentiating injuriously against its own nationals. Nevertheless Canada sent Mr. Lemieux to try to negotiate such a convention. This was declined, but the Canadian envoy received assurances from the Japanese government that it would continue to exercise all functions delegated to it by law in this matter. It was thereupon agreed that no restriction whatever should be imposed on the following classes of emigrants, namely: travellers, merchants, and students; Japanese laborers who had their wives and families in Canada; laborers who had returned to Japan with the intention of going back to Canada; contract laborers, that is to say, men having fixed employment; Japanese subjects discharging the duties of domestic servants and accompanying their employers; and lastly, agricultural laborers. Obviously the only emigrants not included in the above categories were those who drifted into Canada without any resources of their own, on the chance of finding employment. The Japanese government had been frequently urged by its own consuls to check the emigration of such men. As for the prohibition just imposed on the emigration of laborers to Hawaii, this was due to the fact that the number of Japanese laborers on those islands had come to be in excess of the local demand since their exodus to the United States and Canada had been checked. The Japanese in Hawaii had themselves petitioned their government to impose this prohibition.

FINANCIAL DIFFICULTIES. The Russo-Japanese War had left to Japan a legacy of heavy taxes, which had to be continued in order to maintain the army and navy on the new and much expanded basis. These taxes were not felt to be oppressive during the prosperity following immediately after the war. But with the setting in of the commercial depression towards the end of 1907, the commercial classes began to raise their voices against the ever-increasing unproductive expenditures and the consequent proposals for new taxation. The presentation of the budget synopsis for the current year, as well as the following one, in the Lower House of the Diet on Jan. 16, 1908, precipitated a most violent opposition in the country, in the Diet, and even in the cabinet itself. According to the budget, the available revenue for the two years was expected to fall below the proposed expenditures by 40,000,000 yen, and the deficit was to be made good from new taxation. The dissensions in the cabinet resulted in the resignation of the Ministers of Finance and Communications. Marquis Saionji tendered his resignation to the emperor, but it was refused. Meetings of protest were held in Tokio by delegates from the chambers of commerce throughout the country, in which lack of confidence was ex-

pressed in the Ministry, the Diet, and all existing political parties, and the business elements were urged to set up their own candidates in the approaching general election, since not otherwise could their views obtain proper representation. The last meeting of the United Chambers of Commerce, held in Tokio on Feb. 14, adopted a very strong resolution, unreservedly condemning the government, not only for having refused to abolish the salt monopoly and the taxes on textile manufactures and railway journeys, but also for having imposed further burdens on the people. The meeting declared itself against excessive armaments and unproductive expenditures, and called on the Chambers of Commerce throughout the Empire to unite their strength in order to oust from the Lower House of the Diet all politicians who had voted for the government's programme, and to replace them by men who would advocate sound, economic principles.

Besides their opposition to the above-mentioned three taxes, strong objections were also raised to the government's proposal for a progressive income tax, according to which the wealth of individuals would be taxed three or four times as much as that of corporations. This arrangement, it was said, would leave an opening for the escape of very rich men and would press most heavily on the middle classes and the landed interests. The demand of the commercial classes for greater economy in unproductive expenditures also found expression in the early part of May in a representation made in the House of Representatives and signed by no less than 342 members, out of a total membership of 379, thus representing practically every shade of political opinion, in which the government was urged to remove the State railways from the general budget and place them under a separate account, so that the profits derived from them might be devoted in their entirety to the development of the means of communication which the country stood so much in need of.

GENERAL ELECTION. In preparation for the general election to the House of Representatives, to be held on May 15, each of the three principal political parties issued in the early part of April a manifesto to the electors. The Progressists attacked the government on the ground that an equilibrium was not maintained between the resources of the nation and its unproductive expenditures, and laid on it the blame for the lack of confidence manifested by foreign nations in Japan's policy as regards the open door in Manchuria and Korea. The Seiyu-kai, the most numerous party in the House of Representatives, from among whom the cabinet of Marquis Saionji was composed, retorted by charging the Progressists with lack of fixed principles, in view of the fact that in the 23rd session of the Diet they had advocated a positive policy and had endorsed large expenditures, whereas in the 24th session they assumed a negative demeanor and opposed even small expenditures. Their sole object, said the Seiyu-kai, was the overthrow of the Saionji cabinet. The manifesto of the Daido Club, the third party in the House of Representatives and generally representing the views of the House of Peers, was chiefly apologetic in tone, denying the often heard accusation that it was a party without fixed principles and was acting merely in obedience to opportunist motives. About the

middle of April, the chief of the police bureau in the Home Department issued strict instructions to the police to check all forms of corruption and bribery in the coming general election. A private bill had been introduced in the last session of the Diet, limiting the legitimate expenses of a candidate to 2000 yen in a rural constituency and 1000 yen in an urban one. The government opposed the bill, on the ground that the principle of expenditure in elections ought not to be recognized by law. Nevertheless, the introduction of such a bill showed that the members were cognizant of the existence of corrupt practices, and the chief of the police bureau was particularly severe on the "election brokers," who make a business of collecting promises to vote and selling them *en bloc* to candidates.

The results of the election were as follows: The Seiyu-kai elected 189 members, a gain of 8 over their strength in the last Diet. The Progressists elected 77, a loss of 12. The Daido Club elected 32, a loss of 96. The Yuko-kai elected 27, a loss of 10. The unattached, or Independents, numbered 53, against 14 in the last diet, a gain of 39. The two most prominent features of the result were, first, that for the first time since the establishment of the Diet, one party—the Seiyu-kai—elected an absolute majority of the members; and, secondly, the great increase in the number of members unattached to any of the existing political parties. On closer scrutiny, moreover, it was found that all existing parties had lost seats in the urban districts, their total loss of 20 members in these districts corresponding to a gain of 20 in the ranks of the Independents, while in the rural districts the Seiyu-kai gained 13 members, all the other parties lost—the Daido Club as many as 19—and the Independents gained 19. The uniform loss of the old parties in the urban constituencies and the corresponding gain of the Independents thus showed that the agitation of the Chambers of Commerce against increased unproductive expenditures and taxation had borne fruit. Another notable feature of the result was that only 159 old members were reelected, while 181 were wholly new men, and 29 had been members of earlier Diets. This feature also appears to indicate that the policy of the last Diet was generally unpopular.

CHANGE OF CABINETS. The overwhelming triumph of the Seiyu-kai in the general election, the fact that for the first time a Japanese political party controlled a majority of the Lower House of the Diet, inspired the friends of constitutional progress in Japan with new hopes. The Constitution gives the Emperor the authority to select his Cabinet, who are responsible only to him, and cabinets had been hitherto selected without reference to the composition of the elective branch of the Diet. This may be said to have been the unavoidable result of the fact that no party controlled a majority of the delegates. But now, it was thought, a change might be inaugurated, giving the House of Representatives greater control over legislation. The *Yomiuri Shimbun*, a newspaper regarded as a Seiyu-kai organ, gave expression to this view. Hitherto, it said, the right of "approval" to legislation vested in the House of Representatives had been practically a dead letter, the decisions of the House having been always swayed by the "elder statesmen." But the time had now come when a political party was strong enough to

assert itself against these external influences, and the nation was keenly watching to see whether the Seiyu-kai would be equal to their great opportunity. The leaders of the Seiyu-kai, at a general meeting of the party held in Tokio on June 15 at which Marquis Saionji, the Premier, was present, spoke to the same effect, though with greater reserve. The gist of the speeches was that now, for the first time in the history of Japanese politics, one party had secured a working majority in the Lower House, and the fact constituted unequivocal evidence of the confidence placed in the Seiyu-kai by the nation. Nevertheless, shortly after the results of the general election became known, rumors began to circulate of the instability of the Saionji Cabinet.

These rumors received their verification on July 4, when it was announced that the Marquis Saionji had placed his resignation in the hands of the Emperor and had recommended Marquis Katsura as his successor. The official explanation given to the surprised and chagrined Seiyu-kai members of the resignation of their leader was the poor state of his health. Of course, this explanation did not satisfy them, since the choice of their leader's successor—not a member of their own party, but affiliated with the Daido Club—clearly showed that the change was not due to personal reasons. But no other explanation could be elicited from their party leaders. The fact seems to have been that the "elder statesmen" and the opponents of constitutional party government were alarmed at the unprecedented electoral success of the Seiyu-kai and were resolved to avoid even the appearance of selecting a cabinet from among the majority party, thus preventing the establishment of a precedent. The disaffection of the commercial classes with the Saionji Cabinet was shrewdly utilized for the occasion, but that the change was dictated by the "elder statesmen," who feared that if the Seiyu-kai remained in power much longer they might become masters of the situation in the Upper House as well as in the Lower, was made manifest by the succession of events following upon the Marquis Saionji's resignation. In the first place the Emperor dispatched Mr. Hitaka to Seoul, the capital of Korea, to consult the Japanese Resident-General in Korea, Marquis Ito. From this mission Mr. Hitaka returned on July 11, and immediately presented his report to the Emperor. The latter thereupon dispatched Prince Iwakura to consult with Prince Yamagata and the Marquises Inouye and Matsukata. At half-past eleven on the morning of the following day Prince Iwakura returned to the Imperial palace, and shortly after noon on the same day Marquis Katsura was summoned and given the Imperial command to form a ministry. No sooner did Marquis Katsura receive the Imperial mandate than he proceeded to consult Prince Yamagata and Marquis Inouye, the Marquis Matsukata being then away from Tokio. On July 14 the names of the new Ministry were published, being identical with the list given above under *Government*, except that Viscount Terauchi temporarily took charge of the Foreign Office in the absence of Baron Komura from the country. Under the influence of their disappointment, some among the Seiyu-kai were at first for fighting the new cabinet. But more moderate counsels soon prevailed, and it was decided to judge every separate proposal on its merits.

FISCAL REFORM. An important official declaration of the financial policy of the new Cabinet was made by Marquis Katsura at a general meeting of the clearing-house bankers held in Tokio on Sept. 10. He said that he considered the adjustment of the finances of the country at this juncture of no less moment than was the financing of the war. Approaching the problem with this conviction, he had found an unexpectedly favorable state of affairs, inasmuch as actual revenue always exceeded estimates, and surpluses remained from appropriations for public works. Nevertheless, it was absolutely necessary to place everything on a firm footing, and the government had therefore elaborated a programme of which the main features were (1) that all expenditure should be brought within the margin of actual visible revenue, refraining totally from loans; (2) that there should not be included in the estimates any anticipated surpluses of yearly revenue; (3) that appropriations of at least 50,000,000 yen should be annually set aside for the redemption of the public debt; (4) that the railways should be placed in a special account, all their profits being devoted to extensions and repairs, and this money being supplemented when necessary by temporary accommodation from the Treasury deposit; (5) that the period for completing the post-bellum programme should be extended from six years to eleven, thereby effecting a total economy of 200,000,000 yen. He firmly believed that the Japanese people might now rest assured as to the stability of their country's finances, and might proceed with their work of material expansion with perfect confidence.

From this declaration it appears that the government has heeded all the essential demands of the commercial classes, and Baron Shibusawa, speaking as the representative of the assembled bankers, expressed entire approval of the government's programme. It has been calculated that the change in the financial status of the State railways would lead to their complete redemption at the end of 23 years, when they would yield an annual revenue of 80,000,000 yen.

POLITICAL PARTIES. Shortly after the election of 1908, the bulk of the newly elected unattached members of the Lower House united to form the Boshin Club. On July 25 resolutions were adopted declaring that the platform of the club should be the adjustment of the finances on a sound basis; the establishment of a system for redeeming the national debts; reform of taxation and development of productive enterprises, and the recasting of the foreign policy of the nation. The club form of organization was adopted in order to assure to the members freedom on all subjects not included in the platform.

It is the custom for members of the Lower House to declare to the chief secretary of the House their political status. The declaration made on Dec. 22, preliminary to the formal opening of the Diet on Dec. 25, showed 192 members of the Seiyu-kai, 67 Progressists, 44 Yushin-kai, 42 members of the Boshin Club, 30 of the Daido Club, and 4 unattached. It was reported that the Progressists were practically split into two factions, which found it hard to continue in one organization. The principal point of difference appeared to be that while one faction believed in continuing the old fight for party government, the other faction was eager to associate with the other minor parties for the support of the Katsura Cabinet. The Premier himself, it was

rumored, by no means looked forward with enthusiasm to such a combination since the Seiyukai would still retain an absolute majority.

In an article on the present status of political parties in Japan, which appeared in the Japanese review *Taiyo*, and the substance of which was reproduced in the *Japan Weekly Mail* of July 18, 1908, it was stated that the election just past had proved once more the stolid indifference of the nation to political questions, the backward state of constitutional government, and the worthlessness of the political parties. The latter are without coherent organization, without pecuniary resources, and without regular organs in the press. The politicians are ordinarily quite inactive, and it is only at election times that they are roused from their lethargy. Then they assume a suppliant attitude to the electors, and where cajolery fails to achieve its purpose, direct bribery is resorted to. It is an open secret that many of the electors regard their votes as articles of merchandise. The speeches of the politicians, moreover, contribute very little to the enlightenment of the electors on public questions.

OTHER EVENTS. A treaty of arbitration was concluded with the United States (q. v.). Early in May the cruiser *Matsushima* sank in consequence of an explosion on board. Over 200 lives were lost. The killing in Peking by a gendarme of ex-Captain Kawakita, a Chinaman who had served with distinction on the Japanese side in the late war, for resisting arrest on a charge of selling official documents to a foreign Power, caused a good deal of comment in the Japanese press. It appears that a number of junior officers in the Japanese army have recently been removed or retired in connection with more or less flagrant scandals. The Far Eastern Colonization Company was organized for the purpose of furthering Japanese colonization and settlement in Korea. The Yalu forestry agreement with China was signed in May. A convention with China in regard to the proposed Hsinmintun-Mukden and Kirin-Changchun railways was concluded on Nov. 12. The advance of the Japanese lines in northeast Formosa was proceeding in 1908 with relatively little bloodshed. The occupied region showed great productive capacity. The international exhibition originally intended to be held in 1912 has been postponed until 1917. Towards the end of 1908 a treaty of amity, commerce, and navigation was arranged with the Republic of Colombia. The Diet was formally opened on Dec. 25, and the New Year's recess began on the 27th, to last until Jan. 20, 1909. See also FORMOSA, KOREA, and MANCHURIA.

JAVA. The most important island of the Dutch East Indies (q. v.), covering an area of 48,503 square miles. With Madura and several smaller adjacent islands, administratively attached to it, it is officially known as Java and Madura, with an area of 50,775 square miles, and a population in 1905 of 30,098,008. The principal cities, with their populations in 1905, are: Batavia, the capital of the Dutch East Indies, 138,551; Surabaya, 150,198; Surakarta, 100,667. In 1905 there were 313 government schools for natives, with 71,256 pupils, and 409 private schools, with 40,882 pupils, besides schools for Europeans and foreign Orientals. Coal (chiefly lignite), limestone, marble, manganese, sulphur, salt, and saltpetre are found. Petroleum has of late attained some prominence. Rice is the most important agricultural product,

followed by maize, cotton, sugar-cane, tobacco, indigo, coffee, tea, cacao, etc. The greater part of the soil is government property. The lands cultivated by natives amounted in 1905 to 7,195,781 acres; Europeans owned 2,321,718 acres; Chinese, 331,117 acres; and other foreign Orientals, 30,289 acres. The "culture system," based on forced native labor, was abolished in 1882, except in regard to the cultivation of coffee. In 1907 the coffee production on government account by the "culture system" was 5,804,816 pounds against 22,215,464 pounds in 1906, and on private account, 15,492,576 pounds, against 35,958,808 pounds in 1906. To make up for the coffee crop shortage of 1907, a considerable quantity of inferior Brazilian coffee was imported for native consumption. The sugar production in 1907 amounted to 1,282,705 tons. The export of tea in 1907 was 29,286,402 pounds. The foreign commerce of Java is included in that of the Dutch East Indies. In 1906 there were 1321 miles of railways. For administrative purposes, Java and Madura are divided into Residencies, each under a Resident, who controls the natives through native officials. The residents are subordinate to the Governor-General of the Dutch East Indies.

JESUP, MORRIS KETCHUM. An American banker and philanthropist, distinguished especially for his generous gifts for the advancement of science, died at his home in New York City, on Jan. 22, 1908. He was born in Westport, Conn., on June 21, 1830, went to New York City with his widowed mother in 1842, and was a clerk for a manufacturing firm until 1852, when he became a member of the banking firm of Clark & Jesup. At the age of 26, he organized the banking house of M. K. Jesup & Co., which subsequently became the firm of Cuyler, Morgan & Co., Mr. Jesup being a special partner. The Canadian Pacific Railroad, and other important commercial enterprises, were financed in part, or entirely, by these concerns, and Mr. Jesup himself became very wealthy through the almost uniform success of his business undertakings. He was president of the New York Chamber of Commerce from 1899 to 1907, during which period he was active in all of the affairs of that body, gave freely to the charitable projects, and was the largest individual subscriber to the fund of \$1,500,000 for the new Chamber of Commerce building. He gave generously to, and was deeply in sympathy with, many of the charitable, religious and educational institutions of New York City; he was one of the founders of the Young Men's Christian Association of the city, and its president in 1872; was president in 1881-1903 of the New York City Mission and Tract Society, for which he built the De Witt Memorial church, and was a trustee of the Union Theological Seminary, to which he gave Jesup Hall. He was also a founder and a liberal patron of the Syrian Protestant College, at Beirut, Turkey. He gave the Morris K. Jesup Fund to Princeton University for library uses; Jesup Hall to Williams College; the Forty-fourth Street Lodging House for Boys, for the New York Children's Aid Society, and in 1905 endowed a chair in Union Theological Seminary "to spread the teachings of the Savior."

Even more notable was his encouragement of scientific research. These benefactions were incident to his presidency of the American Museum of Natural History, in New York City, an office

he held from 1881 to 1907. As president of the Museum's East Asiatic committee he was a patron of Dr. Berthold Laufer's work in China. In 1897 he established the Jesup North Pacific Exploration Fund, which, in 1900, made possible the exploration of MM. Bogoras and Jochelson of the Amur region, in Siberia, while in 1903, from the same fund, an expedition was outfitted which explored in British Columbia and afterward in Washington. To the various Peary Arctic expeditions he also gave about \$200,000.

Mr. Jesup gave to the American Museum \$100,000, which was used in preparing a collection of woods of the United States. His steady purpose was to make the Museum not only a means of popularizing science, but of carrying on intelligent research and exploration in unknown fields. By his will he left \$1,000,000 for the continuance of investigations along those lines.

JEWS. The statistics of the number of Jews in the world rests largely upon estimates. Only in Russia, Austria-Hungary, Germany, and a few other countries, are official figures obtainable. According to the estimates given in the *American Jewish Year Book* for 1908-9, which are compiled from various sources, the total Jewish population in 1908 was 11,577,473. Of these, the largest number, 5,215,805, was in Russia. In Austria-Hungary there were 2,076,378; in the United States, 1,777,185; in Germany, 586,948; in Turkey, 463,686.

By comparison with 1907, the year 1908 was a quiet one in Jewish annals. Something of a reaction was discernible, especially in Russia, where liberal ideas appeared to lose ground, and the revolution, though it still existed, had been driven under cover. Some discussion was carried on early in the year as to whether Jews should or should not be recruited for the Russian army. It was shown by official figures that the charge that Jews would not serve, was groundless. The total number of Jews in the Russian army was given at 54,276. There was considerable discussion in the Duma over questions relating to the Jews. The constitutional Democrats took the stand that such questions should not be debated. Some of the Russian leaders considered the advisability of denationalizing the Jews after the manner of Rumania.

An incident of the year was the resignation of certain professors of the Polytechnic Institute at Kiev on account of the order of M. Stolypin, expelling the Jews from the institute. The feature of the year in Russia was the pardons distributed after the trial of Pogromists at Kiev and Bialystok. After the convictions at Kiev, the court petitioned for amnesty. The League of Genuine Russians, as usual, placarded many anti-Jewish proclamations, and there were pogroms during the year, especially at Odessa. Odessa was the chief seat of the prosecutions against the Jews during the year. In January there were serious riots. The Prefect was unable to keep order, and a Jewish deputation went to St. Petersburg to complain of his incompetence. An agreement was reported to have taken place among the four Jewish parties, Zionists, Jewish People's Group, Jewish People's Party, and Jewish Democratic Group. A conference, which was regarded as important, took place between the Zionists and the Socialist Party.

In Austria, four Jewish members of the Austrian Reichsrath formed a Jewish club, to act

in concert on all Jewish questions. A convention of the General Jewish Union was held in Vienna on April 27 and succeeding days. About 150 delegates were present, representing 90 congresses, and a national organization was effected. The 35th general meeting of the Israelitische Allianz of Vienna showed that 176,500 kronen had been collected for Rumanian relief, of which nearly one-third came from America.

In France, Rabbi Alfred Lévi was chosen to succeed the late Zadoc Khan as Grand Rabbin in France, and was inducted into office on April 6. By a bequest of Baroness Adolphe de Rothschild, 10,000,000 francs was made available for Jewish charity. Out of this sum, the Board of Guardians of Paris will build a Jewish hospital.

In Germany, the work of the Hilfsverein der Deutschen Juden was carried on effectively during the year. Its membership increased to 18,000, located in over five hundred German cities and towns, and its income from duties amounted to 130,000 marks. It supports thirty-five schools and 4000 pupils.

In Rumania the government is engaged in a deliberate and consistent campaign against Jews. Expulsion from villages, which began in March, 1907, continued throughout 1908, and industrial shops, even when owned by Jews, were not allowed to have more than one-third of their employees of that persuasion. A new law was passed forbidding "aliens" to engage in the wine business, and thousands of Jews were ruined. It was estimated that 10,000 Jews were affected by the explosion decrees.

In the United States the immigration of Jews fell off considerably during the year as the result of industrial conditions. From Sept. 1, 1907, to June 1, 1908, 54,539 Jews landed at the port of New York, as against 77,371 in the corresponding period of 1906-7. Of these 39,164 came from Russia. The various charitable and philanthropic organizations carried on their work during the year. The United Hebrew Charities was obliged to close its doors in Dec., 1907, for a short period on account of lack of funds.

ZIONISM. Several new undertakings were begun by the Palestinian Mission. These were the Olive Tree Society, the Palestine Land Development Company, and the Palestine Bureau. President Wolffsohn made a number of trips in behalf of the movement and was received in audience by the Sultan. He declared that the Sultan was in sympathy with the Zionist movement. He also visited Russia in order to remove the objections of the Russian government to the Zionist movement. The usual annual Conference of the Federation of American Zionists was held at Atlantic City. The chief result of the conference was the determination to continue a more thorough and better organized campaign of propaganda.

JOHNS HOPKINS UNIVERSITY. An institution of higher learning at Baltimore, Md., founded in 1876. In 1907-8 the attendance was 683, and in the autumn of 1908, 700. In 1907 the trustees decided to admit women to the graduate courses, and five women attended during 1907-8. In the autumn of 1908 the number was about 20. About thirty women are enrolled in the medical department, which was opened to them at its beginning in 1893. By the liberality of Mr. Henry Phipps, of New York, a psychiatric clinic is to be established at the Johns Hopkins Hospital, and its director, Dr. Adolf

Meyer, will be professor of psychiatry in the university at its beginning in Oct., 1909. The new site of the university at Homewood has been surveyed, and plans for the new buildings are in preparation, but these will not be begun until at least \$1,000,000 is available for that purpose. The endowment of the university is \$4,470,000. Its present academic buildings, equipment and grounds are valued at more than \$2,000,000. Recent noteworthy appointments in the faculty include besides Dr. Adolf Meyer, mentioned above, Dr. Edward F. Buchner as professor of philosophy and education, and Dr. John B. Watson as professor of experimental and comparative psychology. A botanical laboratory and a greenhouse have been erected and are now occupied for advanced research. An athletic field has been completed and is now in use, and a concrete grandstand, seating 2000, was erected. The president is Dr. Ira Remsen.

JOHNSON, JOHN ALBERT. Governor of Minnesota. He was born at Saint Peter, Minn., on July 28, 1861. He was obliged to leave school at an early age in order to assist his mother in the support of the family. In 1886 he became editor of the Saint Peter *Herald*, and shortly afterward began to take an active part in politics. At first a Republican, he joined the Democratic party because of his belief in tariff reform, and in 1898 was elected State Senator. He was offered the Democratic nomination for Governor in 1902, but declined. In 1904, however, he accepted the nomination and was elected by about 7000 plurality, although the Republican Presidential ticket received about 161,000 plurality. He was reelected in 1906 by about 72,000 plurality and again in 1908 by about 30,000. As Governor, Mr. Johnson has successfully advocated a maximum schedule for freight rates, a two-cent passenger fare law, the abolition of railway passes and franks, the abolition of private banks and many other measures similar in import. All this he has accomplished despite the fact that the State Legislature has been controlled by those of the opposite political faith. In 1908 the opponents of Mr. Bryan in the Democratic party endeavored to make Mr. Johnson the presidential nominee, but Mr. Bryan's hold was too strong, Mr. Johnson receiving 46 votes in the National Convention. The University of Pennsylvania, in 1907, conferred upon Mr. Johnson the degree of LL.D. See **PRESIDENTIAL CAMPAIGN AND MINNESOTA.**

JOHNSON, TOM LOFTIN. An American politician, was born in Georgetown, Kentucky, on July 18, 1854. He went to work in a rolling mill while a boy, and afterwards entered the office of a street railway. When eighteen years old he invented a new rail and started its manufacture. He also acquired interests in street railroads in Indianapolis and Cleveland and amassed a fortune. He was a Democratic member of Congress from Cleveland from 1891 to 1895 and thereafter spent some years in developing the Nassau Electric Railway system in Brooklyn, which he afterwards sold to the Brooklyn Rapid Transit Company. He has always been a radical Democrat and became a believer in the single tax theory of Henry George, and in municipal ownership of public utilities. In 1901 he was elected Mayor of Cleveland on the issue of three-cent fares, and was reelected in 1903, 1905 and 1907. During his tenure of office he has carried on a strenuous

fight with the city's transit corporation, which resulted after his last election in an agreement by which the street railways were to be operated by a holding company controlled by the city and three-cent fares were provided for. The company immediately began to show a deficit and a plan of reorganization advocated by him was defeated at a referendum election held in Oct., 1908. He has also taken a prominent part in State politics and was the candidate for Governor on the Democratic ticket in 1903. He was the Ohio member of the Democratic National Committee from 1904 to 1908, and was defeated for reelection in the latter year. See **OHIO.**

JOHORE. A British protectorate at the southern extremity of the Malay Peninsula. Area, 6950 square miles; population, 200,000; chiefly Malays and Chinese. The chief town is Johore Bahru, 15 miles north of Singapore. Rubber plantations are extending. The number of estate laborers in 1907 was 1952. Pepper, sago, tea, coffee, gambier, and gutta percha are exported. The administration is by the native sultan and subordinate chiefs. The foreign relations are controlled by Great Britain.

JOLY DE LOTBINIERE, SIR HENRY GUSTAVE. A Canadian statesman, died on Nov. 16, 1908. He was born in 1829, was admitted to the bar in 1855, and became Queen's Counsel in 1878. He was a member of the Canadian Assembly in 1861, and upon the organization of the Dominion government in 1867 became a member of the House of Commons, and also served for many years as a member of the Quebec Assembly. He was Premier of Quebec in 1878-79, Minister of Inland Revenue of the Dominion in the Liberal Cabinet from 1896 to 1900 and in 1900-05 was Lieutenant-Governor of British Columbia.

JONES, JAMES KIMBROUGH. An American politician and soldier, and ex-United States Senator from Arkansas, died on June 1, 1908. He was born in Marshall County, Miss., on Sept. 29, 1839, at the outbreak of the Civil War enlisted in the Confederate Army, and served until the war closed. He then became a planter, studied law, and in 1873 was elected State Senator, subsequently becoming president of that body. In 1880 he was elected to Congress, where he served until 1885, when he was elected to the United States Senate. As a United States Senator he soon became one of the most prominent of the Democratic leaders, and for years held the post of chairman of the Democratic caucus. He was an ardent tariff reformer and a warm supporter of William Jennings Bryan, although in the Democratic National Convention he had strongly opposed Bryan's first nomination. In the campaign of 1896 and 1900 he served as chairman of the Democratic National Committee. At the close of his senatorial term in 1903 he retired from active participation in politics and took up the practice of law in Washington.

JUPITER. See **ASTRONOMY.**

JUVENILE COURTS. The tendency shown by the recent legislation with reference to the care of wayward children, is to place their disposal or punishment in the hands of special courts where they must be tried with due privacy. It is believed that

less disgrace and demoralization will thus result from the child's appearance in court, and that the child will receive more sympathetic and reformatory treatment. Moreover, the recent legislation provides for the parole of offenders on their own responsibility, or their release under suspended sentence, but in the custody of probation officers. Georgia, Louisiana, Ohio, and Rhode Island passed such laws in 1908. The Georgia law provides that upon the petition of two successive grand juries, a juvenile court may be established in any county; that the judges to sit in such courts shall be those of the Superior Court, except that in their absence judges of city courts may sit. The law provides for probation officers and, as is usual with the newer legislation, gives the court very wide discretion in providing for the education, employment, or punishment of wayward children. The Louisiana law provides for the establishment of a juvenile court in the parish of New Orleans. These new laws in Georgia and Louisiana are indicative of the new spirit in Southern States, in others of which a strongly favorable sentiment has developed. In Rhode Island, children's cases are taken out of probate courts and placed exclusively in the jurisdiction of district courts. The law grants the custody of any neglected child to the Society for the Prevention of Cruelty to Children, which may place it in a private family, having regard for the religious belief of the parents. Any adult contributing to juvenile delinquency is made punishable by a fine of \$500, or imprisonment for one year, or both. The Ohio law was a comprehensive statute unifying much recent legislation on the care of children.

A study made in April of the results achieved by the juvenile court in Chicago, where it has been longest established, showed that there have been fewer and fewer cases brought before it. For the calendar year 1907, the cases numbered 3266, or 528 less than in 1906, while in 1908 a similar falling off was observable. This was believed to be due largely to the probation system, though partially due also to new playgrounds (q. v.) and recreation centres and the activities of the Juvenile Protective League. (See JUVENILE DELINQUENTS.) On the other hand, some interpreters held that the decrease in the number of cases indicated that probation officers and others responsible for correcting wayward children had become more lenient and more inclined to excuse offences as they became personally acquainted with delinquents.

Speaking of juvenile courts at the National Conference of Charities, at Richmond, in May, Judge Mack, of Chicago, stated that the most vital part of the new court system is the work to be done by the probation officer. He held that this officer should be an educator rather than a guard and should be able from intimate acquaintance with the child and its home life to direct its development along lines preparing for good citizenship. Moreover, probation work, he said, should be more closely correlated with the efforts of playground associations and juvenile protective leagues. As an addition to the present equipment of juvenile courts, Judge Mack advocated that there should be a medical department to examine each child for adenoids, poor sight, and nervous diseases, these being common causes of truancy and waywardness.

CANADA. A new law, approved June 20, introduced some of the best elements of the juve-

nile court system into the Canadian judicial administration. The juvenile courts are to have exclusive jurisdiction in cases of delinquency of children and youth, except when a child over fourteen is charged with an indictable offence. The court proceedings must be held privately; children may not be confined in jails, but detention houses must be provided. The law provides for the use of the suspended sentence and the appointment of probation officers. Parents are made punishable by fine for contributing to juvenile delinquency. When children are placed under the guardianship of others than their parents, regard must be had of the religious faith of the latter. The law may be made operative in any province, city or town by the publication of the appropriate proclamation.

EUROPE. The favor found for the institution of special courts for the care of neglected and delinquent children in this country, has resulted in a practically world-wide movement for their introduction under the lead of the International Juvenile Court Society. In England, a new law of Parliament requires that in every city and town of moderate size, one or more rooms shall be set aside for the trial of juvenile offenders. Only adults peculiarly interested are to be allowed in the children's court during sessions. Probation officers and the parole system are authorized for every such court. No child may henceforth be sent to prison, and youth under sixteen may be imprisoned only for special offences. Remand or detention houses are to be used for those wayward youth who need closer supervision than parole permits. These homes are expected to enable such youth to break entirely their connections with demoralizing associates. In France, as a result of the visit of a representative of the American Society for the Prevention of Cruelty to Children, and the visit to this country of two French investigators, the juvenile court system is being gradually approached. In Italy, as the result of the efforts of those interested in the American system, a circular of the minister of justice, issued May 10, 1908, provides that juvenile cases shall be heard separately and always by the same judge; that they shall be treated in a psychological rather than a punitive spirit, and that children not concerned shall not be allowed in court rooms. The Italian law makes possible the parole of youthful first offenders, but does not provide any probation system. To remedy this defect, a society of volunteer probation officers and supporters was formed in Rome in 1906. It proved successful, and in 1908 was copied in Milan, Florence, and Turin. These societies number more than one hundred members each. They have enrolled among them leading citizens of all ranks, and have thus acquired prestige with the courts as well as means for the support of capable probation officers. Moreover, in 1908 they were subsidized by the government. See JUVENILE DELINQUENTS and PLAYGROUNDS.

JUVENILE DELINQUENTS. As in the years immediately preceding, so also in 1908, considerable attention was given to the subject of the proper treatment of youthful delinquents. This movement for the more intelligent care of those boys and girls who at tender ages come within the grasp of the law, is only a part of the growing regard for child life finding expression in greater protection of youthful workers (see CHILD LABOR) and the provision

by cities of recreation centres and playgrounds (q. v.). So closely is juvenile crime connected with nervous or physical disorders and with neglect on the part of parents or guardians, that laws dealing with youthful offenders customarily include neglected and dependent children as well. At the fifth annual Conference on Education of Backward, Truant, and Delinquent Children, at Hampton and Richmond, Va., in May, at which about 100 delegates were present, especial attention was given to the advantages of private over public institutions for the care of dependent and delinquent children. Dr. D. C. Potter, examiner of accounts for the city of New York, stated that that city employed private institutions for the following reasons: (1) the system of public care has been tried and found thoroughly bad; (2) the present system secures freedom from partisan politics, enlists the co-operation of citizens and secures for the child the influences of its parents' religion; and (3) the system of hiring private institutions is more economical than any system of direct public care. This last point was substantiated by the statement, that while city paid about \$135 each for the annual support of children in private institutions, with \$15 additional for those attending school, it has provided for the public care of truants in a public institution at a cost of \$275 each year. While other speakers made some defense of the system of public care, the system most generally supported was the Massachusetts system of placing children in private homes. This same system is followed by the Society of St. Vincent de Paul, and was warmly approved at the seventy-fifth anniversary at Richmond, May 3-6. At Richmond in early May was held also the thirty-fifth National Conference of Charities and Corrections, at which considerable attention was given in the children's sessions to the subject of juvenile delinquency, and especially to preventive measures. One session, devoted to children in families not their own, brought out the great advantages to morals and health of the training given such children when placed in suitable homes. The great responsibility assumed in choosing a home, the danger, if not disaster, resulting from an ill-considered choice, and the necessity for keeping in personal touch with the child and its new home by the agency placing it, were emphasized.

A report on the work of the Juvenile Protective League, formed at Chicago in 1907, showed that in one year the League, which is supported by voluntary contributions, had investigated all the five-cent theatres in the city, resulting in the elimination of demoralizing pictures and scenes; dance halls had been regulated, successful prosecutions of dealers in cocaine and tobacco for selling to children, had been made, and libraries had been started in rooms where messenger boys assemble. Writing on the subject of youthful crime, Professor Hugo Münsterberg, of Harvard University, stated (*McClure's*, April) that the United States was spending several hundred million dollars more per year in fighting crime by repressive agents than by preventive measures, such as education, charity, and religion. Analyzing the inmates of a school for criminal boys he found that out of 200 boys present, 127 were mentally defective, being either weak-minded or showing a tendency toward hysteria and epilepsy. Study-

ing the records of their parents, he found that in 85 cases there was drunkenness on the part of one or both parents, in 24 cases insanity, in 26 cases epilepsy, and in 26 additional cases some nervous disease. This analysis fully bore out Professor Münsterberg's contention that society fights crime from the wrong direction, that is, after rather than before the conditions making it inevitable have wrought their effects. Judge Ben B. Lindsey, of Denver, who has had years of experience in juvenile cases, writing in *Charities and the Commons*, as to the relative responsibility of the school and the home for youthful waywardness, stated emphatically that the latter is "infinitely" more responsible than the former.

During 1908, Georgia, Louisiana, Michigan, Ohio, and Rhode Island enacted laws relating to the care of neglected, dependent, and delinquent children. The Georgia law provided only for juvenile courts, while those of the other States were comprehensive laws relating to these children under sixteen years of age (seventeen in Louisiana), authorizing certain courts to have exclusive jurisdiction over them (see JUVENILE COURTS), and providing for the support of dependent children, the disposition or punishment of wayward or criminal children, and the punishment of adults who contribute in any way to juvenile delinquency. See also PLAYGROUNDS.

In England there has been a decrease in juvenile delinquency according to the official report on the prison population. The number of prisoners of ages twelve to sixteen fell from 1630 in 1897 to 556 in 1908. The report points out an indisputable connection between lack of employment after leaving school and the drifting of youth into criminal careers. It is also pointed out that the stature of "juvenile-adult" offenders, those of ages sixteen to twenty, is at each age less than the average stature of the artisan population, and still more below that of the rural population or of the general population. See JUVENILE COURTS for new English law.

KAMERUN. A German protectorate in West Africa. Area, 190,600 square miles; population, 3,500,000. In 1907 there were 1010 whites (860 Germans). Buëa is the capital. Duala has 22,000 inhabitants. Government schools at Duala, Victoria and Garna have some 500 pupils. Mission schools have 16,000 pupils. European plantations cover nearly 20,000 acres, cacao being the most important product, followed by rubber, kola, and coffee. In 1906 there were produced 1098 pounds of cotton. In 1907 the imports were valued at 17,296,547 marks, against 13,305,514 marks in 1906, mostly cottons, beverages, timber, salt and iron manufactures; the exports amounted to 15,867,021 marks, against 9,945,903 in 1906, mostly palm-kernels, palm-oil, rubber, cacao and ivory. There is a railway of 22 miles from Victoria to Lisoko. At the end of 1907 about 100 miles of railway were in construction. The length of telegraph in 1908 was about 500 miles. The budget for 1908-9 balanced at 10,610,239 marks, of which 2,780,139 was an Imperial subvention. The military force in 1908 numbered 1454 (1300 natives). The Governor in 1908 was Dr. Th. Seitz. A convention with France in April, 1908, delimited Kamerun from the French Congo.

The Colonial Secretary, Herr Dernburg, announced on March 4, 1908, that owing to the

reckless exploitation of the rubber forests, they were being rapidly destroyed. The trade was attended with serious abuses. Large numbers of the natives were drawn away from their usual pursuits and the caravans levied contributions upon the inhabitants. The effects were, he said, injurious to the colony, and for this reason, and especially to prevent the exhaustion of the rubber forests, the government had restricted the trade and closed certain districts to the traders. The government's aim was to withdraw the natives from the caravan traffic and send them back to their usual agricultural occupations.

KANSAS. One of the North Central Division of the United States. Its total area is 82,158 square miles. The population in 1908, according to Federal estimate, was 1,677,168.

MINERAL RESOURCES. The great oil field, which includes the Kansas fields, is known as the Kansas-Oklahoma field. This field ranks second in the output of crude petroleum among the States. In 1906 interest in the Kansas fields was subordinated to the Oklahoma fields with the result that only one-tenth as many wells were drilled in Kansas in that year as in the new State. This condition continued in 1907. The production of the Kansas fields in 1907 was 2,409,521 barrels, valued at \$965,134. A portion of this was taken from storage, but as it entered into consumption in 1907, it is considered as marketed production for that year. Counties producing the largest quantity of oil are Chautauqua, Montgomery and Neosho. The total output of the Kansas-Oklahoma field was more than double that of 1906, the respective figures being 46,846,267 barrels and 22,836,553 barrels. The coal industry, which is one of the chief mineral industries of Kansas, had an exceptionally prosperous year in 1907. The total production was 7,322,449 short tons of a spot value of \$11,159,698. The production of 1907 exceeded that of 1906 by 1,297,674 short tons or 21.53 per cent. in quantity and by \$2,180,145 or 24.28 per cent. in value. The coal output of the State in 1907 was more than double that of 1898 and the increase in 1907 over 1906 was larger than the total production of the State in 1885. Coal mining suffered materially from lack of labor supply. In 1907 the total number of men employed was 12,439, while in 1906 there were 14,355 men employed in the mines. There were 32 men killed in the coal mines of Kansas during 1907. In the production of 1907 only six machines were used in mining. The original coal supply of the State is estimated by the United States Geological Survey to have been 7,022,000,000 short tons, from which there had been mined to the beginning of 1908 91,176,204 tons. The smelting of zinc is one of the most important industries of the State, owing to the abundance of natural gas and the central location. In 1907 the output was 13,850 short tons, as compared with 3902 short tons in 1906. Kansas ranks fourteenth among the States in the value of its clay products. These products were produced in 1907 to the value of \$2,370,058 as compared with \$2,432,371 in 1906. The Portland cement industry has developed in the State to great proportions. Its rank in 1907 was fifth. There were produced in that year 3,353,925 barrels of Portland cement valued at \$4,240,358 as compared with 3,020,862 barrels in 1906, valued at \$3,908,708. This industry has developed entire-

ly since 1900, when no production was recorded. In the production of salt Kansas ranks fourth among the States, being surpassed only by New York, Michigan and Ohio. The production in 1907 was 2,667,459 barrels, valued at \$962,334 as compared with 2,198,837 barrels in 1906, valued at \$621,082. Mineral waters were produced in the State in 1907 to the value of \$61,454. The production in gallons was 362,252, as compared with 305,957 in 1906. Among other mineral products of the State are coal products, sand-lime brick, zinc lead and zinc white. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$28,577,044, as compared with a value in 1906 of \$22,584,076. Estimates indicate that the production of coal in the State in 1908 was 20 per cent. less than in 1907.

AGRICULTURE. The statistics prepared by the Kansas Board of Agriculture indicate that the agricultural product of Kansas for 1908 was the greatest in the history of the State. The total value of the farm products and live stock was \$475,244,831 or \$11,596,224 in excess of 1907, which was the best prior year. A heavy decrease is reported in the value of products of live stock, although in the aggregate the live stock on hand was worth practically the same as in the year preceding. The quantity of agricultural products and the acreage is as follows: wheat, 76,808,922 bushels from 6,930,351 acres; corn, 150,640,516 bushels from 7,057,535 acres; oats, 16,707,979 bushels from 831,159 acres; rye, 361,476 bushels; barley, 2,657,122 bushels; potatoes, 6,419,685 bushels; broom corn, 11,595,740 pounds; sugar beets, 553,178 tons; butter, 42,205,266 pounds. The poultry and eggs sold were valued at \$9,306,651. The animals slaughtered or sold for slaughter were valued at \$67,755,158. The value of the horticultural and garden products was \$786,879. Although the area devoted to wheat was less than that of 1907 by 295,932 acres, the yield of 1908 was an excess of 2,653,227 bushels and is 3,748,000 bushels more than the average for the ten years ending in 1907, which is the most valuable wheat crop ever produced in the State. The average value per bushel was about 83 cents, the highest since 1881. The spring wheat area showed a decrease as that crop was practically a failure, especially in the northwestern counties, where it is grown with more or less persistency. Indications point to a smaller area sown to winter wheat in the fall of 1908 than in the fall of 1907. The value of the corn produced was \$2,642,461. Although ranking fifteenth in aggregate yield, it is first in value. While the area planted was only 248,523 acres greater than that of 1907, the value of the product was \$19,601,718 more. The average yield per acre was approximately the same as in 1907, but the price per bushel averaged more than 11 cents, or 26.6 per cent. higher. Corn is the most important soil product in the State. On an area of 831,159 acres, about 25 per cent. less than the area in 1907, 2,603,785 more bushels of oats were produced in 1908 than in the former year. Emmer (speltz), reported for the first time this year, is credited with 30,469 acres yielding 934,941 bushels, valued at \$437,606. While less in area than a year ago a larger crop of potatoes was harvested, and worth \$316,732 more than

the crop of 1907. The non-saccharine and sweet sorghums for forage both show increases in areas, and the combined value of their production is \$1,456,177 greater than in 1907. The yield of hay was abundant. The alfalfa field of 878,283 acres is an increase of over 18 per cent. over the area of 1907. The numbers and values of the live stock in 1908 were as follows: Horses, 928,956, valued at \$95,682,468; mules and asses, 144,967, valued at \$17,399,640; milch cows, 687,432, valued at \$21,310,392; other cattle, 1,953,435, valued at \$42,975,570; sheep, 136,191, valued at \$531,145; swine, 2,705,057, valued at \$19,611,663. The total value of the live stock in the State was \$197,510,878. The wool production in 1908 was valued at \$201,600.

MANUFACTURES. A comparison of the census of 1905 with that of 1900 showed an increase of 49.1 per cent. in the capital, 31.2 per cent. in the number of wage-earners, and 28.7 per cent. in the value of products, the figures for 1905 being, respectively, \$88,680,000, \$35,570, and \$198,244,990. The four leading industries, slaughtering and meat packing, flour and grist mill products, railway repairing, and smelting and refining zinc, showed values in 1905 of \$96,375,600, \$42,034,000, \$11,521,000 and \$10,999,400, respectively. These values were increases over those of 1900 of 24.5, 97.1, 69 and 90 per cent. respectively.

EDUCATION. The consolidation of rural schools, which was undertaken under legislation passed several years ago, more than doubled in the State in 1907-8. The school population (ages 5 to 21), according to the last biennial report of the State Superintendent, was in 1908, 507,630, of whom 392,009 were enrolled in public schools and 290,904 were in average attendance. Of those in average attendance, 205,186 were in rural districts, 103,039 in first and second class cities, and 2779 in county high schools. The average length of term was 141 days for rural schools and 180 days for city schools. The total number of teachers employed was 12,985, of whom 8,357 are females. This was exclusive of the 2339 teachers in the cities of the first and second class. There were thirty colored teachers. The average monthly salary of rural school teachers was \$48.32 for men and \$43.76 for women. The average length of school term was 6½ months. Grade teachers in cities received an average of \$54.38 per month, and high school teachers, \$73, the average length of term being 8 2-3 months. There were 22 county high schools, employing 109 teachers, giving four-year courses. The total revenue for school purposes was \$7,335,433, of which \$5,958,919 was received from district taxes and \$569,765 from State and county school funds. The number of counties in which high school education is made free to all has been greatly increased.

FINANCE. The Treasurer's report for the fiscal year ending June 30, 1908, showed that there was a balance July 1, 1907, of \$760,266.95. The total receipts for the fiscal year ended June 30, 1908, were \$5,195,952.13 and the expenditures, \$4,910,568.43, leaving a balance on July 1, 1908, of \$1,045,460.65. The amount of revenue for taxes received to June 30, 1908, was \$2,709,251.54. The tax levy for 1908 was \$2,208,322.66 on the assessed valuation of \$2,453,691,859. The tax rate for the State was nine-tenths of a mill. The property in the State, previous to 1908 was assessed at one-third to one-tenth of its actual value. In 1908 the property was assessed at its

actual value. The permanent school funds of the State were \$724,695.67.

CHARITIES. During the fiscal year 1908 the Board of Control, which has exclusive business management and supervision over the nine State charitable institutions in the State, spent about \$20,000 in equipping these institutions with adequate fire escapes and fire protection. By way of fire protection the Board has placed chemical fire extinguishers in each institution not already provided, and increased the general facilities for fighting fire in all of these places. A new \$65,000 administration building was erected at the State Hospital for Epileptics at Parsons, a new \$60,000 custodial building at the School for Feeble-minded Youths at Winfield, two new cottages for female patients and additions for about 170 more male patients at the Topeka State Hospital. There was erected at the Topeka State Hospital a pavilion for tuberculous female patients. Many other new and needed improvements were made at these various institutions, which places them upon a higher plane than they have heretofore been. The total salaries paid in the nine institutions for the fiscal year ended June 30, 1908, was \$255,841.63. The total expended for maintenance and repairs for the same period was \$147,156.19. The population, June 30, 1908, was as follows: Topeka State Hospital, 1100; Osawatimie State Hospital, 1298; Parsons State Hospital, 396; School for Feeble-minded Youth, 389; Soldiers' Orphans' Home, 170; Boys' Industrial School, 205; Girls' Industrial School, 195. The number of pupils in the School for the Deaf at the close of the school year was 236; in the School for the Blind 88.

POLITICS AND GOVERNMENT. A new primary election law went into effect in 1908, and the first primary election was held in the State on Aug. 4th. (See PRIMARIES DIRECT.) For an account of the results of this election see paragraph *Conventions and Elections* below. By the operation of this law independent voting is facilitated, as one who uniformly votes a Democratic ticket may vote in a Republican primary, and similarly a Republican voter may vote in a Democratic primary. No voter, however, can vote in both primaries at the same election. An advantage of this system is that nominations cannot be dictated by political machines. On March 10th, the railroads of the State appealed to the United States Circuit Court for a restraining order enjoining the Kansas State Board of Railroad Commissioners and Attorney-General F. S. Jackson from putting into effect on April 1st the schedule of maximum freight rates, the order for which was entered by the Board on Feb. 14. It was alleged that the new schedule would cause a reduction in freight tariffs of from 20 to 25 per cent. The railroads applying for this injunction were, the Santa Fé and Rock Island, the Missouri Pacific, the Union Pacific, the Burlington, the Missouri, Kansas and Texas, the St. Louis and San Francisco, the Topeka and Northwestern, the Leavenworth and Topeka, the Leavenworth, Kansas and Western, and the Kansas Southwestern. On May 27, United States Judge Pollock granted a temporary order restraining the Railroad Commission from putting these rates into effect. On June 18, the International Harvester Company was fined \$12,600 for violating the State law of stifling competition. It was charged by the State that implement dealers in Topeka were compelled to sign a contract with the company to handle no other harvesting ma-

chinery except that made by the International Harvester Company and the schedule of prices was not to be violated. The company was adjudged guilty on 43 counts. On Feb. 11th, the city of Leavenworth voted to adopt a commission form of government, similar to that of Galveston, Tex. On Jan. 30th, the Kansas Legislature passed a bill for the insurance of bank deposits under the general supervision of the State Treasury Board, but the bill was vetoed by Gov. Hoch, who objected to its details, while himself favoring a joint bank guarantee of deposits.

CONVENTIONS AND ELECTIONS. The Republican State Convention for the election of delegates to the Republican National Convention met in Topeka on March 4. Resolutions were adopted endorsing the administration of President Roosevelt, and the four delegates chosen were instructed to vote for William H. Taft for President. The Democratic State Convention met at Hutchinson in June. The delegates chosen were instructed to vote for William J. Bryan for President. Primary elections for the nomination of candidates for the United States Senate and for State officers were held in the State on Aug. 4. Senator Chester I. Long was a candidate for reelection, and opposed to him was Joseph L. Bristow, who, as fourth assistant postmaster-general under President McKinley, did very efficient service in the prosecution of frauds against the government. Mr. Long had the general support of the railroad and the more conservative business interests of the State, while Mr. Bristow was representative of the more radical element. He received the aid in his canvass of Senator La Follette of Wisconsin, with whose policies he is largely in sympathy. The result of the election was, in general, a great surprise, as it had been commonly expected that Senator Long would be reelected. Of the 165 legislative districts of the State Mr. Bristow carried 105. W. R. Stubbs received the largest number of votes as Republican candidate for Governor, defeating Cyrus Leland by about 20,000 majority. J. D. Botkin was nominated as the Democratic candidate for Governor. In the election of Nov. 3, William H. Taft received 197,298 votes, William J. Bryan 161,086, E. F. Chafin 5033, E. V. Debs 12,420. The plurality of Stubbs for Governor was 34,027. There were elected 40 Democratic Representatives and 6 Democratic Senators, 84 Republican Representatives and 34 Republican Senators. The Republican majority in the Legislature assured the election of Joseph L. Bristow to the United States Senate.

LEGISLATION. Among the laws passed at the legislative session of 1908 were the following: An act was passed providing for the inspection of concentrated feeding stuff and for the marketing of the same. Measures were enacted prohibiting the use of sulphites or any preparation containing sulphur dioxide or any secret preparation in the manufacture of meat products. Products so treated are declared to be adulterated, and the offender is subject to the penalties relating to adulterated foods. Primary election laws were enacted as noted above, and are described in the article **PRIMARIES DIRECT**.

STATE OFFICERS. Governor, W. R. Stubbs; Lieutenant-Governor, W. J. Fitzgerald; Secretary of State, C. E. Denton; Treasurer, Mark Tullay; Auditor, J. M. Nation; Attorney-General, F. S. Jackson; Adjutant-General, to be named; Superintendent of Education, E. T. Fairchild; Commissioner of Agriculture, F. D. Coburn; Super-

intendent of Insurance, Chas. Barnes—all Republicans.

JUDICIARY. Supreme Court Chief Justice, Wm. A. Johnston; Associate Justices, Chas. B. Graves, Silas Porter, Clark A. Smith, Rousseau A. Burch, Henry F. Mason and Alfred W. Benzen, all Republicans; Clerk, D. A. Valentine.

The State Legislature of 1908 was composed of 37 Republicans and 3 Democrats in the Senate, and 94 Republicans and 31 Democrats in the House. The State representation in Congress will be found in the article **UNITED STATES**, under the section *Congress*.

KANSAS, UNIVERSITY OF. An institution of higher learning at Lawrence, Kan., founded in 1864. The attendance in 1908-9 was about 2250. In June, 1908, 272 degrees were awarded. A new engineering building erected at a cost of \$250,000 will be ready for occupancy in September, 1909. A close relationship exists with the high schools of the State, 150 preparing students for admission to the freshman class. The endowment of the University is \$151,000, and its income \$294,000, chiefly from the State. The faculty in 1908 numbered 117. The Chancellor is Dr. Frank Strong.

KARSTEN, HERMANN. A German naturalist, died in August, 1908. He was born at Stralsund on Nov. 6, 1817, studied medicine and natural history in Rostock and Berlin, and after traveling in Venezuela and Ecuador (1843-47 and 1848-56), returned to Berlin, where he specialized in botany. In 1868-72 he was professor of botany in the University of Vienna. He made an elaborate study of the palms and flora of the United States of Colombia, and published such works as *Die Vegetationsorgane der Palmen* (1848); *Flora Columbiae terrarumque adjacentium*, etc. (1857-69); *Chesismus der Pflanzenzelle* (1870); *Zur Geschichte der Botanik* (1870), and *Deutsche Flora, pharmazeutisch-medizinische Botanik* (1883).

KAUFMANN, RICHARD VON. A German economist, died on March 12, 1908. He was born in Cologne on Mar. 29, 1850, was educated at the Universities of Bonn, Heidelberg and Berlin, and at first engaged in banking in Berlin. In 1879 he became *privat-docent*, teaching economics in the University of Berlin, and in the same year professor of that subject in the technical college at Aix-la-Chapelle. In 1883 he was connected with the Finance Ministry, and he was one of the experts in finance and economics summoned by Chancellor von Caprivi to give an estimate of the economic resources of Germany at the time the Chancellor's Army Bill was under consideration. His *Die Eisenbahnpolitik Frankreichs* (1896; French translation, 1900) is an important study of the French plan for the State purchase of railroads; his other publications include; *Die Finanzen Frankreichs* (1882, French translation, 1884); *Die Reform der Handels- und Gewerbebekammern* (1883); and *Die öffentlichen Ausgaben der grösseren europäischen Länder nach ihre Zweckbestimmung* (3d ed. 1893). He was also a student of archaeology, and suggested and took part in excavations in northern Syria, Asia Minor and Egypt. At his home in Berlin he had gathered a very important collection representing sixteenth century Italian art.

KEDAH. A State of the Malay Peninsula under the suzerainty of Siam. The first administration report, published in 1907, contains

the following particulars. Area, 3045 square miles; population, about 219,000, mostly Malays, and some Chinese. Alor Star, the capital, has been much improved recently and has the appearance of a prosperous town. The mineral wealth is unknown. The forests are poor. The soil is rich and well watered. Paddy and rice, the principal products, are exported in large quantities. This is noteworthy, as nearly all the other States in the peninsula have to import rice. Considerable land is planted in tapioca. This crop is destructive to the soil, and it has now been arranged that some other crops must be planted with the tapioca in such quantities as to insure that the land shall not be abandoned after three or four years of tapioca growing to an injurious growth ofalang grass. In the Yen district, around the foot of Kedah Peak, coffee and pepper are produced in small quantities. The soil is considered good for rubber, for the planting of which concessions have been granted. Cocoanuts are not produced to any great extent for export. Two steamers run daily between Alor Star and Penang, in the Straits Settlements, and the river is thronged with traffic. The immediate government is by a native Rajah, who is assisted by an English Financial Adviser appointed by the Siamese government. There is a police force of Malays and Sikhs.

KEEFE, DANIEL J. An American labor leader, appointed Commissioner-General of Immigration in December, 1908. He was born near Chicago, Ill., in 1855, and while still in his teens became a "lumber shover" on the Chicago docks. His courage and physical strength soon made him the recognized leader of the dock laborers, and in 1882 he succeeded in banding them together in an organization known as the Chicago Vessel Unloaders' Union, of which he was president for twenty years. After the Chicago union was formed, he found that in order to have an effective union the dock laborers at other Lake ports should also be organized, and in 1892 he established a national organization at Detroit. In 1896 he was appointed a member of the Illinois State Board of Arbitration, of which he was chairman until 1901. He was for some time sixth vice-president of the American Federation of Labor, being the only vice-president of that body, during the Taft-Bryan campaign, who refused to indorse the stand of President Gompers in opposition to Taft's candidacy. This action on his part was used by both the Republican and Democratic parties, the former citing the instance as proof that Mr. Taft was not regarded by all labor leaders as hostile to labor, and the latter charging that Mr. Keefe expected to receive a reward from the Administration in return for his support of Mr. Taft. Mr. Keefe denied the charge, maintaining that he had always been a Republican in politics. In December, 1908, he was appointed by President Roosevelt Commissioner-General of Immigration to succeed Frank P. Sargent.

KELANTAN AND TRINGANU. Two States in the Malay Peninsula, formerly under Siamese suzerainty, ceded to Great Britain in 1908. They lie adjacent to the States of Perak and Pahang, in the Federated Malay States, and were defined as within the British sphere of influence by the Franco-Siamese treaty of 1906.

KELANTAN has an area of 5500 square miles and a population of 300,000, mostly mixed Malays and Siamese, besides 8000 Chinese and 40 Europeans. There are 10,000 aborigines, Sakeis and Jakuns, inhabiting the mountain fastnesses to the south. The established religion is Shafi Mohammedanism, its priests being supported by a system of tithes. There are 40 Buddhist monasteries. Kata Bharu, the capital and sole town of Kelantan, on the Kelantan River, is situated eight miles from the river's mouth. There are seven important villages, with populations ranging from 500 to 4000. The chief exports are copra, gold, betelnuts, paddy, rice, cattle, sheep, pigs, and dried fish. Minor exports are wild rubber, gutta-percha, hides, silk goods, and poultry. The State is believed to be rich in gold and tin. The area under cultivation by natives embraces 450,000 acres. About 21,700 acres have been taken up for coconut and rubber plantations, largely by the Duff Development Company, which is said to own a concession of 2500 square miles, mostly in the hilly and mineral district. The only roads in the State are 4 roads stretching from the capital to a distance of 4, 6, 8, and 30 miles respectively, the last-mentioned extending to the border of Tringanu. The rivers—the Kelantan in the centre, running northward; the Semarak, running east of the Kelantan; and the Golok, west of the Kelantan—and their tributaries constitute the highways of the State. A privately owned steamer, subsidized by the government, carries mails and passengers 50 miles up the Kelantan. There are weekly mails to Bangkok, capital of Siam, and Singapore, Straits Settlements. Telegraphs connect with Bangkok and Pahang. A telephone extends from the capital to a village at the mouth of the Kelantan. The State is ruled by a Rajah, who is assisted by a British Adviser. A company of Sikhs constitutes the police force.

TRINGANU, with an area of about 2500 square miles, is practically unknown. There are no roads, and the principal river, the Tringanu, is rendered useless to navigation half-way on its course to the sea by a series of large waterfalls. Tin is known to exist in the south of the State.

KENNEDY, CHARLES RANN. An English playwright. See **DRAMA**.

KENTUCKY. One of the South Central Division of the United States. Its total area is 40,598 square miles. The population in 1908, according to Federal estimate, was 2,378,000.

MINERAL RESOURCES. The most important of the mineral resources of the State is coal, in the mining of which there has been a record of uninterrupted growth. The production in 1907 was 10,753,124 short tons, with a spot value of \$11,405,038. This production is an increase of 11.39 per cent. in quantity and 16.26 per cent. in value over the production and value of coal in 1906. The increase would have been even greater but for the extraordinary weather conditions that prevailed during November and December, which prevented the usual demand for local consumption. The coal mines in 1907 gave employment to 16,971 men, against 15,272 men in 1906. About two-thirds of the mines of the State were operated on the open shop or non-union basis, and in consequence the eight-hour day is not so generally observed as in some of the other coal-mining States. Kentucky is one of the foremost coal-producing States in the use of undercutting machines. In 1907 there

were 708 of these machines in operation, as compared with 600 in 1906 and 527 in 1905. There were 32 men killed in the coal mines of Kentucky in 1907. According to the estimates of the United States Geological Survey the original coal supply of the States was 124,028,000,000 short tons, from which there had been mined at the beginning of 1908 122,400,000 tons. There were 127,956 tons of pig iron produced in 1907, as compared with 98,127 in 1906 and 63,735 in 1905. The value of the clay products produced in the State in 1907 was \$2,611,364, as compared with a value of \$2,592,423 in 1906. Kentucky ranks second in the output of bituminous rock. The products of crude oil in Kentucky (including Tennessee) showed a decrease from 1,213,548 barrels in 1906 to 820,844 barrels in 1907. The State is a large producer of mineral water. In 1907 736,920 gallons, valued at \$72,373, were produced. Among other mineral products of the State are barytes, cement, lead, lime, sand, gravel, building-stone, and zinc, also small quantities of infusorial earth, iron ores, ochre, and sand-lime brick. According to figures of the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$19,294,341 as compared with a value in 1906 of \$18,758,897. Although a number of new plants were opened and began shipping coal in the State during 1908, the production from some of the older mines was so reduced that the total output of the year fell off between 15 and 18 per cent. as compared with 1907. The exceptionally warm weather that prevailed during the fall decreased the usual demand for domestic consumption.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 84,823,000 bushels, valued at \$55,135,000 from 3,366,000 acres; winter wheat, 8,793,000 bushels, valued at \$8,617,000 from 758,000 acres; oats, 2,803,000 bushels, valued at \$1,514,000 from 173,000 acres; barley, 25,000 bushels, valued at \$18,000 from 1,000 acres; rye, 176,000 bushels, valued at \$150,000 from 13,000 acres; potatoes, 2,356,000 bushels, valued at \$908,000 from 38,000 acres; hay, 675,000 tons, valued at \$7,425,000 from 500,000 acres; tobacco, 195,600,000 pounds, valued at \$17,779,600 from 240,000 acres. The production of tobacco in 1908 decreased from 240,278,000 pounds in 1907, as a result largely of the struggle carried on by the tobacco growers against the American Tobacco Company. (See paragraphs below, and TOBACCO.) The corn crop decreased from 93,060,000 bushels in 1907; wheat, from 8,808,000 bushels in 1907. The production of oats suffered a decrease from 3,379,000 bushels in 1907. Both in the production and value of tobacco, Kentucky ranks first, the value of production being twice as great as that of North Carolina, which occupies second rank. It forms more than one-third the total for the entire country. The farm animals on Jan. 1, 1909, were estimated as follows: Horses, 399,000; mules, 207,000; dairy cows, 402,000; other cattle, 200,000; sheep, 1,071,000; swine, 1,236,000. Since 1900 there has been a decrease of about 14 per cent. in the number of horses and of 35 per cent. in the number of swine, but an increase of 50 per cent. in the number of sheep.

The wool clipped in 1908 was 3,000,000 pounds, valued at \$823,000.

MANUFACTURES. The census of 1905, covering establishments classed as factories, showed \$147,282,478 capital, 59,794 wage-earners, and products valued at \$159,753,968, these figures being increases over those for 1900 of 67.4, 15.6, and 26.3 per cent. respectively. The value of products of leading industries in 1905, and, in parentheses, the per cent. of increase over 1900, were Flour and grist mill products, \$18,007,700 (38.3); lumber and timber products, \$14,539,000 (9); chewing and smoking tobacco and snuff, \$13,117,000 (12.3 per cent. decrease); distilled liquors, \$11,204,649 (14.5).

EDUCATION. The number of pupils enrolled in the schools of Kentucky in 1908 was 501,428, which was 22.48 per cent. of the population. The average attendance was 309,836, and the number of teachers was 9245. An attempt has been made in the last two years to abolish the district system, which is now maintained in only two Southern States, Kentucky and Arkansas, and substitute therefor the county system. A bill was introduced into the Legislature of 1907 abolishing the office of school trustees and establishing county boards of education. This bill passed the House, but was not acted upon by the Senate. A great want in the school system of the State is for rural high schools, which, in other States, are encouraged by legislation.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State are the asylums for the insane at Lakeland, Hopkinsville, and Lexington; the Institution for the Feeble-Minded at Frankfort. There are State prisons at Frankfort and Eddyville. The Legislature of 1907 amended the act of 1906 creating the Kentucky State Board of Control for Charitable Institutions, making it a bi-partisan board of four members, two members from each of the two political parties which polled the largest number of votes for the last preceding election. Members are appointed for a term of four years by the Governor. The expenditures for charities and corrections for 1907 aggregate \$541,132. The State also maintains the Kentucky Institute for Feeble-Minded Children, in which were 173 pupils in 1907; the Kentucky School for the Deaf with an enrollment in 1907 of 378; and the Kentucky Institute for the Education of the Blind.

POLITICS AND GOVERNMENT. The most notable event in the political history of Kentucky in 1908 was the election of a Republican Senator, ex-Gov. William O. Bradley, to succeed James B. McCreary for the term beginning March 4, 1909. From Jan. 1 to Feb. 28, the Legislature was engaged in a deadlock over this election. Gov. J. C. W. Beckham, who was the leading Democratic candidate for the office, lacked, up to the end of the voting, four votes of election. The election of Mr. Bradley was due to the assistance of four Democrats who were opposed to Beckham. In the final vote Bradley received 65 votes. Mr. Bradley is the only Republican who has served a term as Governor of Kentucky since it became a State, and he has long been prominent in local and national Republican politics. In March the Legislature passed an anti-pool room bill, which became effective on June 15. Under the provisions of this bill, any telephone or telegraph company owning property rented for pool-room purposes, personally conducting a pool

room, or working in a pool room, is liable to a fine of not less than \$1000 or more than \$5000 and six months' imprisonment in jail. Considerable difficulty arose over the enforcement of this law at Latonia during the end of October and early weeks of November. The race-track people refused to recognize the ruling of the State Racing Commission, and the latter body revoked their license. Notwithstanding this action, the racing was continued, and the Jockey Club secured a temporary injunction from the Kenton County Circuit Court preventing interference from the State Racing Commission. This matter is still under consideration by the court. The Legislature on March 6 passed a bill providing a fine for any one who violates an agreement to pool tobacco. This was an attempt to end night riding in the State. (See below.) The Monarch Tobacco Company of Louisville on July 31 filed a suit in the Federal Court for \$1,500,000 damages against the American Tobacco Company, the Nail and Williams Tobacco Company and the Mengel Box Company, alleging that their trade had been ruined through the practices of the defendant companies. It was alleged also among other things that the trust coerced jobbers and refused in many instances to sell them tobacco unless they refrained from selling independent brands; also that retailers were induced through premiums and other devices to neglect the sale of independent products.

For an account of child labor enactments in 1908 see CHILD LABOR.

NIGHT RIDERS. For the greater part of the year certain sections of the State were kept in terror by the depredations of so-called "Night Riders," alleged to be representatives of the American Society of Equity, organized to control the price of tobacco. These attacks were directed against independent tobacco growers who refused to enter the pool organized to compel the American Tobacco Company to pay certain rates for tobacco in these sections. The result was depicted by Gov. Willson in his annual message to the Legislature in January, 1908: "Our tobacco is nearly destroyed; large customers are being taught that it is safer and better to buy elsewhere. Large crops remain unsold. Managers who have been promised large prices for pooled crops above the market price have seen the buyers driven from the field, and no one can tell when the end will come, but everyone can see that the result up to this time is that our markets, not only for tobacco, but for other products, are paralyzed, and in many cases ruined; that in large districts the law has been wholly overthrown, and the poor people, who have no one to take care of them, are deprived of the protection of the people's laws, and have lost their liberty and are helpless." On Jan. 3, Gov. Willson issued a proclamation in which he offered a reward of \$500 for the conviction of any person implicated in the raids of the "night riders" in the dark-tobacco belt. This action was the result of a raid made upon the town of Russellville on Dec. 27, 1907; two warehouses and several other buildings were burned and four persons seriously injured by the raiders. On Jan. 7, the "night riders" visited the towns of Sherburne and Bethel. In the latter place an independent warehouse and a general store were burned, and at Sherburne an independent warehouse was destroyed. On Jan. 8, in anticipation of an attack of a body of "night riders," two gatling guns with about 100 men guarded

six large tobacco warehouses. The gatlings were used also as a defence in Frankfort against possible attacks. On Jan. 21 a large tobacco barn was burned near Hopkinsville. At Dycusburg on Feb. 4, 200 masked "night riders" burned a large tobacco house and distillery, causing a loss of about \$40,000. A member of the firm owning the warehouses was taken from his home, tied to a tree and severely whipped. On Feb. 9, another body of "night riders" visited Fredonia, near Hopkinsville, where they blew up a tobacco factory containing 35,000 pounds of tobacco, and burned a barn containing 10,000 pounds. The damage aggregated \$10,000. On Feb. 16, County Judge Crumbaugh and nine tobacco buyers living at Eddyville were taken from their homes by 200 masked "night riders," lashed to a post, and severely beaten. Judge Crumbaugh had made a speech denouncing the Dycusburg raid and demanding an investigation. On Feb. 21, the Law and Order League of Hopkinsville and Christian County presented a memorial to the General Assembly, calling for prompt and vigorous action. This memorial recited that in the city of Hopkinsville alone over \$50,000 worth of buildings had been destroyed, entailing a total loss upon innocent persons in no way connected with the tobacco trade. It was further declared that in half-a-dozen or more counties law-abiding citizens had been dragged from their homes at night and brutally beaten. The memorial called upon the Assembly for aid for the citizens of the community. On Feb. 26, Gov. Willson sent a message to the Legislature urging prompt legislation against the "night riders," and declaring that law enforcement was paralyzed and that a rigid measure was vital to the liberty of the people. He recommended the appropriation of \$25,000 for the prosecution of the "night riders," declaring that only one alleged offender had been indicted and none convicted. He asked for additional power from the Attorney-General in cases where it appeared that the local authorities were likely to fail from any cause to prosecute faithfully. On Mar. 21, a band of masked "night riders" shot and killed Harlan Hedges, an independent tobacco farmer, 7 miles northwest of Carlisle. This was the first invasion by this band of the Blue Grass regions of Kentucky. On April 3, Calloway County, in the heart of the black-tobacco regions, was placed under martial law. The county was declared by authorities to be in a state of anarchy. On April 20, Gov. Willson ordered additional troops to the scene of these outrages. On May 13, Robert H. Hollowell, who sued his brother, John E. Hollowell, and 27 other suspected "night riders" of Caldwell County, received a verdict of \$35,000 damages on account of his having been driven from the State with his family. "Night riders" again visited the vicinity of Hopkinsville on July 22 and burned the station houses of the Illinois Central Railway at Gracey in Christian County; at Cerulean, in Trigg County, and at Otter Pond, in Caldwell County. The railroad company had given the militia authority to camp on its property, and this action had aroused bitter feeling among the "night riders." Following this came other threats of the destruction of the property of the railway, and the company requested the militia to vacate its property. The Governor refused to accede to this request, insisting that the troops had a right to camp on the railroad property, or any other property for which they paid a compensation. The reign of lawlessness con-

tinued throughout the State during the summer and early months of autumn. On October 12, as the result of the murder of a tobacco farmer in Hickman County, together with his wife and two children, Gov. Willson made an extreme appeal to the people of the State to put an end to these outrages. He said: "This crime is the outgrowth and the logical result of the operation of the night riders' crimes in the State. It is only one remove from civil war, and the safety of our institutions and what we have of civilization is involved, and the only salvation for the name and honor and character of Kentucky is for the whole people to rise up in their might to save their liberty, uphold their law and mercilessly put down murder, arson, intimidation and proscription wherever they dare show themselves." The Governor called upon the people to assemble in their respective neighborhoods and "to take strong, prompt and effective measures to punish every cowardly scoundrel who rides the roads to threaten his neighbors." In November an arrangement was made between the American Society of Equity and the American Tobacco Company, whereby the latter was to buy tobacco at the rates insisted on by the associated growers. This action put an end to these troubles. (See TOBACCO.)

CONVENTIONS AND ELECTIONS. The Democratic State Convention met on June 11. The delegates selected were instructed to vote for William J. Bryan as President. The Republican State Convention met at Louisville on May 7, and adopted resolutions binding the delegates in the National Convention to vote for William H. Taft. As the result of dissensions in the convention, 22 of the 26 votes were cast for Mr. Taft, and the remaining two were contested. In the election of Nov. 3, the State was carried by William J. Bryan by about 8,000 plurality, the vote being: Bryan, 244,092; Taft, 235,711; Chafin, 5887; Debs, 4060.

OTHER EVENTS. Caleb Powers, former Secretary of State, who had been under arrest and imprisonment, as an accessory in the murder of William Goebel, the Democratic candidate for Governor who was declared elected in 1903, was pardoned by Gov. Willson on May 3. Powers had been tried four times. The result of the fourth and last trial in 1907 was a disagreement of the jury. James Howard, who was also under arrest for the same murder, was also pardoned. Judge James Hargis, for years one of the central figures in the famous Hargis-Cockrill feud, a leading local politician, was killed on Feb. 6 by his son, Beauchamp Hargis. In the trial of the case the jury failed on Dec. 26 to agree on a verdict and was discharged. On Feb. 10, nine men were killed as the result of an explosion of gas in the mine of the Moody Coal Company at South Carrollton.

In the latter part of December trouble broke out in the town of Stearns as the result of a strike among miners. The trouble grew out of the strikers violating the injunction granted several months previous by Federal Judge Cochran to the Stearns Coal and Lumber Company, ordering the miners not to interfere with non-union labor. The miners resisted the attempts of the United States marshals to arrest several among their numbers. The town was placed under martial law Dec. 27.

In a battle between illicit distillers and a posse of revenue officers on the Kentucky and West

Virginia border on Dec. 5, a deputy sheriff and Ben Vinson, a noted outlaw, were killed.

LEGISLATION. Among the important measures enacted at the legislative session of 1908 were the following: A child labor law was enacted, which will be found described in the article CHILD LABOR. An act was passed also which makes attendance upon schools by children between seven and fourteen years of age, in cities of certain classes, compulsory, unless they are taught privately or have acquired the common school advantages of instruction. A pure food law was enacted as well as measures providing for the encouragement of the establishment of a tuberculosis sanitarium. An important measure was passed, authorizing tobacco pooling, which was made necessary by the disturbances caused by the "Night Riders." (See above.)

STATE OFFICES. Governor, A. E. Willson; Lieutenant-Governor, W. H. Cox; Secretary of State, Ben H. Bruner; Treasurer, Edwin Farley; Auditor, Frank P. James; Attorney-General, J. B. Breathitt; Superintendent of Education, John G. Crabbe; Commissioner of Agriculture, M. C. Rankin—all Republicans.

JUDICIARY. Court of Appeals: Chief Justice, Ed. C. O'Rear, Rep.; Justices, W. E. Settle, Dem.; H. S. Barker, Dem.; Thomas J. Nunn, Dem.; John M. Lassing, Dem.; John D. Carroll, Dem.; J. P. Hobson, Dem.; Clerk, Napier Adams, Rep.

The State Legislature of 1908 was composed of 22 Democrats and 16 Republicans in the Senate, 51 Democrats and 49 Republicans in the House. The State representation in Congress will be found in the article UNITED STATES, under the section Congress.

KERN, JOHN WORTH. An American politician, Democratic candidate for Vice-President in 1908. He was born in Howard County, Ind., on Dec. 20, 1849, graduated at the University of Michigan in 1869; and was Supreme Court reporter of Indiana from 1885 to 1889. In 1892-96 he was a State Senator, and in the following year he was chosen City Attorney of Indianapolis. In 1900 and again in 1904 he was the unsuccessful nominee for Governor on the Democratic ticket. He also received the complimentary vote of the Democratic minority in the Legislature of 1905 for United States Senator. At the Democratic National Convention, held in Denver in July, 1908, he was nominated for Vice-President. After the election of 1908, when a Democratic majority in the Legislature was assured, he was prominently mentioned for the United States Senatorship. (See PRESIDENTIAL CAMPAIGN.)

KIAMIL PASHA. TURKISH GRAND VIZIER, See TURKEY.

KIAO-CHAU, or KIAO-CHOW. A harbor, town, and district on the east coast of the province of Shantung, China, leased to Germany for a period of 99 years from Mar. 6, 1898. Area of the district, exclusive of the bay, 193 square miles; population, 120,000. There are about 5000 Europeans. The German sphere of influence extends 31 miles beyond high-water mark, embracing 2500 square miles of area and a population of 1,200,000. Tsingtau, with the best harbor on the coast, is the capital; in 1907 it had a population of 31,509 (1484 Europeans). It is a modern city, with macadamized streets, water-works, electric lighting, churches, schools

for Germans and Chinese, hospitals, hotels, post office, market halls, a slaughter-house, etc. In Dec., 1908, it was announced that the German government intended to establish a commercial high school as a basis for technical and medical schools, to be followed later by schools for political economy, forestry, and agriculture. The Chinese government had expressed its readiness to support the new school with a subsidy and to admit the graduates to examinations for State positions. Acacias have been extensively planted on the bare hills, and in the winter of 1907-8 acacias planted in 1902 and 1903 were cut for the first time and sold to the Shantung Mining Company for mining timber. This company works coal mines at Fangtse and Poshan, and iron mines at Tchin-ling-chen. (See CHINA.) A railway of 247 miles runs from Tsingtau to Tsinan, the capital of Shantung, with a branch line of 30 miles to Poshan. The railway is under the same management as the mining company, which owns mining areas within a ten-mile zone on both sides of the railway. The port is included within the Chinese Imperial Customs. The imports and exports in 1907 amounted to 16,416,053 and 8,478,325 Haikwan taels respectively. The administration is by a Governor under the German Navy Department. The budget for 1908-9 balanced at 11,465,753 marks, of which 9,739,953 was an Imperial subvention.

KIELHORN, LORENZ FRANZ. A German Sanskrit scholar, died in March, 1908. He was born at Osnabrück, was educated at Göttingen, Breslau, Berlin, Oxford and London, in 1866-81 was professor of Sanskrit in the Deccan College at Poona, and in 1882 became a member of the faculty at Göttingen. His publications include *Ātmanavas Phitsutra*, with translation (1864); A Sanskrit grammar (1870, 4th ed. 1896); *Kāṭyāni and Patanjali* (1876); and a *Report on the Search of Sanskrit Manuscripts* (1881). Upon the death of Bühler he became editor of the *Grundrisses der indo-arischen Philologie*. In 1903, with Prof. F. Schmidt, of Berlin, he was sent by Emperor William to Oxford as a representative of the German Education Office in the matter of the German Rhodes scholarships.

KINGSTON, CHARLES CAMERON. An Australian statesman, died on May 11, 1908. He was born in Adelaide, on Oct. 22, 1850, was educated at the Adelaide Educational Institute, was admitted to the bar in 1873, and became a Queen's Councillor in 1889. In 1881 he was elected to the Assembly for West Adelaide. He has been five times reelected, and since 1901 had been a member of the Commonwealth House of Representatives. He had served as Attorney-General (three times), and as Chief Secretary (1892); was Premier from 1893 to 1899—twice as long as any previous ministry had held office—and had also served as Minister of Trade and Commerce (1901-03). He advocated the adoption of a protective tariff, opposed Chinese immigration and drafted the bill for its regulation (agreed to, in 1888, by all of the colonies excepting Tasmania), and presided over the Australian Federal Convention, in 1897-8, which formulated the bill establishing the Australian Commonwealth. He also urged woman's suffrage, industrial conciliation, and the adoption of a system of land and income taxation, and death duties.

KITES. See METEOROLOGY.

KNAPP, WILLIAM IRELAND. An American educator and author, died on Dec. 11, 1908. He was born at Greenport, L. I., on March 10, 1835, and graduated at Colgate (then Madison College) in 1860. He was professor of modern languages at Madison in 1860-65, and at Vassar in 1866-68. During the period 1869-80 he traveled extensively through Spain. In 1881 he was appointed professor of modern languages at Yale, and in 1892 took the same chair at the University of Chicago, where he remained until 1895. Retiring from active teaching, he went abroad and lived in England and France. He was an authority on Spanish literature and history. Among his publications are: *Spanish Grammar* (1882); and *Borrow's Lavengro and the Romany Rye* (1900).

KNOWLES, Sir JAMES. An English editor, died on Feb. 13, 1908. He was born on Oct. 13, 1831, the son of an architect, was educated in that profession at University College, and practised it, in his father's office, with considerable success. In 1867 he met, and thereafter became an intimate friend of Tennyson, for whom he designed "Aldworth," the poet's home in Blackdown. He founded in 1869 the Metaphysical Society, which was composed of the most distinguished representatives of religion and science. In 1870 Knowles became editor of the *Contemporary Review*, which he conducted until 1877, in which year he established the *Nineteenth Century*, changed in 1901 to the *Nineteenth Century and After*, of which he was editor during the remainder of his life.

KNOX, PHILANDER CHASE. United States Senator (Republican) from Pennsylvania. He was born in Brownville, Pa., on May 6, 1853, graduated at Mount Union College, Ohio, in 1872, and three years later was admitted to the bar. From 1876 to 1877 he was United States District Attorney for the Western Pennsylvania District, and in 1901 was appointed United States Attorney-General by President McKinley. He was continued in office by President Roosevelt. Under Mr. Knox's administration, the Beef Trust was put under injunctions, the officers of the railways engaged in the cotton-carrying pool were indicted and forced to abandon their combination, and the "merger" of the Northern Securities Company, which threatened to destroy traffic competition in the Northwest, was dissolved. He showed great skill in dealing with the legal problems arising from the acquisition of the Panama Canal, and he outlined and recommended the laws which effected the establishment of the Department of Commerce and Labor. In 1905 Mr. Knox was elected United States Senator from Pennsylvania. The ability Mr. Knox had shown while in the government service caused him to be prominently mentioned for the Republican nomination for President, and in the National Convention he received 68 votes, of which 64 were from his own State and 4 from New Jersey. In Dec., 1908, Mr. Knox was asked by President-elect Taft to become Secretary of State in the latter's Cabinet, and accepted. Mr. Knox received the degree of LL.D. from the University of Pennsylvania in 1905, and from Yale in 1907.

KONGO. See CONGO.

KOREA. A peninsula of eastern Asia, a protectorate of Japan. Area, 84,420 square miles; population (1906), 9,781,671. Of foreigners there were, in 1907, 98,495 Japanese, 3661

Chinese, 286 Americans, 138 British, 103 French, 54 Germans, and 48 other Europeans. Seoul, the capital, had 193,606 inhabitants in 1902. Ping-Yang has 40,000 inhabitants; Suwon, 11,000 (1000 Japanese); Fusan, 81,700; Chemulpo, 46,100; Massampo, 57,600; Wiju, 52,700.

PRODUCTION. Gold veins are found over the entire country. The most important gold mines, situated in the Unsan district, in northwestern Korea, yielded \$1,150,000 worth of bullion in 1907. They are owned by an American company. In 1908 the Americans also secured possession of the Kapsan copper mines, in northeastern Korea, and of graphite mines in the southeast. Italian, German, French, and Japanese interests are engaged in developing copper, gold, iron, and graphite mines. Petroleum was discovered in 1908 and a concession was granted. Lead and silver deposits await exploitation.

The agricultural products include millet, barley, oats, and beans in the north, and rice, wheat, tobacco and cotton in the south. Cotton culture is improving, owing to the efforts of the Cotton Plantation Association of Korea and of the model farm and agricultural college. The latter is situated at Suwon, 25 miles from Seoul. It was initiated by the Japanese, but was later transferred to the Korean government. About 212 acres are used for experimenting purposes, and the annual appropriation for the institution is about \$44,000. Methods of agriculture are improving under the influence and example of Japanese settlers. The rice crop of 1908 was estimated in September to exceed the average crop by 30 per cent. Whaling and fishing along the coast are carried on by the Japanese. In 1908 a factory was planned by a number of Koreans for dyeing, weaving, embroidery, carpentry, and smithing. The Japanese government organized in 1908 the Far Eastern Colonization Company, with a capital of 10,000,000 yen (1 yen=49.3 cents), for the purpose of furthering Japanese settlement in Korea. The Company may also engage in mining, manufacturing, etc. Shareholders are limited to Japanese and Koreans, and a number of shares were taken by the Japanese and Korean imperial houses. The company is to receive a government subsidy of 300,000 yen annually for eight years.

COMMERCE AND COMMUNICATIONS. The imports of foreign goods and exports of native produce in 1907 amounted to 41,387,540 and 16,473,834 yen respectively, against 30,291,322 and 8,132,844 in 1906. The principal imports were cotton goods, woollens, metal goods, railway materials, silk piece goods, timber, and machinery. The principal exports were valued in 1907 as follows, in yen: Rice, 7,558,505; beans and peas, 3,935,632; red ginseng, 1,200,066; gold, 4,359,000. Other exports were: Cattle, hides and skins, timber, wheat, coal, copper, raw cotton, paper, fish, etc. The trade is principally with Japan, followed by China, Great Britain, and the United States. There are over 688 miles of railway and 2872 miles of telegraph line, both being owned by the Japanese government. The shipping entered and cleared in 1907 aggregated 4,088,671 tons, mostly Japanese. The improvement of the harbors is steadily progressing. The old Korean nickel coinage is slowly giving place to the Japanese.

GOVERNMENT, FINANCE, ETC. The Emperor Yi Chōk, born Mar. 25, 1874, ascended the throne

on the abdication of his father, July 19, 1907. The real power in the country is the Japanese Resident General—in 1908, Prince Ito. The native army has been disbanded, excepting one battalion of Imperial Guards. A Japanese garrison is permanently stationed, and the reorganized police force contains a large number of Japanese. A completely independent judiciary was established in 1908 by the Japanese, and new codes were in process of preparation. The budget for 1908 estimated the revenue at 20,286,732 and the expenditure at 20,296,073 yen respectively; for 1909 there were 21,434,733 and 22,268,655 yen respectively. The revenue from import duties amounted in 1907 to 2,319,259 yen; from export duties, 758,754 yen. The public debt stood on Feb. 1, 1908, at 12,333,968 yen, besides 2,000,000 yen of treasury notes.

ARMY. The 13th division of the Japanese army reinforced by the 12th brigade of infantry and 4 squadrons of cavalry occupied Korea during the year 1908, with headquarters at Seoul.

HISTORY.

It will be recalled that the protests of Korean delegates in 1907 at The Hague against the Japanese violation of Korean independence were in vain and that no attention was paid to the denunciations by the Korean prince of the cruelties committed by the Japanese in his country. In the Palace revolution of July, 1907, the occasion of some serious street-fighting, the Emperor was forced to resign by his own ministers at the instance of the Japanese. The imperial seal was now transferred to his son (July 19) and the Palace was occupied by Japanese troops. No European nation was willing to interfere, believing that in the "decrepitude and disorganization" of the Korean government it would be unwise to deprive Korea of Japanese tutelage. Prince Tyong-oui-Yi stated his country's grievances in a vigorous document. He said that if Japan complained of the action of the Californians, Korea might complain with equal force of the action of Japan. Korean students in Japan were not admitted to the same schools as the natives but into separate schools of an inferior class. At home they had to endure the insolence of a low class of Japanese immigrants. There was not a village, he said, that could not cite outrages of the Japanese upon the inhabitants, often upon women and children. These complaints were of no avail. The Japanese forces in Korea were reinforced. The new Emperor at the instance of Prince Ito ordered the punishment of The Hague envoys and of men of his father's court suspected of fostering resistance. Japanese artillery was stationed in the Palace courtyard and the patrols in Seoul were increased. By the new Japanese-Korean convention signed July 25, 1907, the Korean administration was placed under a Japanese Resident General, whose approval was required for every law and decree dealing with important affairs of state, for the nomination of officials and for the employment of foreigners; a distinct line was drawn between administrative and judicial affairs; and the clause of the convention of Aug. 22, 1904, providing for a financial adviser was annulled. Henceforth Prince Ito was the real ruler. The young heir to the throne was sent to Japan to be educated. In Japan and in Europe generally it was now thought that

the possession of the country was assured, and that the Koreans would prove docile.

KOREAN OPPOSITION. The Japanese colonization of Korea continued in 1908. The Palace revolution of the previous year had started unorganized efforts at resistance, and during 1908 the tax collections were far smaller than in the previous year, and threatened to cause a considerable deficit. Plots against Japanese functionaries were also reported in the Japanese papers as, for example, the attempted derailment of Prince Ito's train at the end of April. But the main resistance showed itself in a scattering guerilla warfare, about which little definite could be learned, owing to lack of trustworthy information. Bands of two or three hundred marauders appeared at various points, especially in the mountains, acting without concerted plan, and subsisting, no one knew how, but seeming everywhere to be well armed and in some instances having cannons. Out of the thirteen provinces, six were apparently in a permanent state of revolt. The reports of engagements between the Japanese and these insurgents which appeared in Japanese journals represented the conflicts as frequent and sanguinary, but generally placed the enemy's loss at ten or twenty times that of the Japanese. Thus they reported that 53 of these conflicts took place in May with a loss of 500 Koreans and only about 20 Japanese. Some of the engagements were said to have lasted four or five hours. In some Japanese quarters it was admitted to be a real national movement, but the press generally declared that the insurgents had been gradually scattered and were hardly more than groups of bandits. There were, however, signs in the later months of the year that the revolt was by no means put down.

ALLEGED KOREAN GRIEVANCES. One of the Japanese journals attributed the bad temper of the Koreans to the excesses of the soldiers and the treatment of the Koreans as an inferior race. Critics of Japan's policy agreed in this view. The Japanese press referred frequently to the Koreans as a people but little removed from savagery and declared that any measures were justified against the "bandits." Prominent Japanese officials called them a degenerate race. Recent writers on Korea have remarked on the violence and injustice of the Japanese, and it has even been said that on account of the depredations of Japanese agents, Korea has profited nothing from her change of masters. Among the specific grievances alleged, the following may be mentioned: Corrupt and negligent local administration of justice, and inactivity of Japanese police against Japanese malefactors; issuance of paper money in Korea far in excess of legal limit; expropriation of lands of frequent occurrence, as, for example, the confiscation by the Ministry of Marine of a strip of land behind Port Lazareff; the fear that the corvée will be established in Korea as demanded by some Japanese newspapers and that the natives will eventually become serfs upon their lands; the increase of Japanese troops (new regiments were sent to Korea in 1908) and of Japanese functionaries; the suppression of Korean journals. To reassure the people who feared that the Japanese would seize all the land and appropriate all the offices, a force of 4,000 gendarmes was organized from among the Koreans themselves, many of the recruits being ex-rebels. As to

the judiciary, radical reforms were undertaken by the Japanese. A codification of the laws was completed under Professor Ume and an organization of the judiciary undertaken. Arrangements were made for new law courts with Japanese experts on the bench. In June it was announced that the imperial assets had been transferred to the national treasury, thus removing the means which they had previously afforded of supporting court parasites and political intrigues.

THE NATIVE PRESS. That the spirit of independence still lingered, appeared from the repressive measures which the Japanese authorities thought it necessary to enforce against the press. A press law was promulgated in the latter part of April whereby the sale of any paper containing matter subversive of the public peace was forbidden under penalty of fine or imprisonment. Almost immediately (May 1) a Korean paper (the *Daihan*) was suppressed for publishing an appeal to the natives to shake off their apathy and struggle for their independence, calling to their minds the examples of Mazzini and Washington. It was controlled by a British subject named Bethel, the proprietor of the *Korean Daily News*, and other pro-Korean journals which assumed to be extra-territorial and therefore exempt. The government, however, after negotiations with the British authorities, had an action brought against Bethel for the suppression of the *Daily News* under the Order in Council forbidding any British subject to publish articles offensive to the Korean government. At the time it was found that the *Daily News* had already suspended publication. Six other Korean papers were suppressed on May 6, and another on May 27. Meanwhile, on May 21, the Resident General forbade any journal to publish anything about the suppression of the insurrection.

KRETSCHMER, EDMUND. A German composer, organist and conductor, died on Sept. 14, 1908. He was born in Saxony, in 1830, and received his musical education at the Dresden Conservatory. In 1854 he was organist of the Catholic church in Dresden, and in 1863 was appointed court organist to the King of Saxony. A mass composed by him was awarded a prize at the international competition held at Brussels in 1868. He was the organizer and conductor of several choral societies. His compositions include three operas (*Die Folkunger*, 1874; *Heinrich der Löwe*, 1877; *Schön Rotraut* 1887), suites and miscellaneous instrumental pieces, and several masses.

KWANG-CHOW-WAN. A territory on the southern coast of China, north of the island of Hainan, leased to France in April, 1898, for 99 years. In November, 1899, two islands commanding the entrance to the bay were ceded to France. The total area is about 270 square miles. The population in 1906 was 176,310. The port is free. The foreign commerce amounts to about \$2,500,000 annually. In 1900 the territory was placed under the Governor-General of French Indo-China.

KWANG-HSU. Emperor of China, died on Nov. 14, 1908. He was born on Aug. 2, 1872, the son of Prince Chun (the seventh son of the Emperor Tao-kuang, and a brother of the Emperor Hsien-feng), and was named, at his birth, Tsai-t'ien. The Emperor of China at this time was T'ung-chi, the son of Tze-Hai, but upon his

death, in 1875, Tze-Hsi, who was an aunt of Tsai-tien, caused him to be placed on the throne under the title of Kwang-Hsu. In this *coup d'état* Tsai-an was believed to have had the co-operation of Li Hung Chang. In 1888 Kwang-Hsu was forced to marry a niece of Tze-Hsi, a union which still further strengthened the position of his masterful aunt, and lessened his own independence. It came about, therefore, that even after he reached his regal majority, at the age of 18 years, many of the most important functions of his supposed absolutism were withheld from him by Tze-Hsi. The complete subjection of Kwang-Hsu came in 1898, when (on Sept. 20) Tsai-tien, caused him to be placed on the throne propaganda, under the encouragement of the Emperor, caused his palace to be occupied by royal troops, who thereafter kept him isolated and virtually a prisoner. Incidentally six of his advisers, known to be in favor of the reform programme, were apprehended, and promptly executed. From this time Kwang-Hsu had little, if any, active part in the actual government of his country. Consult the biographical sketch in the *London Times* of Nov. 16, 1908. (See CHINA and Tze-Hsi.)

KWANTUNG. A Japanese leasehold in southern Manchuria, originally leased on March 27, 1898, by China to Russia for a period of 25 years, and transferred by Russia to Japan on Dec. 22, 1905. Area, 1221 square miles; population (1907), 405,685. Port Arthur and Dairen (Dalny) are situated at the southern end of the peninsula. The former had 5882 Japanese inhabitants in 1908; the latter, 18,967. Since the Japanese occupation there have been started several new industries, notably salt works, a cement factory, gas and electrical works, horse-breeding, etc. The port of Antung was opened in March, 1907, with Tatungkow as a subsidiary port. In July, 1907, an office of the Chinese Maritime Customs was opened at Dairen, which thus ceased to be a free port. For the imports and exports of Antung and Dairen see under CHINA, *Commerce*. Between Dairen and New York there is a regular steamship service. The budget of Kwantung for 1908-9 balanced at 4,653,802 yen (1 yen=49.8 cents). The Japanese Governor-General in 1908 was Viscount Oshima. The Governor-General of Kwantung also protects and controls the Japanese railways in Southern Manchuria, commands the troops, and has a general direction of political affairs.

LABOR. AMERICAN FEDERATION OF. The events of greatest importance in connection with the American Federation of Labor during 1908 were the controversies over the right to boycott and the limitation of the power of the courts in the issue of injunctions, and the political activity undertaken to enforce the Federation's demands. The decision of the United States Supreme Court in the case of *Loewe vs. Lawlor* (See *BOYCOTT*), declaring the boycott illegal, was the signal for a demand that the Sherman Anti-Trust Law should be so amended as not to imperil the existence and activities of trade unions. At the same time intense feeling was being aroused in the Federation over the alleged abuse of the restrictive power of the courts. Believing that determined and impressive action was necessary, a conference of delegates from the 116 national and international unions affiliated with the Federation was called to meet in Washington March 18. Delegates from the Farmers American Society of Equity were also seated.

This conference issued a "Protest to Congress" and an "Address to Organized Labor and Farmers of the Country." The "Protest" recounted the recent unfavorable actions of the courts in declaring the Federal Employers' Liability Law void (see *EMPLOYERS' LIABILITY*), and the Erdman Act unconstitutional in part (see *TRADE UNIONS*), in outlawing the peaceful boycott, and in restricting the use of speech and press through the injunction (q. v.). It called upon Congress to remedy all of these injustices by new laws. The "Address to Workers" called upon workingmen to stand together, and to oppose labor's enemies and support its friends; it declared that industrial rights and personal liberties had been taken away and that "the most grave and most momentous crisis ever faced by the wage-workers of our country is upon us."

With reference to the boycott, the "Protest" declared that the Sherman Anti-Trust Law was never intended to apply to labor organizations, that it applied to combinations of dollars and not of men. It therefore demanded that the law be so amended as to exempt "organizations not for profit and without capital stock and the members of such organizations or associations," and also so as to prohibit the application of that law "to any arrangements, agreements or combinations among persons engaged in agriculture or horticulture, made with a view of enhancing the price of their own agricultural or horticultural products." This demand was of course denounced by a considerable portion of the press as an appeal for special and class legislation. It was pointed out on the other hand that, in view of the language of the court in both the hatters' boycott and the Buck's injunction cases, there was at stake the life not only of trade unions, but also of many organizations, such as consumers' leagues and civic federations, striving for social uplift. The "Address of Workers" called upon labor and the friends of labor to hold mass meetings in protest, and to oppose politically those unfriendly to the true interests of working people. See *INJUNCTIONS*.

Bills embodying the demands of the "Protest Conference" were at once introduced into Congress. Moreover, the "Address to Organized Labor" led to scores of mass meetings throughout the country, from which petitions were sent to Congressmen and Senators. The result was a large number of nominal anti-injunction bills and bills exempting trade unions from the Anti-Trust Law. The Federation lobby canvassed the Congressmen and reported that 250 had signified their willingness to vote for the Federation's bills. However, the bill to amend the Sherman Act was not reported out of the House Judiciary Committee, and the dominant sentiment in both House and Senate appeared against taking action on the anti-injunction measure. The Federation blamed its old opponents, Speaker Cannon and Congressman Littlefield, largely for the inaction. The latter headed the sub-committee having charge of the injunction bills. Mr. Gompers appeared before the House Judiciary Committee on April 4 in behalf of the bill to amend the Sherman Act. He claimed that there was a clear understanding, at the time this act was passed, that labor unions would not be included in its provisions, and cited numerous judicial decisions upholding the right of laborers to combine to further their interests by peaceful means.

The effort to secure immediate action from Congress having failed, the executive committee of the Federation at once made plans for political action. They presented their demands to the National Conventions of the Republican and Democratic parties. The latter's platform incorporated unequivocal statements on all the Federation's principal demands, and the Federation officials immediately entered the political arena in behalf of the Democratic Presidential candidate. Under the slogan "reward labor's friends and rebuke its enemies," President Gompers urged upon members of the Federation and friends to discriminate carefully between candidates for legislative and judicial offices high and low. He set forth the futility of efforts to secure political favors so long as union men vote on the basis of party allegiance, instead of independently in labor's interest. He had published in the *May American Federationist* a complete list of Congressmen, with the vote for each in 1904 and 1906, showing how the change of a few votes would in many cases have changed the result. The espousal of the Democratic cause by the Federation leaders called forth a severe arraignment from President Roosevelt. Efforts were made by Republican politicians to cause disaffection among the officers of the national and international unions of the Federation by the assertion that Mr. Gompers was claiming power to deliver the labor vote. President Gompers denied repeatedly that he was attempting to interfere with the free exercise of voting privileges. There was some dissent, however, the most conspicuous case of disaffection being that of Daniel J. Keefe, sixth vice-president of the Federation. He was nominated by President Roosevelt on Dec. 1 for appointment as Commissioner-General of Immigration. Meanwhile he had been censured by the convention of the Federation for rejecting a policy adopted by the executive committee of which he was a member. While the results of these political efforts could not be distinguished in the final vote, they gave to union labor the most solid political front it has yet attained in the United States. Political agitation was also largely responsible for a further affiliation between the Federation and organized farmers. In October a tacit agreement was entered into between the Federation officials and the Farmers' National Union to assist each other politically.

At the annual convention of the Federation at Denver in November, Samuel Gompers was again elected president. His political policy was unanimously approved, even the Socialist delegates voting to ratify it. The convention made it clear by express resolution that it favors the policy of giving political support to those who in Congress and State legislatures act favorably to the interests of the industrial population. The convention declared in favor of independence in politics, stating that "the American labor movement is not partisan to a political party; it is partisan to a principle, the principle of equal rights and human freedom." Resolutions were adopted favoring an extension of the civil service; requesting an educational test for immigrants; instructing the executive committee to devise plans for organizing agricultural laborers; favoring equal woman suffrage; urging women to organize and promising support to unions of women workers; favoring

free text-books; declaring for a more extensive use of union labels; endorsing the Massachusetts system of savings-bank insurance and old-age annuities; opposing the principle of compulsory arbitration, but favoring a greater use of voluntary arbitration; demanding that municipal, State and national governments provide work for the unemployed by public construction and improvements; and providing for a committee of fifteen to investigate industrial education at home and abroad. These resolutions contain, in large part, the platform of organized labor in the United States.

LABOR LEGISLATION. A very noteworthy movement in labor legislation is that represented by the International Association for Labor Legislation, which held its 5th annual meeting at Lucerne, Switzerland, Sept. 28-30, 1908. Here were brought together representatives from practically all Western nations. This Association seeks to overcome the impediment to advanced labor legislation that arises from international competition. If one nation increases its protection of women and child laborers, or elevates the conditions of labor in the direction of greater health and safety, it thereby increases the cost of production within its borders and betters the opportunities of its competitors. The International Association pursues the policy of securing agreements among competing nations to enact and enforce certain uniform regulations. To accomplish this purpose, the Association seeks to acquire a most intimate knowledge of labor conditions in various countries, to arouse public sentiment, and to secure the enactment of a minimum standard. Through its efforts at least fourteen States of Europe have signed a convention absolutely to prohibit night work by women; and fully one-half of the States interested in the match industry have agreed to prohibit the use of yellow phosphorus in their manufacture. The 1908 meeting of the Association considered the subjects of white lead and other industrial poisons, the employment of children, home work, and insurance of workmen.

In the United States the American Association for Labor Legislation, organized in 1906, has not achieved any notable results. The competition between States in this country is an impediment to advanced labor legislation comparable to that of competition between European countries. During 1908 vigorous efforts were made to organize branches in the leading industrial States, and thus secure an organization for common action. For legislation of the year see **CHILD LABOR, TRADE UNIONS, EMPLOYERS' LIABILITY, and INDUSTRIAL ARBITRATION AND CONCILIATION.**

LABUAN. An island off the northwest coast of Borneo, attached since Nov., 1906, to the Straits Settlements (q. v.). Area, 30¼ square miles; population (1905), 9000. Victoria, the capital, has 1500 inhabitants. Rice and sago are exported, as well as coal, of which about 50,000 tons are raised annually. The imports and exports in 1907 were valued at 1,223,031 and 1,254,542 dollars (about 50 cents each) respectively. The revenue and expenditure in the same year were 104,660 and 96,835 dollars. The Resident in 1908 was M. S. H. McArthur.

LACROSSE. Greater enthusiasm and interest is accorded lacrosse in Canada than in the

United States, although the game in the latter country is steadily increasing in favor. In the contest for the championship of the National Lacrosse Union of Canada, seven teams were entered and there was a close struggle for the highest honors, which were finally won by the Tecumseh team. The Shamrocks of Montreal, who won the championship in 1907, made a very poor showing. The strongest team in the United States was that of the Crescent Athletic Club, which defeated the Toronto A. A. A., the Brantford Club, Ontario, and Montreal A. A. A. The championship of the Inter-Collegiate Lacrosse League, Northern Division, was won by Harvard with three victories and no defeats. Cornell, which won the championship in 1907, finished second with two games won and one lost. The Southern Division championship was again won by Johns Hopkins, which won all three games played.

LADRONE ISLANDS, or **MARIANNE ISLANDS**. A group of islands in the Pacific, north of the Caroline Islands and east of the Philippine Islands. Excepting Guam (q. v.), they belong to Germany. The German islands have an area of 250 square miles and 2646 inhabitants (1904). In 1907 there were 31 whites (26 German). In 1906 the imports and exports amounted to 238,000 and 56,000 marks respectively. The seat of government is on the island of Sarpan. The islands are attached to German New Guinea (q. v.).

LAFAYETTE COLLEGE. An institution of higher learning founded in 1832 at Easton, Pa. The college maintains seven courses of study leading to degrees in arts, science and philosophy, and civil, mining, and electrical engineering, and chemistry. For the year 1908-9 the enrollment was 440 undergraduate and 12 graduate students, with a faculty of 39. There are 40 buildings including the homes of the professors. The property is valued at \$1,525,651.48, of which \$731,259.23 is income bearing. The library contains 35,000 volumes. The President is Ethelbert Warfield, D.D., LL.D.

LA FOLLETTE, ROBERT MARION. United States Senator (Republican) from Wisconsin. He was born at Primrose, Wis., on June 14, 1855, graduated at the University of Wisconsin in 1879, and in the following year was admitted to the bar. He was district attorney of Dane county from 1880 to 1884, when he was elected representative to Congress where he served until 1891. In Congress he served on the Ways and Means Committee and assisted in the framing of the McKinley Tariff Bill. He was elected Governor of Wisconsin in 1900 and was reelected in 1902 and 1904. In January, 1905, he resigned the governorship to become United States Senator. As Governor he successfully advocated direct primaries, the taxing of railway property in the same manner as other property, and the Constitutional control of railway rates within the State. As a Senator he has alienated himself from many of the conservative Republican leaders because of his so-called radicalism. During the first session of the Sixtieth Congress, he bitterly attacked the Aldrich Currency Bill and its successor in compromise form, the Aldrich-Vreeland Bill, and joined with the Democrats in the filibuster conducted against that measure in May, 1908. In the campaign for the Republican presidential nomination in 1908, Senator

La Follette was put forward as the candidate of Wisconsin and received the votes of 25 delegates in the National Convention. After the November election, it was announced that Senator La Follette was to establish a weekly political paper along the lines laid down by Mr. Bryan's *Commoner*. Senator La Follette received the degree of LL.D. from the University of Wisconsin in 1907.

LAHM, FRANK P. See **AERONAUTICS**.

LAMBETH CONFERENCE. See **ENGLAND, CHURCH OF**.

LANDELLE, CHARLES. A French painter, died on Oct. 18, 1908. He was born in Laval, France, in 1821, and studied under Ary Scheffer and Delaroche. His first picture, a "Portrait of the Artist," was exhibited at the Salon of 1841. His paintings, during the next twenty years, were mainly religious in character. The most notable of this period are "Fra Angelico of Fiesole" (1842); "Charity" (1845); "The Jew of Tangiers" (1857); and the "Presentation of the Virgin" (1859; now in the Luxembourg). During the sixties he made an extensive tour of the Orient, and his later pictures are largely depictive of Oriental scenes and life. He painted portraits of several distinguished people, among them Alfred de Musset, Admiral Baudin, and the Princess de Broglie. Many of his best pictures are in the United States.

LANDS, ARID. See **DRAINAGE; IRRIGATION**.

LANDS, PUBLIC. The total area of unappropriated and unreserved public lands June 30, 1908, was 754,895,000 acres, of which 528,204,000 acres had not been surveyed. Almost three-fourths of the unsurveyed area is in Alaska, while most of the remainder is in the States or Territories of Arizona, Montana, Nevada, New Mexico, Utah and Wyoming. The total area of land originally entered during the fiscal year 1908 was 19,090,365 acres, and the area upon which final proof was made was 8,068,044 acres. The notable events of the year were the prosecution of the land-fraud cases and the opening of a portion of the Rosebud Indian Reservation.

LAND-FRAUD CASES. In January, Judge Robert E. Lewis, of the United States District Court at Denver, quashed the indictments of a number of more or less prominent citizens of Colorado in cases arising under the Timber and Stone Act of 1878. The defendants were for the most part members of corporations that had acquired large tracts of timber land. The charge was that they had hired persons to make entries for quarter-sections of timber land, such persons to pay the government price for land thus entered, using therefor money to be supplied by the corporation, and thereafter to transfer title to the corporation. Judge Lewis held that the transfer of title to the corporation after the fulfilling of legal requirements was not proof that the preliminary application was not made in good faith. He also held that the conspiracy alleged to have been involved in the transactions ceased when the entryman turned the title over to the agent of the corporation, and that the subsequent transfer from the agent to his corporation was a mere detail. The practical effect of this last opinion of the Court was to prevent criminal prosecutions owing to the operation of the statute of limitations. The government appealed to the Su-

preme Court, which reversed the decision. See COLORADO.

The case against Frederick A. Hyde, John A. Benson, Joost H. Schneider, and Henry P. Dimond in the Supreme Court of the District of Columbia was terminated on June 23. These men were accused of conspiracy to obtain public lands by fraudulent entry. The laws admitting California and Oregon to the Union set aside certain sections for public school purposes. The States provided for the sale of these lands only on the purchaser's oath that the land was taken for his exclusive use and benefit. Then in 1897 Congress provided for the exchange of lands privately owned, but situated within national forest reserves, for public lands outside reserves, acre for acre. It thus became possible to make a profit by securing title to school lands within reserves and exchanging them for better land outside. Messrs. Hyde and Benson were convicted of hiring persons to make application, and to secure title with money furnished by them, such titles to be later transferred to them. They even went so far as to pay small sums for the use of names in making application; indeed, they even used fictitious names. Having found this system workable, Hyde and Benson, according to the evidence, bribed land-office employees both to enable them to dictate where new forest reserves should be located, and to expedite their business with the land office. Four employees were dismissed from that office for being in the pay of the conspirators. The operations of these plunderers extended to twenty States, about 250,000 acres of land being involved. The evidence showed that Hyde and his employee, Schneider, were the chief agents of the whole plot; hence, Benson and Dimond were acquitted. On Dec. 8, Hyde was sentenced to pay a fine of \$10,000 and to serve two years in the penitentiary at Moundsville, W. Va. This penalty was the severest possible. Schneider was sentenced to pay a fine of \$1000, and to serve fourteen months in prison. Both men appealed. The successful prosecution of this noted case saved millions to the United States, checked other plans for plundering the public domain, and strengthened the prosecuting power of the government.

ROSEBUD OPENING. A portion of the Rosebud Reservation was opened in October. An innovation in the method was the designation of four different places in Nebraska and South Dakota where affidavits of registration could be made out and mailed to Dallas, South Dakota, where the drawing was done. There were in all 114,769 registrations for the 4000 farms of 160 acres each comprised in the tract. The land was disposed of at \$6 per acre, on easy payments, though some of the best quarters were estimated by land agents to be worth from \$5000 to \$10,000. Registration continued from October 5 to 17, drawings being made October 19. There were large crowds at all registration points. The total expense of those who registered was estimated at much more than the value of the entire tract opened.

LANGUAGE. INTERNATIONAL. See INTERNATIONAL LANGUAGE.

LAOS. A French protectorate in Indo-China, embracing the states of Luang Parabang, Bassac, and Muong Sing. Area, about 98,400 square miles; population, estimated in 1906 at 346,487. Gold, tin, lead, and precious

stones are found, and concessions have been granted to several French mining companies. Teak logs from the forests are floated down the Mekong to Saigon. Rubber is obtained from wild creepers, principally met with in the forests of Upper Laos. The natives cultivate rice, cotton, indigo, tobacco, and fruits. The country has not yet been opened up for commercial and industrial purposes. The Mekong is the main artery of traffic. The imports and exports are included in those of French Indo-China (q. v.). The king is assisted by the French Superior Resident at Vientiane. The local budget for 1908 balanced at 1,018,000 francs.

LAPPARENT, ALBERT AUGUSTE COCHON DE. A French geologist, died on May 10, 1908. He was born in Bourges, on December 30, 1839, was educated at the Polytechnique (1858-60), and at the École des Mines. In 1875 he became professor of geology and mineralogy at the Catholic Institute of Paris. He was also appointed to a chair of mineralogy, geology and physical geography in the École Libre des Hautes Études. In 1874, as secretary of the Channel Submarine Tunnel Committee, he made soundings and studies of the sea bottom of the English Channel, which have been much used in all subsequent channel tunnel projects. To geology his greatest contribution was his *Traité de géologie*, first published in 1881 in a single volume, but thereafter improved and enlarged until, in 1906, the fifth edition comprised three volumes, and including a series of maps illustrating tentatively the geographical features of various regions in successive geological ages. Lapparent was elected perpetual secretary of the Academy of Sciences, in 1907, as the successor of Pierre Eugène Marcellin Berthelot, the chemist. In addition to the *Traité de géologie*, he published: *Cours de minéralogie* (1884 and afterwards); *Les tremblements de terre* (1887); *La géologie en chemin de fer* (1888), and *Le siècle du fer* (1890).

L'ARRONGE, ADOLF. A German dramatist and theatrical manager, died on May 25, 1908. He was born at Hamburg, in 1838, studied music at the Leipzig Conservatory, and became conductor of an orchestra in Cologne, in 1860. From 1866 to 1869 he was a bandmaster at Berlin. He managed a theatre in Breslau from 1874 to 1878. About this time he began writing comedies, illustrative of life in the lower middle classes, which were immensely successful. The best of these are *My Leopold*, *Dr. Klaus*, *Hasemann's Daughters*, and *Charitable Women*. He was one of the founders of the Deutsches Theatre in Berlin, in 1883, and managed it until 1891, producing several of his own plays. He wrote *A History of the German Theatre and German Acting* (1896).

LATIMER, ASBURY CHURCHWELL. United States senator from South Carolina, died on February 20, 1908. He was born near Lowndesville, Abbeville County, S. C., on July 31, 1851, and was brought up on his father's farm and had a public school education. He took an active part in the campaigns of 1890 and 1892, in which year he was elected to Congress, where he served until 1903, when he took his seat in the Senate, as the successor of John L. McLaurin. As a member of the Manufactures Committee he had an important part in drafting the Pure Food Law; and he

also had to do with the framing of the pending copyright bill. As a member of the Immigration Committee he visited Europe in 1907, and had in the course of preparation an elaborate report dealing with immigration in the countries he visited. He served efficiently at different times on the committees on Agriculture, Immigration, Manufactures, Public Buildings and Grounds, and Census.

LAWN TENNIS. The season of 1908 again emphasized the fact that there are but few really first-class lawn tennis players in the United States. The best showing in the tournaments of 1908 was made by W. A. Larned of Summit, N. J., and B. C. Wright of Boston in the singles and by H. H. Hackett and F. B. Alexander and W. A. Larned and W. J. Clothier in the doubles. At the all-comers national championships tournament, held at Newport, August 18-28, there were 145 entries. In the singles finals B. C. Wright defeated F. B. Alexander 6-3, 6-3, 6-3, but in the challenge round W. A. Larned defeated Wright 6-1, 6-2, 8-6. The doubles were won by H. H. Hackett and F. B. Alexander, who defeated B. C. Wright and R. D. Little 6-1, 7-5, 6-0. In the women's national championship tournament at Philadelphia, June 23-27, Mrs. Barger-Wallach, New York, defeated Miss Evelyn Sears, Boston, in the challenge round 6-2, 1-6, 6-3. Miss M. Curtis and Miss Evelyn Sears, Boston, won the championship in doubles, defeating Miss C. Neeley and Miss M. Stover, Chicago, 6-3, 5-7, 9-7. The international tournament at Boston, September 17-19, was to decide as to whether an American or an English team was to contend with the Australian team in the Davis international challenge cup tournament, to be held at Melbourne, Australia. The results of the trials at Boston were: J. G. Ritchie, London, the winner of the gold medal at the Olympic games, defeated B. C. Wright, Boston, 6-1, 6-3, 6-2; W. A. Larned, Summit, N. J., defeated J. G. Parke, Dublin, 6-3, 6-3, 7-5; Wright defeated Parke, 8-10, 3-6, 6-4, 7-5, 6-2; Larned defeated Ritchie 4-6, 6-3, 6-2, 6-3. In the doubles, H. H. Hackett and F. B. Alexander, N. Y., defeated Parke and Ritchie, 6-3, 2-6, 7-5, 6-1. B. C. Wright and F. B. Alexander, of the winning team, were selected to represent the United States in the Melbourne tournament. The results of this tournament, which was held on November 27, 28 and 30, were: B. C. Wright (U. S.) defeated A. F. Wilding (Australia) 3-6, 7-5, 6-3, 6-1; N. E. Brookes (Australia) defeated F. B. Alexander (U. S.) 5-7, 9-7, 6-2, 4-6, 6-3; A. F. Wilding (Australia) defeated F. B. Alexander (U. S.) 6-3, 6-4, 6-1; B. C. Wright (U. S.) defeated N. E. Brookes (Australia) 0-6, 3-6, 7-5, 6-2, 12-10; (doubles) Brookes and Wilding (Australia) defeated Alexander and Wright (U. S.) 6-4, 6-2, 5-7, 1-6, 6-4. Australia won the tournament with two victories in the singles and one in the doubles, as against the United States' score of two victories in the singles. The national indoor championship tournament was held at New York, February 23-29, the championship in men's singles being won by W. C. Grant of the New York Tennis Club, who defeated G. F. Touchard in the finals, 6-2, 6-8, 6-3, 6-4. F. B. Alexander and H. H. Hackett won the championship in men's doubles, defeating W. B. Leragin, Jr., and M. S. Char-

lock, 6-3, 6-1, 6-4. In the women's singles Miss Marie Wagner, New York, defeated Mrs. F. Schmitz, London, 6-3, 6-2. The women's doubles were won by Mrs. W. H. Pouch and Miss E. H. Moore. The intercollegiate championship in singles was won by N. W. Miles, Harvard, who defeated A. S. Dabney, also of Harvard, in the finals, 7-5, 6-1, 3-6, 6-2. Tilden and Thayer of the University of Pennsylvania won the championship in doubles, defeating Holden and Bundy of Yale, 6-2, 5-7, 8-6, 5-7, 6-6, 6-4, 11-9, 6-4. In dual college tournaments Princeton defeated Columbia, 5 matches to 4; Yale defeated Princeton, 8 to 1; Harvard defeated Yale, 5 to 4. Other tournaments of the year and their winners were: All-England, men's singles, A. W. Gore; women's singles, Mrs. Sterry; Olympic, men's singles, J. G. Ritchie; women's singles, Mrs. Lambert Chambers; Middle States, men's singles, E. P. Larned (by default); men's doubles, W. A. Larned and G. L. Wrenn; women's singles, Miss C. B. Neeley (by forfeit); women's doubles, Mrs. A. H. McCarthy and Miss Johnson; Pacific Coast, men's singles, M. Long; men's doubles, M. McLoughlin and G. Janes; women's singles, Miss Mary Sutton; international (Niagara, Ont.), men's singles, N. W. Niles; women's singles, Miss Marie Wagner.

LEAD. The production of primary refined lead, desilverized and soft, from domestic and foreign ores in the United States during 1908, according to estimates of the United States Geological Survey, was approximately 391,000 short tons, worth at the average price \$32,844,000 as compared to a production of 418,189 tons in 1907 and 404,746 tons in 1906. These figures were exclusive of an estimated output of 12,000 tons of antimonial lead, as against 9,910 tons in 1907. Of the total production, desilverized lead comprised 287,500 tons, as against 314,241 tons in 1907. The soft-lead production increased to 103,500 tons, compared to 99,948 tons in 1907. The increased output of soft lead accompanying a decrease in desilverized lead indicated that Missouri retained the first place among lead-producing States, as its southeastern and Joplin districts are the largest sources of production, though the Cœur d'Alene district of Idaho, and Leadville, Col., where the lead is produced by treatment of argentiferous ores, join with it to make up nearly 80 per cent. of the United States production.

There was 50 per cent. increase in the imports of lead in ore and base bullion, which amounted to 105,000 tons, valued at \$4,180,000, as compared to 70,538 tons in 1907. From this it was inferred that the production of desilverized lead of foreign origin increased considerably over that of 1907, which was 67,423 tons. The imports of refined lead fell off considerably, being 3,000 tons, with a value of \$200,000, against 9,277 tons in 1907. The exports of foreign lead (lead of foreign origin smelted or refined in the United States) show an increase of nearly 50 per cent., being 75,000 tons, valued at \$3,024,000, compared to 61,424 tons in 1907. The exports of lead manufacturers remained practically stationary, with a value of about \$600,000.

The price of lead started in January with a minimum of 3.625 cents per pound, rising to the maximum figure of 4.60 cents per pound

in August, then declining slowly to the close of the year. The average New York price for the year was 4.2 cents per pound.

The statistics of production as given by the *Mineral Industry* and the *Engineering and Mining Journal* are presented in Table I.

TABLE I.—PRODUCTION OF LEAD IN THE UNITED STATES, 1904-1908

	1904	1905	1906	1907	1908
	short tons	short tons	short tons	short tons	short tons
Domestic	200,858	205,665	220,095	213,383	182,401
Desilverized		81,299	100,492	108,518	110,059

Total	951,710	962,144	967,972	968,174	964,910

a Included with Austria.

LEATHER. This industry in 1908 was marked by an attempt at recovery from the panic conditions and prices of 1907 and naturally the year was one of more or less depression. Hides were at their lowest value in January and at their highest in December, so that the gradual recovery indicated wholesome progress. The average for Chicago packer hides for 1908 was \$11.583, with the highest price in December, \$13.797, and the lowest, \$9.417, in January. The average price in 1907 was \$12.744, and in 1906, \$13.964. For Chicago country hides the average for 1908 was \$9.63, with the high point \$12.45 in December and the low, \$7.801 in January. The average price in 1907 was \$11.135, and in 1906, \$13.352. During the year there was the greatest interest in the proposed revision of the tariff, but no substantial unanimity of opinion on the part of the various interests concerned. There was, however, more of a demand for free hides than at any previous time, and it seemed that manufacturers were in favor of a reduction or removal of the duty.

LECIBRIN. A preparation of lecithin from the brain of animals, combined with nucleoproteins, containing 33 1-3 per cent. by weight of lecithin, upon which preparation it is designed as an improvement. It is indicated in functional nervous troubles arising from defective elimination, and its good effects are probably due to the phosphorus contained in it.

LECOT, VICTOR LUCIEN SULPICE. CARDINAL. A Roman Catholic cleric, died on December 20, 1908. He was born at Montescourt, on January 8, 1831, was appointed bishop of Dijon in 1886, archbishop of Bordeaux in 1890, and was created a cardinal on January 16, 1893. Although Cardinal Lecot unsparingly condemned the church separation law, he advocated a conciliatory policy, and led the faction which attempted to make that attitude the formal one of the church toward the State. He urged the Pope to sanction the organization of religious associations, and formed in his own diocese an association, under the terms of the new law, the scheme of which would have enabled the church

to meet the situation creating canonical privileges. He was generally in sympathy with M. Briand's endeavors to establish a *modus vivendi* which could be accepted by the church. By his death the number of French cardinals was reduced to three—Mgrs. Coullié Archbishop of Lyons; Lucon, Archbishop of Reims, and Andrien, Bishop of Marseilles.

LEE, LESLIE ALEXANDER. An American biologist, died on May 20, 1908. He was born in Woodstock, Vt., on September 24, 1852, graduated at St. Lawrence University in 1872, did graduate work at Harvard in 1874, and took his Ph. D. in 1885. In 1876 he became professor of biology and geology at Bowdoin, and he held his chair during the remainder of his life. In 1887 he was chief of the scientific staff of the United States Fish Commission on the expedition in the steamer *Alabama* through the Straits of Magellan, during which much biological, geological, and ethnological matter was collected for the Smithsonian Institution. Many reports of this expedition were published by the United States National Museum. He was also director in 1891 of the Bowdoin College expedition to Labrador which made valuable collections in that region, and rediscovered Grand Falls, in the Grand (or Hamilton) River, about 250 miles west by south of Hamilton Inlet.

LEE, STEPHEN DILL. An American Confederate soldier, died at Vicksburg, Miss., on May 28, 1908. He was born at Charleston, S. C., on September 22, 1833, graduated at the United States Military Academy at West Point in 1854, and served in the Fourth Artillery until his resignation in 1861. He saw service against the Seminoles in 1856-7 and in the troubles in Kansas. Entering the Confederate Army as a captain he served in the Army of Northern Virginia until after Antietam when he was transferred to the West with the rank of brigadier-general. He distinguished himself during the siege of Vicksburg, became a prisoner on its surrender, and when exchanged became a major-general. At the close of the war he commanded a corps of the Army of Tennessee with the rank of lieutenant general. He became a planter in Mississippi after the war, served in the State Legislature, was president of the Mississippi Agricultural and Mechanical College from 1880 to 1889, and in 1890 was a member of the State Constitutional Convention. He had been president of the United Confederate Veteran Association since 1904, and Superintendent of the Vicksburg National Military Park from 1899.

LEEWARD ISLANDS. A British colony in the West Indies, comprising the Presidencies of Antigua (q. v.), St. Kitts (q. v.), Dominica (q. v.), Montserrat (q. v.), and Virgin Islands (q. v.). Total area, 702 square miles; population, 134,000. For the products, commerce, etc., of the various subdivisions, see under the respective titles. The total imports and exports in 1907-8 were valued at £517,424 and £521,509, respectively. The trade is chiefly with Great Britain, the United States, and Canada. The export of sugar in 1907 was 28,419 tons, of which 13,972 came from Antigua and 14,132 from St. Kitts. The cotton export in the year ending March 31, 1908, was 934,266 pounds. The revenue in 1907-8 was £151,520;

the expenditure, £134,273; and the public debt, £273,850. The Governor in 1908 was Sir B. S. Escott. His seat is on Antigua.

LEHIGH UNIVERSITY. An institution of higher learning at South Bethlehem, Pa., founded in 1866. In 1908 there were 681 students in the university, divided as follows: Arts and sciences, 35; civil engineering, 199; mechanical engineering, 139; mining engineering, 106; electrical engineering, 142; metallurgical electrical engineering, 142; metallurgical engineering, 9; electro metallurgy, 14; chemistry, 16; chemical engineering, 21. Its students represent 26 States and 10 foreign countries. The university has a teaching force of 64. In September, 1908, the Conference Department, composed of certain professors and instructors of the departments of Mathematics, Physics, Chemistry, and Modern Languages, was established to aid students who find any difficulty with their current work. This is an innovation in college policy and since its establishment the department has been greatly beneficial to students who find any difficulty with their work. The funded endowment of the university is \$1,178,000, yielding an annual income of \$55,530. The total income of the university from all sources is about \$180,000.

LELAND STANFORD, JR., UNIVERSITY. An institution of higher learning at Palo Alto, California, founded in 1887. The registration of students on October 1, 1908, was 1518. The total attendance for 1907-8 was 1751. The university has completed restoration of all its working buildings injured in the earthquake of April, 1906. It has begun also the restoration of the Memorial Church, which was badly wrecked at that time. During 1907-8 the attention of the faculty has been directed toward the question of entrance requirements. President Jordan has advocated the division into university and junior college work, the freshman and sophomore years being cut off. In 1908 the university acquired the building and property of the Cooper Medical College of San Francisco, which forms the nucleus of a medical department, instruction to begin in 1909. The absence of the new gymnasium has necessitated the development of outdoor athletics. The library contains 97,775 volumes. The faculty numbers 138; the productive fund is \$24,525,922; and the income is \$854,812. David Starr Jordan is president.

LEMOINE'S DIAMOND PROCESS. See ARTIFICIAL GEMS.

LE PLONGEON, AUGUSTUS. A well known archaeologist, died on December 13, 1908. He was born on the Isle of Jersey, in 1826, the son of a commodore in the French Navy, who was a descendant of De Toqueville. He was educated in France, studied medicine, and for several years practised in South America. His interest in the early history of that continent induced him to make a careful study of the Peruvian people, and his books, *Queen Nino and the Egyptian Sphynx* and *Sacred Mysteries among the Mayas and the Quiches*, are considered standard works on the Peruvians.

LEPROSY. The search for a specific treatment of this disease continued in 1908. Deyeke isolated a characteristic organism which he termed *Straptothrix leproides*. From this organism he extracted with ether a genuine neu-

tral fat which he called "nastin." The injection of this substance into lepers gave rise to a reaction resembling that of tuberculosis patients to tuberculin (q. v.). By combining nastin with benzoyl chlorid its activity was remarkably increased. The resulting solution appeared to act on the lepra bacilli, nastin enabling the benzoyl to deprive the bacilli of their fat and thus destroy them. A trial of the nastin treatment was made on a leper at the Kalihi Receiving Station, Hawaii. All clinical symptoms disappeared, and the bacilli were still present were gathered in bunches instead of being widely distributed. The conclusion must be that while the remedy has a distinct effect, no positive cure can as yet be shown. The X-rays and high-frequency currents were used to some extent upon the superficial lesions of leprosy with, according to Matthews of Calcutta, decided benefit. The Louisiana Leper Home reported one leper discharged cured and five others practically well, but still under observation.

RAT LEPROSY. The campaign against rats on account of the plague (q. v.) brought to light a leprosy-like disease among these rodents, in the proportion of 1 to 614 examined. Passed Assist. Surgeon McCoy, who makes the report in the *Public Health Reports*, believed the disease even more prevalent. The skin lesions and alopecia resembled those of human leprosy very closely, and the bacilli found in the ulcers and glands were morphologically indistinguishable from the lepra bacillus of Hansen. In the opinion of Brinckerhoff the geographical distribution of the disease indicates that it is not identical with human leprosy, but it is probably related to it in some such way as bovine is to human tuberculosis (q. v.).

LEYDIG, FRANZ VON. A German zoölogist, died on May 13, 1908. He was born in Rothenburg-on-the-Tauber, on May 21, 1821, studied medicine at Marzburg and Munich, became professor at Tübingen in 1857 and at Bonn in 1875, and retired in 1895. He published several important works on comparative histology and anatomy, such as *Anatomisch-histologische Untersuchungen über Fische und Reptilien* (1853); *Der Eierstock und die Samertasche der Insekten* (1866); *Die augenähnlichen Organe der Fische*, on a supposed sixth sense in fishes; *Zelle und Cecebe* (1885); *Zur Kenntnis der Zirbal und der Parietalorgane* (1896), and *Horae Zoological Zur vaterländischen Naturkunde* (1902).

LIBERIA. A negro republic on the west coast of Africa. Area 35,000 square miles; population, about 1,500,000, about 12,000 being of American origin. Monrovia, the capital, has about 5,000 inhabitants. Only the coast strip is administered. The principal export articles are coffee, palm-oil, palm-nuts, rubber and ivory. The rubber trade is said to possess great possibilities, but hitherto the disturbed state of the interior, absence of roads, and the difficulty of obtaining labor have checked its development. In 1906 imports and exports were valued, respectively, at \$766,526 and \$777,507. During the year ending June 30, 1908, the United States imported from Liberia goods to the value of \$45,578, and exported to it \$58,432 worth. British influence is extending. In 1905 the Liberian Development Company, a British corporation, advanced £100,000 to the government for es-

tablishing a bank, constructing roads, raising a force of native constabulary under the command of a British officer, and installing telegraphic communication. Two British officials have been charged with the task of reorganizing the customs service and the general financial affairs of the country. The new bank, entitled the Government Bank of Liberia, has already been established under the management of the company officials; it is entrusted with the function of receiving all customs duties on behalf of the government. The executive power is vested in a president, elected for four years, in accordance with a recent amendment to the Constitution. In 1908 the president was Arthur Barclay, reelected in 1907. The legislative power is vested in a Senate, the members of which are elected for six years, and a House of Representatives, the members of which are elected for two years. The revenue and expenditure in 1906 amounted to \$357,433 and \$340,036, respectively. The foreign debt in 1907 stood at about \$170,000; the internal debt, at \$300,000. Military service is obligatory on every able-bodied citizen between the ages of 16 and 50 years. The number of organized militia volunteers and police was about 700 in 1908.

HISTORY. In 1907 a treaty was concluded between France and Liberia and under its terms a boundary commission was sent out by France, which reached Fassariguni on November 15. It reported that it was making its way with difficulty on account of the density of the jungle and the hostility of the natives, and that in an encounter with the latter it had lost the physician to the expedition. Envoys were sent from Liberia to Europe and the United States in 1908 to solicit aid and sympathy for the republic. The deputation to the United States appealed to the Secretary of State on May 26. Reference was made to the encroachment on Liberian territory by adjoining countries. The need of white assistance in the introduction of governmental reforms, especially in the finances, was urged. Investigation by the American Department of State showed that the difficulties of the Liberian government might be described as amounting to a general breakdown. As Secretary Root summed up the situation, between forty and fifty thousand civilized negroes, for the most part descendants of the original colonists from the United States, occupy a territory comprising 43,000 square miles, in which there are also over a million and a half members of uncivilized native tribes. The civilized part of the population have been to a great degree cut off from any intimate relation with the rest of the civilized world for two-thirds of a century. They began with little education, with no acquired skill in the art of government, and they have had little opportunity to improve through intercourse with other and more advanced communities. They find it especially difficult to control the native tribes, or to conduct their own government in accordance with modern requirements. The British colony of Sierra Leone to the north and the French possessions closing in their hinterland to the east are almost continuously complaining of the failure of Liberia to maintain order upon the border. "Notwithstanding the very kindly disposition on the part of Great Britain, and the similar disposition on the part of France, there is imminent danger that the re-

public, unless it receives outside assistance, will not be able to maintain itself very long," said Mr. Root.

LIBRARY ASSOCIATION, AMERICAN. A society organized to develop the public library in its bearing on American education and by coöperation to increase the efficiency of library administration, established at Philadelphia in 1876 and incorporated under the laws of Massachusetts in 1879. The 30th annual meeting was held at Lake Minnetonka, Minnesota, on June 22-29, 1908. There was an attendance of 658. Aside from the regular committee reports, the principal topics discussed were: The Librarian as a Censor; More Recent and Standard Books; Library Training, and Open Shelves and Book Losses. The official organ of the association is the *Bulletin of the American Library Association*, in which are published the proceedings of the annual meetings. The association has been instrumental in establishing library organizations in 38 States, besides many local library clubs in cities and districts. Four sections are maintained, cataloguing, library work with children, college and reference, and trustees. The association has affiliated with it the three following national organizations of kindred purpose: the National Association of State Libraries, the League of Library Commissions, and the American Association of Law Libraries. These hold separate sessions at the same time and place, with the annual meeting of the larger body, and each prepares a programme, arranged by its own officers. The most important activity of the association is the publishing board which operates under the gift of \$100,000 made in 1902 by Andrew Carnegie. The income of this fund is used in the preparation of indexes, of bibliographies, reference helps, and literature for promoting library extension and the selection of books. It published in 1902 an important bibliography of American history. In 1904 it prepared the A. L. A. Catalog, a Guide to Classification, Cataloguing and Book Selection, published by the Library of Congress and first distributed by the International Library Conference, held in connection with the Louisiana Purchase Exposition. In 1906 the Library of Congress published an extensive index to 120,000 portraits upon which the publishing board had been at work for over ten years. The officers for 1908-9 are as follows: President, C. H. Gould, McGill University; First Vice-President, N. D. C. Hodges, Cincinnati Public Library; Second Vice-President, Mrs. H. L. Elmhendorf, Buffalo Public Library; Treasurer, Purd B. Wright, St. Joseph, Mo., Public Library; Recorder, Alice B. Kroeger, Drexel Institute Library, Philadelphia. The Secretary and executive officer of the Association is J. I. Wyer, New York State Library.

LIBRARY OF CONGRESS. A public and national institution, founded at Washington, D. C., in 1800. In 1908 the library contained 1,535,008 books, 105,118 maps and charts, 483,411 volumes and pieces of music, 279,567 prints. The acquisitions of the year numbered 100,067 printed books and pamphlets. Only one collection of importance in any department of literature was acquired during the year. This was the Huitfeldt-Kaas collection of Scandinavian literature, which was the private library of Henrik Jørgen Huitfeldt-Kaas, the late State Arch-

ivist of Norway. The collection contains first editions of all the works of Ibsen, Bjørnsen and Jonas Lie, now very difficult to obtain. It also includes many valuable editions of the works of other leading masters of Denmark and Norway during the 15th century, and is rich in Scandinavian biography, genealogy, local and theatrical history. In the early laws of Norway the collection includes some works which are found in only a few libraries in Europe, and probably in no other library of the United States. Among the important acquisitions of manuscripts received by the library during the year were the papers of Harry Innes, a distinguished personage in Kentucky affairs in the early part of the 19th century. There were received also the papers of the firm of Riggs & Co., and Corcoran and Riggs, a mercantile and banking house of long standing in Washington. In the division of manuscripts, the calendar of the military papers of Washington progressed steadily and without interruption during the year. It is probable that one more year will be required for this work. The calendar of papers relating to New Mexico also progressed, and has reached the year 1791. The additions to the Journals of the Continental Congress continued without interruption on the plan originally laid down in 1903. In the fiscal year 1908, three volumes, 10, 11 and 12, covering the record for 1778, were printed. During the fiscal year 43,680 acquisitions were made in the Department of Documents, which are chiefly reports and papers relating to foreign countries. In the Department of Music, a notable gift was received in a volume containing several characteristic autograph scores of the late John Knowles Paine, containing his unfinished tone-poem, Lincoln. The number of visitors and users of the library in the fiscal year were 938,129. Appropriations made for the support of the library in 1907-8 amounted to \$670,405.08, of which there was expended \$668,588.88. The librarian is Herbert Putnam.

LIE, JONAS LAURITZ EDEMIL. A Norwegian novelist and poet, died on July 6, 1908. He was born near Drammen, Norway, on November 6, 1833. He entered the naval academy at Fredrikvoern in 1846, but being unfitted for a naval career on account of near-sightedness, was transferred to the Bergen Latin School. In 1851 he entered the University of Christiania, where Bjørnsen and Ibsen were his fellow-students. After taking his degree in law, he began to practice in Kongsvinger. In 1866 he published a collection of poems, which attracted considerable attention. An unfortunate business speculation having consumed his entire capital, he moved to Christiania, where he tried teaching journalism and literature. His efforts in the last-named vocation were crowned with success by the appearance, in 1870, of *The Visionary*, a romance, which made him famous throughout Norway. This was followed by *The Bark "Future,"* in 1873, and *The Pilot and His Wife*, in 1874. Lie was now the acknowledged head of Norwegian novelists. The government awarded him a travelling stipend, and he moved to Germany. Here he wrote, among other novels, *Rutland* (1881), and *Go Ahead* (1882). In 1882 he moved to Paris, where he wrote *A Maelstrom* (1884), *The Commodore's Daughter* (1886), *Married Life* (1887), and several other novels, besides a collection of 24 folk-tales under the

title of *Troid* (2 vols., 1891-92). In 1893 he returned to Norway, and settled near Christiansand, where he continued to live for the remainder of his life. His later important novels are *Niobe* (1893), *When the Curtain Falls* (1901), and *Ulfounger* (1904). He was passionately fond of the sea, and few writers have excelled him in describing a sailor's life and surroundings. His novels have been translated into several languages. Upon his death, the Norwegian government accorded him a state funeral.

LIEBREICH, OSKAR: A German pharmacologist, died on July 2, 1908. He was born in Königsberg, on February 14, 1839, studied chemistry under Fresenius in Wiesbaden, and in 1857 embarked on a two years' cruise to Africa and other distant countries, his intention at that time being to enter the navy. But he abandoned this idea, studied medicine in Königsberg, Tübingen and Berlin, and became assistant to Virchow in the last-mentioned university in 1867, professor of therapeutics in 1868, and director of the pharmacological institute in 1872. This position he held until 1908, when advancing arterio-sclerosis affected his brain, and he was forced to retire. In 1872 he discovered the narcotic action of chloral hydrate; this had been produced and described by Liebig in 1832, but it had remained for Liebreich to make practical use of it. Among his other important achievements were the discovery of butylchloral and ethyl chlorid, the "determination that protagon is the principal phosphorus-containing constituent of the brain (an observation which Liebreich made when a student), the introduction of hydrargyrum formamidatum, and especially that of lanolin," and his chemical studies of food-stuffs and investigation of balneotherapy. Liebreich edited the *Therapeutische Monatshefte* (1887 sqq.) and the *Encyklopädie der Therapie* (1895 sqq.), and with Langgaard prepared the widely-used *Kompendium der Arzneiverordnung* (5th ed., 1902).

LIFE INSURANCE. See **INSURANCE.**

LIGHT. See **PHYSICS.**

LIGHTHOUSES. During the year 1908 there were no lighthouses of large size or novel construction built or building in the United States. The Lighthouse Board, however, was carefully considering various types of illuminants, and it seemed that greater economy and efficiency over the oil lamps so extensively used could be effected. With a number of first order lights, as well as with smaller lights incandescent oil vapor has been used with some success. The plant at each station consists of a high-pressure air tank with reducing valve attached and gauge, an oil and air tank connecting with the lamp, tubing through which is forced oil vapor from the tank to the burner, a spirit lamp for the initial heating of the oil to the vapor point, after which it is heated by the flame of the mantle and burner. The lamp itself comprises the vaporizer, Bunsen burner and mantle. It was found in the tests made in 1907 and 1908 that the incandescent oil vapor and mantle required more constant watching than the oil lights, although there seemed to be opportunity for improvement in mechanism and use, while the increase in candle power was marked, as, for example, in the first order 5-wick fixed lamps, Block Island, Southeast, and

Shinnecock Bay, the light which formerly gave 12,188 C. P. was increased to 45,690 C. P. A fourth order 4-panel flashing light at Point Judith was increased from 6,000 C. P. to 75,048 C. P. and similar gains were obtained at other stations. The efficiency, considering the cost of oil only, is considerably in favor of the new vapor lamps, but this is offset by the cost of mantles and the alcohol to start the light. The Lighthouse Board also carried on experiments with acetylene in acetone for lighthouse illumination at a number of stations.

There were in 1908 under the control of the United States Lighthouse Establishment the following named aids to navigation:

Lighthouses and beacon lights	1,681
Light vessels in position	51
Light vessels for relief,	12
Fog signals	506
Gas-lighted buoys in position	162
Post lights, about	1,890
Day or unlighted beacons	1,063
Buoys in position, including stakes and buoys in Porto Rican, Hawaiian, and Alaskan waters	5,810

In the construction, care, and maintenance of these aids to navigation, there were employed:

Submarine signals	42
Steam tenders	44
Steam launches	3
Light keepers, about	1,631
Officers and crews of light vessels and tenders, about	1,699
Laborers in charge of post lights, about	1,514
Laborers and mechanics under lighthouse engineers, about	395

There were some 115 lights discontinued during the fiscal year 1908, mostly small inexpensive lights.

The following appropriations were made for the support of the Lighthouse Establishment for the fiscal year ending June 30, 1909:

Supplies of lighthouses	\$700,000.00
Repairs and incidental expenses of lighthouses	950,000.00
Salaries of keepers of lighthouses ..	1,160,000.00
Expenses of light vessels	925,000.00
Expenses of buoyage	900,000.00
Expenses of fog signals	250,000.00
Lighting of rivers	375,000.00
Survey of lighthouse sites	1,000.00
Oil houses for light stations	10,000.00
Maintenance of lights—on channels of Great Lakes	4,000.00
Point au Pelee light vessel, Lake Erie ..	4,000.00
New tenders and light vessels, new light stations and repairs and miscellaneous public works under the control of the Lighthouse Establishment	893,650.00
Total	\$6,172,650.00

The Lighthouse Board of the United States, which is under the jurisdiction of the Department of Commerce and Labor, on June 30, 1908 consisted of the following members as provided by law: Hon. Oscar S. Straus, Secretary of Commerce and Labor, ex-officio president; Capt. Adolph Marix, U. S. Navy, chairman; Col. Walter S. Franklin; Dr. Henry S. Pritchett; Lieut. Col. Harry F. Hodges, Corps of Engineers, U. S. Army; Capt. S. P. Comly, U. S. Navy; Capt. James M. Helm, U. S. Navy, naval secretary; Lieut. Col. Thomas L. Casey, Corps of Engineers, U. S. Army, engineer secretary. The executive members of the Board were: Capt. Adolph Marix, U. S. Navy; Capt. J. M. Helm, U. S.

Navy; Lieut. Col. Thomas L. Casey, Corps of Engineers, U. S. Army.

LILLEY, GEORGE LEAVENS. An American politician, Governor-elect of Connecticut. He was born at Oxford, Mass., on August 3, 1859, and was educated in the public schools and at the Worcester Polytechnic Institute. In 1901 he was elected to the Connecticut State Legislature, and in the following year was chosen representative-at-large to Congress, having been reelected in 1904 and 1906. During the first session of the Sixtieth Congress he made accusations of graft and corruption in connection with the letting of submarine boat contracts, and introduced a resolution calling for a committee of investigation. The committee appointed, after having held several hearings, reported that Mr. Lilley's charges were unfounded and also took occasion bitterly to arraign him for his action in the matter. In September, 1908, he was nominated for Governor by the Republican State Convention, despite the opposition of many of the party leaders, and in November was elected to that office by a plurality of 15,919. That he did not command the full support of his party is indicated by the plurality given Mr. Taft, which was nearly 45,000. In December, 1908, action was brought against Mr. Lilley for failing to observe the Corrupt Practices Act, which had been passed by the Legislature in 1904, the complaint specifying that the expenditures made in the conduct of his campaign were contrary to the law. See CONNECTICUT and UNITED STATES, Section Navy.

LINCOLN MEMORIAL HIGHWAY. The Lincoln memorial highway, leading from the city of Washington to Gettysburg, a distance of 72 miles, was proposed in 1908 in commemoration of President Lincoln. It was the purpose to make the road 150 feet wide, with two 50-foot roads, and space for an electric line of 50 feet as well. The cost was estimated at \$7,000,000.

LINDSEY, BENJAMIN BARR. An American jurist, judge of the County Court and Juvenile Court at Denver, was born in Jackson, Tenn., on November 25th, 1869. His family was impoverished by the Civil War and removed to Denver, where the father died. To help support the family he sold papers in the morning, worked as an office boy in a lawyer's office during the day and as janitor in the evening. He read law, and presently was admitted to the bar. He became judge of the County Court and Juvenile Court of Denver on January 1st, 1900, and since that time has been remarkably successful in his treatment of juvenile offenders. He organized the Little Citizens' League, composed of the boys of Denver, and was responsible for the enactment by the Colorado Legislature of a contributory delinquency law, under which parents and employers are held responsible for the neglect of children. He was unsuccessful as Democratic candidate for Governor in 1906, but his sweeping victory, over both the old party organizations, in November, 1908, was one of the most striking political events of the year. See PRESIDENTIAL CAMPAIGN, Results of the Election.

LINEVITCH, NICHOLAS PETROVITCH. A Russian general, commander-in-chief of the Russian forces in Manchuria in the war with Japan, died at Saint Petersburg on April 23d, 1908. He was

a native of Tcheringoff and entered the army at the age of seventeen, the time of the first Crimean War, and fought in the Caucasus against the Turks, and, later, against the Circassians. He won distinction at Khiva, while with General Skobelev's command, and in 1869 was made a captain. For his services during the war with Turkey (1877-78) he was rewarded with a Colonelcy and the Cross of Saint George. He served ten years in Transcaspiya as commander of a rifle brigade and in 1895 was transferred to the Far East, where, in 1900, he was put in command of the first Siberian Army Corps, taking charge of the campaign against the Boxers and of the expedition for the relief of the Peking legations. During the war with Japan he commanded the First Manchurian Army until after the battle of Mukden, when he superseded General Kuropatkin as commander-in-chief. While peace negotiations were being carried on he was engaged in drilling his army and succeeded in bringing it up to a high point of efficiency, for which he received the appointment of general aide-de-camp.

LIPPMANN, GABRIEL. A French physicist, who was awarded the Nobel Prize for Physics, in December, 1908. He was born in Hollerich, Luxembourg, on August 16th, 1845, studied at the Ecole Normale, in Paris, and then in Germany, where he specialized in physics. In 1875 he was awarded his doctor's degree for his remarkable thesis, *Relation entre les phénomènes électriques et capillaires*. He described the principle of the conservation of electricity, and in 1891 discovered a process for photographing in colors. He was appointed a professor of mathematics and physics in the University of Paris in 1883, and in 1886 took the chair of experimental physics there. In the latter year he was elected to the Academy of Sciences. His publications include *Cours de thermodynamique* (1888); *Cours d'acoustique* (1888), and other technical works.

LIQUORS, FERMENTED AND DISTILLED. These products should be classed under three general heads: (1) wines, products made by the fermentation of fruit juices; (2) malt liquors, fermented beverages made from grains or starchy material with the aid of malt; and (3) distilled liquors, prepared by the distillation of any fermented liquor.

WINES. During the year 1908 there was little of interest or importance in connection with wines. The following table shows the production of sweet wine and the amount of brandy used in its fortification during the past four years:

Year ended June 30	Tax gallon brandy used	Wine gallons wine fortified.	
		Before fortification	After fortification
1905.....	3,430,819	11,992,554	13,990,055
1906.....	3,123,748	10,325,317	12,077,573
1907.....	4,080,774	13,894,536	16,241,900
1908.....	4,380,016	14,601,975	17,119,261

These figures show a considerable increase in the production of both wine and brandy during the past year. Of the total production of 17,119,261 gallons, 16,591,168 gallons were produced in California, and practically the total increase in production was in that State, showing that

the sweet wine law is of practically no value to the other sweet wine producing States.

MALT LIQUORS. During the year 1908 official standards and definitions of malt liquors were adopted by the Association of Official Agricultural Chemists, which in brief are as follows:

1. *Malt liquor* is a beverage made by the alcoholic fermentation of an infusion in potable water, of barley malt and hops, with or without unmalted grains, decorticated and degerminated grains.

2. *Beer* is a malt liquor produced by bottom fermentation.

3. *Lager beer, stored beer*, is beer which has been stored in casks for a period of at least three months.

4. *Malted beer* is beer made of an infusion, in potable water, of barley malt and hops.

5. *Ale* is a malt liquor produced by top fermentation.

6. *Porter and Stout* are varieties of malt liquors made in part from highly roasted malt.

These definitions and standards were adopted after a lengthy hearing at which the manufacturers submitted their evidence, and it was believed that undoubtedly they would be of value, giving more definite meaning to the terms used by the trade. The production of fermented malt liquors during the year 1908 shows only a slight increase over the previous year, the total production being 58,747,680 barrels, as against 58,546,111 barrels in 1907.

DISTILLED SPIRITS. The statistics of the production of distilled spirits in the United States showed that there was a very considerable decrease in production during the year 1908 as compared with previous years. In 1908, 126,989,740.1 gallons were produced, as against 168,573,-

913 gallons in 1907, a decrease of 42,309,948 gallons. This decrease in production is distributed among the kinds of spirits as shown in the following table:

Decrease in	Tax gallons
Bourbon whisky	18,970,306.7
Rye whisky	9,962,328.1
Rum	126,485.4
Gin	190,934.9
High wines	74,873.0
High-proof, pure, neutral, or cologne spirits	9,867,031.1
Miscellaneous	3,117,988.8
Total decrease	42,309,948.0

This decrease in production, in the opinion of the Commissioner of Internal Revenue, was due to a number of causes, among them the extension of the prohibition movement, the very high price of grain, lack of demand for high-proof spirits, and an agreement between distillers to curtail production. There was also a decrease of tax-paid withdrawals during the year to the amount of 14,327,472 gallons, which was largely high-proof or neutral or cologne spirits. This decrease in withdrawals was believed by the Commissioner of Internal Revenue to be somewhat due to the prohibition movement, and also to the unsettled condition of the trade as to the proper marking and branding of certain products under the Food and Drugs Act, the trade waiting for a final decision on certain points.

The following table from the report of the Commissioner of Internal Revenue, 1908, shows the production of spirits of all kinds for the past five years, demonstrating what a marked decrease there has been in the production of all kinds of distilled spirits during the year 1908.

Fiscal year ended June 30	Distillery Warehouses									
	Special bonded warehouses	Fruit brandy (a)	Bourbon whisky	Rye whisky	Alcohol	Rum	Gin	High Wines	Pure, neutral or cologne spirits (b)	Miscellaneous
1904...	1,710,218.1	20,247,089.2	18,371,344.7	11,486,082.4	1,801,179.0	2,110,215.9	309,990.2	57,997,506.1	21,988,544.5	136,022,170.1
1905...	2,313,221.3	26,742,168.2	20,410,422.0	11,610,799.0	1,791,987.2	2,187,709.6	192,066.6	60,944,810.8	23,930,830.9	150,124,015.6
1906...	1,516,309.4	24,968,942.7	21,469,720.5	11,173,614.0	1,730,101.8	2,323,289.2	179,312.7	59,626,733.3	24,194,410.9	147,182,434.5
1907...	2,240,277.0	33,090,791.1	23,550,195.7	16,123,379.1	2,022,407.4	2,947,687.7	124,935.4	60,802,852.3	29,911,664.5	170,814,190.2
1908...	2,670,462.3	14,120,484.4	13,587,867.6	16,849,154.0	1,895,922.0	2,756,752.8	50,062.4	50,935,821.2	26,793,675.7	129,660,202.4

(a) This does not show brandy redeposited, but shows brandy produced and deposited in special bonded warehouses.

(b) Includes high proof spirits in 1903-04.

In the production of the spirits manufactured in 1908, 2,974,853 bushels of malt were used, as against 4,440,315 bushels in 1907; 3,755,519 bushels of rye, as against 6,250,898 in 1907; 17,383,724 bushels of corn, as against 23,474,509 in 1907; showing a decrease of 10,064,698 bushels of grain for 1908.

During the year 1908 a number of very interesting controversies arose in this country and in England under the food laws as to the proper labeling of the various kinds of distilled spirits. A Royal Commission was appointed in England to consider this question, and very extended hearings were given and a large amount of evidence taken as to what was whisky, but up to the end of the year no decision had been rendered, the only report made being in the nature of a preliminary report, which is as follows:

"1. That no restrictions should be placed upon the processes of, or apparatus used in, the distillation of any spirit to which the term 'whisky' may be applied as a trade description.

"2. That the term 'whisky' having been recognized in the past as applicable to a potable spirit manufactured from (1) malt, or (2) malt and unmalted barley or other cereals, the application of the term 'whisky' should not be denied to the product manufactured from such materials.

"We reserve for further consideration the question of the advisability or otherwise of attaching special significance to particular designations such as 'Scotch whisky,' 'Irish whisky,' 'Grain whisky,' and 'Malt whisky,' of placing restrictions upon the use of such designations as trade descriptions; or of requiring such

designations to be used in connection with the sale of whisky."

This, it can be seen, meant practically nothing as far as conditions existed in the United States, as there never had been any controversy as to the use of other grains than malt, or other types of stills than the pot still. In the United States a very interesting condition of affairs arose in connection with the issuing of new regulations by the Bureau of Internal Revenue as to the marking of both distillers' and rectifiers' packages. The important regulations were as follows:

"**DISTILLERS' PACKAGES.** Alcohol. (a) All forms of distilled spirits from which the substances congeneric with ethyl alcohol have been removed for practical purposes altogether, and which have been heretofore marked as 'pure, neutral, or cologne spirits,' will be marked 'alcohol.' (b) That product which has been commercially known as 'alcohol,' from which these congeneric substances have not been removed, will be marked 'commercial alcohol.'

"*Spirits*, as the case may be. The products of distillation in which, by reason of the original material used and the methods of distillation employed, the characteristic substances congeneric with alcohol have been retained, which differentiate them into various forms of potable spirits—such as whisky, brandy, rum, and gin—will be marked with the particular name of such potable spirit, as the case may be, without other description and without the addition of any adjective or descriptive word whatsoever; and the name of such particular spirit will be used even although when any of such spirits may be drawn from the receiving cisterns into casks certain congeneric products of distillation have not been changed by aging or otherwise, so as to bring them to the potable form in which they are ultimately to be placed upon the market, provided such spirits have, before being drawn into the casks, been diluted to potable proof so as to then constitute a crude form of potable spirits.

"**RECTIFIERS' PACKAGES.** A mixture of a particular kind of such potable spirits with alcohol, provided there is enough of such potable spirits to make it a real compound, and not the mere semblance of one, will be marked as a 'compound of' such spirit, with the distillate with which it is mixed—as, for example, 'a compound of whisky and grain distillate'; or, if preferred, with the particular name of such spirit 'compounded with' such other distillate—as, for example, 'whisky, compounded with grain distillate.'

"Alcohol, commercial alcohol, or high wines, which have been manipulated by the aid of artificial flavors, colors, or extracts, or otherwise, so as to resemble some particular kind of potable spirits, will be marked with the name of such spirits, preceded by the word 'imitation'—as, for example, 'imitation whisky.'"

These regulations, which went into effect July 1st, 1908, were bitterly fought by the distillers and rectifiers, injunction suits being brought against the Collectors of Internal Revenue at Cincinnati, Ohio, and Peoria, Ill., and other places, to prevent them from enforcing the regulations.

The particular regulation most bitterly assailed was the one holding that alcohol diluted to 100 proof, colored and flavored, must be labeled

"imitation whisky," "rum" or "brandy," as the case might be.

The first case was brought in Cincinnati, and an enormous amount of evidence was submitted by the government, and Judge Thompson, after hearing the evidence, refused to grant a temporary injunction, and rendered a written decision holding that such a product was correctly branded "imitation whisky." The next case was brought at Springfield before Judge Humphrey, where again voluminous evidence was submitted in the form of affidavits by both sides, but again the decision was against the rectifiers, and again a written decision was handed down by the Judge. In this decision the Judge holds that whisky is not a like substance with alcohol or neutral spirits, being made with entirely different objects and by different methods, whisky being a distilled spirit from grain in every step in the preparation of which an effort is made to produce or preserve the desired flavors which give it its character when it is matured, while with alcohol the opposite is the effort, each step being taken to produce a large amount of alcohol without any taste or flavor. These two sweeping decisions in defense of the regulations have practically settled this part of the controversy. Still other cases were pending in the courts on other points raised under the Food and Drugs Act, but so far the decision of the Attorney General as to what is whisky has been sustained. Another interesting case under the Food and Drugs Act was the seizure of a number of barrels of liquor labeled "Bourbon Whiskey," but made from molasses. The decision in this case was that whisky must be made from grain, and that Bourbon whisky is the product of Kentucky.

The Association of Official Agricultural Chemists and the Association of Dairy and Food Chemists, during the year, issued definitions and standards for various distilled spirits, these being adopted after an extended study of the question and many hearings on the subject. These standards in brief were as follows:

1. *Distilled spirit* is the distillate obtained from a fermented mash of cereals, molasses, sugars, fruits or other fermentable substance, and contains all the volatile flavors, essential oils and other substances derived directly from the materials used, and the higher alcohols, ethers, acids and other volatile bodies congeneric with ethyl alcohol produced during fermentation, which are carried over at the ordinary temperature of distillation and the principal part of which is higher alcohols estimated as amylac.

2. *Alcohol, cologne spirits, neutral spirit, velvet spirit, or silent spirit*, is distilled spirit from which all, or practically all, of its constituents except ethyl alcohol and water are separated, and contains not less than 94.9 per cent. (189.8 proof) by volume of ethyl alcohol.

3. *New whisky* is the properly distilled spirit from the properly prepared and properly fermented mash of malted grain, or of grain the starch of which has been hydrolyzed by malt.

Whisky (potable whisky) is a new whisky which has been stored in wood not less than four years without any artificial heat save that which may be imparted by warming the storehouse to the usual temperature.

4. *Rye whisky* is whisky in the manufacture of which rye, either in the malted condition or

with sufficient barley or rye malt to hydrolyze the starch, is the only grain used.

6. *Bourbon whisky* is a whisky made in Kentucky from a mash of Indian corn and rye and barley malt, of which Indian corn forms more than 50 per cent.

7. *Corn whisky* is whisky made from malted Indian corn, or of Indian corn the starch of which has been hydrolyzed by malt.

8. *Blended whisky* is a mixture of two or more whiskys.

9. *Scotch whisky* is whisky made in Scotland solely from barley malt, in the drying of which peat has been used.

10. *Irish whisky* is whisky made in Ireland.

11. *New rum* is the properly distilled spirit made from the properly fermented clean, sound juice of the sugar cane, the clean, sound massecuite made therefrom, or any sound, clean intermediate product save sugar.

12. *Rum* (*potable rum*) is new rum stored not less than four years in wood without any artificial heat save that which may be imparted by the warming of the storehouse to the usual temperature.

13. *New brandy* is the properly distilled spirit made from wine.

14. *Brandy* (*potable brandy*) is new brandy stored in wood for not less than four years without any artificial heat save that which may be imparted by the warming of the storehouse to the usual temperature.

16. *Cognac, cognac brandy*, is the brandy produced in the departments of the Charente and the Charente Inférieure, France, from wine produced in those departments.

LITERATURE, ENGLISH AND AMERICAN. There were published in the United States in 1908 9,254 new books, and 509 new editions, and in England 7,512 new books, and 2,309 new editions.

No attempt will be made in the following discussion to separate the American from the English books, for in the case of books worth considering the only difference at the most is a few months' delay in the date of appearance. Of 9,254 books appearing in the United States in 1908, of traceable origin, 5,349 were by American authors, 1,145 were by English or other foreign authors reprinted in the United States, and 1,760 were imported ready printed. For 1907 the corresponding figures had been 6,517 American, 1,319 reprints and 1,784 imported.

Fiction. As is shown by the above table there was a decided falling off in the total number of books appearing in 1908 as compared with 1907, the high water mark of the publishing business, and almost every class shows a decreased output except fiction which is far higher than ever before. It cannot be said, however, that there is any corresponding advance in the quality, either of the general average or of the most successful of the novels of the year. The best index of the popular taste in fiction is given by the reports of the book trade in all parts of the United States, compiled by the *Bookman*. According to this the best selling novels of 1908 were the following, arranged approximately in the order of popularity: *The Shuttle*, by Frances Hodgson Burnett; *The Weavers*, by Sir Gilbert Parker; *The Lady of the Decoration*, by Frances Little; *The Barrier*, by Rex E. Beach; *Mr. Crewe's Career*, by Winston Churchill; *The Black Bag*, by Louis Vance; *The Coast of Chance*, by

Esther and Lucia Chamberlain; *The Lure of the Mask*, by Harold MacGrath; *The Daughter of Anderson Crow*, by George Barr McCutcheon; *The Ancient Law*, by Ellen Glasgow; *Somehow Good*, by William F. De Morgan; *Old Wives for New*, by David Graham Phillips; *The Husbands of Edith*, by George Barr McCutcheon; *Halfway House*, by Maurice Hewlett; *The Firing Line*, by Robert W. Chambers; *Together*, by Robert Herrick; *The Man from Brodney's*, by George Barr McCutcheon; *The Little Brown Jug at Kildare*, by Meredith Nicholson; *Peter*, by F. Hopkinson Smith; *The Fruit of the Tree*, by Edith Wharton; *Satan Sanderson*, by Hallie Erminie Rives; *The Old Peabody Pew*, by Kate Douglas Wiggin; *Three Weeks*, by Elinor Glyn; *Rosalind at Red Gate*, by Meredith Nicholson; *The Great Secret*, by Edward Phillips Oppenheim; *The Fair Moon of Bath*, by Elizabeth Ellis; *The Primadonna*, by F. Marion Crawford; *Rose MacLeod*, by Alice Brown; *The Chaperon*, by C. N. and A. M. Williamson; *The Wayfarers*, by Mary Stewart Cutting; *The Post Girl*, by Edward C. Booth; *The Circular Staircase*, by Mary R. Rinehart; *Lewis Rand*, by Mary Johnston; *The Testing of Diana Mallory*, by Mrs. Humphry Ward; *The Trail of the Lonesome Pine*, by John Fox, Jr.

Of these, *The Shuttle*, *The Weavers*, *The Lady of the Decoration*, *The Old Peabody Pew*, *The Daughter of Anderson Crow*, *Three Weeks* and *The Fruit of the Tree* were also among the "best sellers" of 1907. Of the 38 authors of the popular novels of 1908 there were 22 men and 16 women, a much more even division than in 1907 when the figures were 25 to 7. Leaving out Sir Gilbert Parker, Mrs. Burnett and Mrs. Williamson, whom both continents claim, 28 of these novelists were American and 7 English. These two facts are indicative of present tendencies: the increase in the number of women who are successful in fiction and the preference shown in the United States for native novels. Among the importations, however, are some of the best books of the year. We have, for example, no American novel in the list that compares in workmanship and comprehensiveness with *The Testing of Diana Mallory*, which has a wider human interest than Mrs. Ward's political fiction. Nor have we any author to class with De Morgan in the gossipy, garrulous romance of the old-fashioned sort. It is supposed that the taste of the day will tolerate only short, swift and straightforward narratives, but De Morgan disregards all these and gains the affection of his readers for all his characters by the loving care with which he delineates them. *Somehow Good* has the characteristic style of Joseph Vance and *Alice-for-Short*, but strikes a deeper note through the optimistic philosophy implied in the title. Many of the successful novels are practically continuations of former successes. In *Coniston* Mr. Churchill showed how railroad interests may dominate a state and in *Mr. Crewe's Career* a more advanced stage of political corruption is depicted. *The Red City* is a sequel to *Hugh Wynne* during Washington's second administration. With *The Diva's Ruby* F. Marion Crawford completes the story of an operatic career of which the earlier part was told in *Fair Margaret* and *The Prima donna*. *The Barrier* follows closely the lines of Rex Beach's former Alaskan melodrama *The Spoilers*. *The Shoulders of Atlas* is, like the other works of Mary E.

JOEL CHANDLER HARRIS

DONALD G. MITCHELL

CHARLES ELIOT NORTON

EDMUND CLARENCE STEDMAN

Wilkins Freeman, a New England story, distinguished by the delicate handling of a difficult character, a morbidly passionate young girl. In another story of the same region and style, *Rose MacLeod*, the most interesting character is not the titular heroine but a delightful old lady who forges memoirs. *Weeping Cross* by Henry Longan Stuart is a tragic romance of colonial days in Massachusetts written with a vigor and intensity seldom found in historical novels of any period. *The Climber* by E. F. Benson narrates the rise and fall of a heartless social aspirant, who talks the language of the author's first popular heroine "Dodo."

The tendency to disregard the conventional limitations of American fiction is exemplified in Robert Herrick's *Together* and David Graham Phillips's *Old Wives for New*, both exposing frankly the intimacies of married life. Another attempted solution of the marriage question is *Santa Lucia: A Common Story*, by Mary Hunter Austin, author of *The Land of Little Rain*. In *The Firing Line*, as in his former novel *The Younger Set*, Robert Chambers opposes divorce. Mr. Hewlett's *Halfway House* is a Meredithian romance of an ill-assorted couple.

It is interesting to note the recrudescence of symbolism in recent fiction as well as in the drama. The best examples of this are: *The Passing of the Third Floor Back* by Jerome K. Jerome, a tenderly whimsical story of a Bloomsbury boarding house redeemed by a gentle guest; *William Jordan, Jr.* by John C. Snaith, the sufferings of a genius in an alien world; *The Old Room*, a translation from the Danish of the late Carl Ewald, the eternal struggle between the old and the new; and *The Man Who Was Thursday*, a phantasmagoria of humor, paradox, adventure and allegory, by G. K. Chesterton. We have, as usual, a good group of Southern novels, of which *The Trail of the Lonesome Pine* by John Fox, Jr. is easily first, but also worthy of mention are: *Kincaid's Battery* by George W. Cable, *The Fair Mississippian* by Charles Egbert Craddock (Miss Murfree) and *Judith of the Cumberland* by Alice MacGowan. Mrs. Gertrude Atherton's two books, *The Gorgeous Isle* and *The Doomsman*, have their scenes respectively in the West Indies and in California before the American occupation. *Little Brown Brother* by Stanley Portal Hyatt deals with the Philippine question. Robert Hichens supplies a sequel to his Neapolitan romance *The Call of the Blood* in *A Spirit in Prison*, set sixteen years later.

There are many novels with a socialistic aim, the most important of which are: *The Metropolis* and *The Moneychangers* by Upton Sinclair, complementary to *The Jungle* and showing the extravagance of luxury; *The Iron Heel* by Jack London, a lurid prophecy of a coming war of the classes; and *The War in the Air* by H. G. Wells, an anti-military romance. Marie Corelli in *Holy Orders* inveighs against yellow journalism, the drink evil and many other things. Two sombre novels of prison life and its effects are: *9009* by James Hopper and Fred R. Becholdt, and *The Ancient Law* by Ellen Glasgow. *An Immortal Soul* by W. H. Mallock and *The Guest of Quesnay* by Booth Tarkington have double personality for their theme. *The Mother of the Man* is the most powerful of Eden Phillpotts's Dartmoor romances. William Dean Howells contributes to this year's list only a sentimental psychological sketch, *Fennel and Rue*. Edith Wharton gives us

a volume of short stories, *The Hermit and the Wild Woman*. The unraveling of mysteries by detectives, amateur and professional, is as popular a theme as ever. We have mentioned the most successful, i. e., *The Black Bag*, *The Coast of Chance*, *The Lure of the Mask*, *The Circular Staircase*, *The Great Secret*. Other novels of the year which should have special mention are: *Peter* by F. Hopkinson Smith, a gentleman hero of the old-fashioned sort; *The Fly on the Wheel*, by Katherine Cecil Thurston, a powerful but unpleasant story; *The Great Miss Driver*, by Anthony Hope (Hawkins), the career of a masterful woman; *Wroth*, by Agnes and Egerton Castle, written in a style of exaggerated verbal coloring; *Interplay*, by Beatrice Harraden, advocating an equal standard of morality; *Exton Manor*, by Archibald Marshall, a tempest in a village teapot over the deceased wife's sister question; *Seraphica*, by Justin H. McCarthy, a butterfly romance; *A Prophet in Babylon*, by W. J. Dawson, advocating aggressive religious methods; *The Rescuer*, by Percy White; *When the Tide Turns*, by Filson Young; *Lady Noggs Intervenes*, by Edgar Jepson; *Janet of the Dunes*, by Harriet T. Comstock; *Come and Find Me*, by Elizabeth Robins, another Alaska story; *Princess Penniless*, by S. R. Crockett; *The Heart of a Child*, by Frank Danby (Mrs. Julia Frankau); *The Letters of Jennie Allen to Her Friend Miss Musgrove*, by Grace Donworth, and last, the volume of genuinely human humor, *Salhaven*, by W. W. Jacobs.

POETRY AND DRAMA. The most noteworthy poetical event of the year was the publication of the third volume of *The Dynasts*, by Thomas Hardy, completing the great historical drama which he began seven years ago. There has been a marked change in the attitude of the critics toward this ambitious undertaking during its publication. The announcement of the intention to cover the whole period of the Napoleonic wars in a drama of one hundred and thirty or more scenes, with a multitude of speaking parts, including both historical and allegorical personages, aroused much scepticism and not a little derision; but now it is generally recognized that the gigantic task has been worthily performed, that the work as a whole presents an impressive spectacle of this vast tragedy in which all the great nations of Europe were actors, and that there are many passages in it of true poetic inspiration. Among other dramas in verse must be mentioned *The Duke of Gandia*, by Algernon Swinburne; *The House of Rimmon*, by Henry Van Dyke; a translation of Hauptmann's *Hannele*, by Charles Henry Meltzer; and a free stage adaptation of Goethe's *Faust*, by Stephen Phillips and J. Comyns Carr. The reading of plays is evidently becoming popular in America as it has been in France. Most prominent among the published prose plays are two by Charles Rann Kennedy, *The Servant in the House*, which introduces a character symbolic of Christ, and *The Winterfeast*, which did not attain the success of the former on the stage. Other published plays that should be mentioned are: Percy Mackaye's *Mater and The Scarecrow*; *The Man from Home*, by Booth Tarkington and Harry Leon Wilson, and *The Worth of a Woman*, by David Graham Phillips. In this connection may best be mentioned two volumes of dramatic criticism: *Other Days*, by William Winter, and *The American Stage of To-day*, by Walter Pritchard

Eaton; three biographies, *The Life of Henry Irving*, by Austin Brereton; *Richard Mansfield*, by Paul Wilstach, and *The Story of My Life*, by Ellen Terry; *Henrik Ibsen: the Man and His Plays*, by Montrose J. Moses; *Elizabethan Drama, 1558-1642*, in two volumes, by Felix E. Schelling; *The Appreciation of the Drama*, by Charles H. Caffin.

Among the volumes of poetry appearing during the year should be noted: *Drake: An English Epio*, by Alfred Noyes; *New Poems*, by Stephen Phillips; *The Autumn Garden*, by Edmund Gosse; *Narcissus and Other Poems*, by Grace Denio Litchfield; *The Golden Hynde and Other Poems*, by Alfred Noyes; *The Call of Dawn and Other Poems*, by Esmé C. Wingfield-Stratford; *The Book of the Little Past*, by Josephine Preston Peabody; *Omar Repentant*, by Richard Le Gallienne, and *Lyrics of Lowly Life*, by the late Paul Laurence Dunbar.

LITERARY HISTORY, CRITICISM AND BIOGRAPHY. First place here should be given to *The New English Dictionary on Historical Principles*, commonly known as the "Oxford Dictionary," of which the sixth volume has been issued completing the letter M. The editors are James H. H. Murray, Henry Bradley and W. A. Craigie, assisted by numerous scholars and readers in England and the United States. Its pages measure 13½ by 10½ inches and it indexes about twice as many words as the Century Dictionary, hitherto the largest, and has ten times as many illustrative quotations. As far as possible a quotation is given from each century of the use of a word in a particular sense. Another extensive work is the *Cambridge History of English Literature*, in fourteen volumes, of which the third, dealing with the Renaissance and the Reformation, has appeared. It will cover the whole course of English literature from Beowulf to the Victorian Age, giving an account of the successive movements, the progress of the language, the influence of foreign literature, and comprehensive bibliographies. The chapters are written by different specialists under the editorship of A. W. Ward. Another *History of English Literature* is by William Robertson Nicoll and Thomas Secombe.

Of unique literary interest is the publication, by the Carnegie Institution of Washington, of a complete photo-reproduction of *The Old Yellow Book*, the source of Browning's "The Ring and the Book," with translation, essay and notes by Charles W. Hodell. The second volume of George Saintsbury's *History of English Prosody*, from the twelfth century to the present day, appeared in 1908. Also, the fifth volume of Paul Elmer More's *Snelburne Essays: The Standard of Usage in English*, by Thomas R. Lounsbury, is a lively attack upon the pedantry of the purists. Similar in point of view is *Inquiries and Opinions*, by Brander Matthews. Other collections of essays, literary and personal, are: *The Age of Shakespeare*, by Algernon C. Swinburne; *Technique of the Novel*, by Charles F. Horne; *Magazine Writing and the New Literature*, by Henry Mills Alden, editor of *Harper's Magazine*; *Park Street Papers*, by Bliss Perry, editor of *The Atlantic*; *De Libris, Prose and Verse*, by Austin Dobson; *A Chronicle of Friendships*, by Will H. Low; *A Happy Half-Century*, by Agnes Repplier; *In a New Century*, by E. S. Martin; *At Large*, by Arthur C. Benson; *Leaf and Tendril*, by John Burroughs; *The Open Window: Tales of the Months*, by Mabel Osgood Wright;

and *Adventures in Contentment*, by David Grayson.

Of literary biographies there were none of supreme distinction in 1908, but the following are noteworthy: *Lucretius, Epicurean and Poet*, by John Masson; *Petrarch, His Life and Times*, by H. C. Hollway Calthrop; *Thomas Chatterton, the Marvelous Boy*, by Charles E. Russell; *John Keats, a Literary Biography*, by Albert E. Hancock; *Edgar Allan Poe*, by John E. Macy; *Concerning Lafcadio Hearn*, by George M. Gould; *The Life of Thomas Bailey Aldrich*, by Ferris Greenslet; *William Morris*, by Alfred Noyes; *Queen of Letter Writers, Marquise de Sévigné*, by Janet Aldis; *Letters of Samuel Reynolds Hole*, by G. A. B. Dewar; *The Letters of Edward Lear*, by Lady Strachey; and the *Letters of Wordsworth's Family, from 1787 to 1855*, edited by W. Knight.

HISTORY. Although there was no falling off in the number of histories published in 1908, there were not so many noteworthy works as in the preceding year. One new volume of *The Cambridge Modern History*, projected by the late Lord Acton and written by associated scholars, was published, Vol. V., treating of the age of Louis XIV. and including a chapter on the Colonies and India. Sir George Otto Trevelyan's *History of the American Revolution* has reached its third part and the year 1778. Sydney George Fisher's *Struggle for American Independence* is original and interesting, although by no means so comprehensive and judicial as Trevelyan's.

Among the Canadian histories called forth by the anniversary pageants, may be noted: *The Tercentenary History of Canada*, from Champlain to Laurier, a comprehensive compilation by Frank B. Tracy, in three volumes; *The Making of Canada*, by A. G. Bradley, more brilliantly written; *Canadian Types of the Old Régime, 1608-1698*, by Charles W. Colby; *The Conquest of the Great Northwest*, the story of the Hudson's Bay Company, by Agnes C. Laut. We must include the names of two notable Italian histories which appear in English translations: Pompeo Gherardo Molmenti's *Venice*, its individual growth from the earliest beginnings to the fall of the republic, in six volumes, translated by Horatio F. Brown, a scholarly and comprehensive piece of work; and *The Greatness and Decline of Rome*, by Guglielmo Ferrero, whose lecture tour in America added interest to his original and somewhat iconoclastic treatment of well-worn themes. Under the title of *The Latins in the Levant*, William Miller gives a careful study of Frankish Greece after the Fourth Crusade. New light on recent events in Russia is thrown by *The Coming Struggle in Central Asia*, by B. L. Putnam Weale (pseud. for Bertram Lenox Simpson); *The Year in Russia*, by Maurice Baring; *The Tragedy of Russia in Pacific Asia*, by Frederick McCormick, and *Russia's Message, the Import of the Revolution*, by William English Walling. Other historical works of the year are: *The Mongols in Russia*, by the late Jeremiah Curtin, a continuation of his book *The Mongols*, of last year; *The Russian Conquest of the Caucasus*, by John F. Baddeley; *Studies in the History of Venice*, by Horatio F. Brown; *Dumouriez and the Defense of England Against Napoleon I.*, by J. H. Rose; *Ancient Britain and the Invasions of Julius Cæsar*, by T. R. E. Holmes; *Wisconsin, the Americanization of a French Settlement*, by Reuben Gold Thwaites; *Minnesota*, by W. Watts Folwell; *The Witch-*

craft Delusion in Colonial Connecticut, 1647 to 1697, by John M. Taylor; *The Campaign of Santiago de Cuba*, by Herbert Howland Sargent; *Mexico of the Twentieth Century*, by Percy Falcke Martin; *The Story of the Guides*, by George John Younghusband; the second volume of Edward Channing's *History of the United States* brings it down to 1760. *The Story of a Street*, a narrative history of Wall Street from 1644 to 1908, by Frederick Trevor Hill.

BIOGRAPHY. The centenary of the births of Abraham Lincoln, Charles Darwin and Edgar Allan Poe brought out a flood of biographical literature, but in fields so well worked little new material remained to be discovered. In fact the year's record contains no eminent works in biographical literature. One which was most favorably received as a successful accomplishment of a delicate task is *The Life of Alice Freeman Palmer*, President of Wellesley College, by her husband, George Herbert Palmer. This reminds one of an English biography, inferior to it from a literary point of view, *The Life of Dorothy Beale*, Head-Mistress of Cheltenham College, by Elizabeth Raikes. Herbert Spencer's *Autobiography* was supplemented in 1908 according to the request expressed in his will by *The Life and Letters of Herbert Spencer*, by David Duncan, a creditable work in two volumes. Other English biographies and memoirs of interest are the following: *The Life of Gilbert Burnet*, Bishop of Salisbury, by T. E. S. Clark; *The First George in Hanover and England*, by Lewis Melville; *William the Conqueror and the Rule of the Normans*, by Frank Merry Stenton; *Two English Queens and Philip*, by Martin Hume; *John Thaddeus DeLanc*, Editor of "The Times," *His Life and Correspondence*, by Arthur Irwin Dasent; *Memoirs of Eight Parliaments*, by Henry W. Lucy; *Rambling Recollections*, by Sir Henry Drummond Wolff; *Memoirs of Half a Century*, by R. C. Lehman; *The Holland House Circle*, by Lloyd Sanders; *Reminiscences*, by Lady Randolph Churchill; *The Story of a Beautiful Duchess*, Elizabeth Gunning, Duchess of Hamilton and Argyll, by Horace Bleakley; *Love Letters of Mary Wollstonecroft*, Introduction by Roger Ingpen.

In American biography we have the third volume of *The Reminiscences of Carl Schurz*, 1863-1869, left incomplete at his death, and supplemented by a sketch of his life and public services from 1869 to 1906, by Frederic Bancroft and William A. Dunning; *The Letters of Mrs. James G. Blaine* in two volumes, edited by Harriet S. Blaine Beale; *Stephen A. Douglas*, by Allen Johnson; *The Life and Public Services of William Pitt Fessenden*, by Francis Fessenden; *Thomas Alva Edison*, by Francis Arthur Jones. In the field of French biography we have Andrew Lang's life of Joan of Arc, *The Maid of France*, and four books on Napoleon and the French Revolution. *Napoleon and the Archduke Charles*, by F. Lorraine Petre; *Napoleon*, by J. T. Herbert Bailly; *Danton and the French Revolution*, by Charles F. Warwick; *The Princess de Lamballe*, by B. C. Hardy. In the field of the fine arts should be noted *The Life of James McNeill Whistler*, by E. R. and J. Pennell; *Musical Memories*, recollections of the celebrities of the half-century, 1850 to 1900, by George P. Upton; *The Life of Beethoven*, by Alice M. Diehl, and *Lorenzo the Magnificent and Florence in Her Golden Age*, by E. L. S. Horsburgh.

POLITICAL AND SOCIAL SCIENCE. One of the most important contributions to English civics of this or of many years is the *Government of England*, by A. Lawrence Lowell. This was at once recognized on both sides of the Atlantic as a thoroughly competent study of the political system of Great Britain, comparable only to Bryce's *American Commonwealth* for accuracy and literary skill in the handling of an immense mass of difficult material. Two authoritative works on international politics resulting from the exchange of professors between American and European universities, are the lectures given by Archibald Cary Coolidge at the Paris Sorbonne on *The United States as a World Power*; and those given by André Tardieu at Harvard University on *France and the Alliances*, a discussion of the diplomatic history of France since the Franco-Prussian War. The lectures given in 1887-88, by Frederick William Maitland, on *The Constitutional History of England*, were edited by Herbert Fisher. A collection of addresses by William Howard Taft was published under the title, *Present Day Problems*. A similar title, *Problems of To-Day*, was chosen by Andrew Carnegie for the volume in which he expresses his views on wealth, labor, wages, thrift, the land, Socialism, etc. *The Trust Movement in British Industry*, by William Henry Macrosty, is an admirable survey of the subject. *The Essentials of Economic Theory as Applied to Modern Problems of Industry and Public Policy*, by John Bates Clark of Columbia University, is recognized as an original and able contribution to the discussion of current questions. In *Sin and Society*, Edward Alsworth Ross discusses, in his usual epigrammatic and brilliant style, certain new "smokeless sins" which do more harm to society than the universally reprobated vices. Professor Ross's *Social Psychology*, although intended as a text-book, is almost equally readable. From the other side of the Atlantic comes a book with a similar title but very different style and content, *An Introduction to Social Psychology*, by William McDougal. An unusual number of studies of various phases of the negro problem have appeared; among them: *Following the Color Line*, by Ray Stannard Baker; *Race Adjustment*, by Kelly Miller; *Race Questions, Provincialism and Other American Problems*, by Josiah Royce; and *Studies in the American Race Problem*, by A. H. Stone. There are three volumes on the tramp: *The Elimination of the Tramp*, by Edmond Kelly, advocating labor colonies on the European plan; the practical experiences of Josiah Flynt, published in *My Life*; and of Jack London in *The Record*. Two cleverly written books representing opposing standpoints are H. G. Wells' *New Worlds for Old*, and W. H. Mallock's *Critical Examination of Socialism*. *The Young Malefactor*, by Thomas Travis, is a useful study of juvenile delinquency. Other volumes which should be mentioned here are: *The Lamb Slain from the Foundation of the World*, by Richard Heath, the sufferings of mankind throughout history; *Justice and Liberty*, by G. Lowes Dickinson, a political dialogue; *The Cry of the Children*, by Bessie Van Vorst; *Weepers in Play Time*, by Beatrice Sands; *The Money God*, by John C. Van Dyke, and *Money Hunger*, by Henry Wood; *The American As He Is*, by Nicholas Murray Butler, President of Columbia, lectures before the University of Copenhagen; and *The Home Builder*, by Lyman Abbott.

RELIGION AND PHILOSOPHY. A marked feature of the religious literature of recent years is the production of encyclopedic works. James Hastings, who not long ago edited a *Dictionary of the Bible*, which has for its only rival Cheyne's *Encyclopædia Biblica*, has completed, with the assistance of J. A. Selbie, a *Dictionary of Christ and the Gospels*, in two large volumes; and the same editors have begun the publication of an *Encyclopædia of Religion and Ethics*, with the assistance of many other scholars. The aim of the encyclopædia will be to give an account of all the great and small religions of the world and of the ethical and philosophical theories connected with them. It will be completed in ten or twelve volumes of more than 900 pages each. A similar work of which the first volume has also appeared is *The New Schaff-Herzog Encyclopædia of Religious Knowledge*, embracing Biblical, historical, doctrinal and practical theology and Biblical, theological, and ecclesiastical biography from the earliest times to the present day. This is based on the third edition of the *Real Encyklopädie* of Herzog and Hauck, and is prepared by more than six hundred scholars under the supervision of Samuel Macauley Jackson, C. C. Sherman and G. W. Gilmore. On a similar scale and plan as the great *Jewish Encyclopædia* completed two years ago, we have the *Catholic Encyclopedia*, an international work of reference on the constitution, doctrine, discipline and history of the Catholic Church, edited by Charles G. Herbermann, Edward A. Pace, Condé B. Pallen, Thomas J. Shahan, John J. Wynne, assisted by numerous collaborators. Four volumes have appeared and there are to be fifteen in all, each of about 800 pages, with colored plates and maps and numerous illustrations, altogether some 30,000 articles covering all questions bearing on the origin, constitution and development of the church, as well as on its complex and manifold influences on the intellectual, moral, religious, artistic, social and material progress of the last nineteen hundred years. It presents divergent opinions and the theories of radical critics with great fairness in accordance with the promise of its prospectus that, "In matters on which the church has not delivered a decision the different views of acknowledged authorities will be impartially recorded." In England was published *Murray's Illustrated Bible Dictionary*, edited by Rev. William C. Piercy, much more conservative in its standpoint than Cheyne's or even Hastings'. A well-written and accurate volume on the *Canon and Text of the New Testament* is from the pen of Casper René Gregory, an American who is professor of New Testament exegesis in the theological faculty of the University of Leipsic. G. H. Box's *The Book of Isaiah* is scholarly, clear, fearless and reverent. John M. Thomas, President of Middlebury College, Vt., discusses Biblical problems in the constructive spirit in *The Christian Faith and the Old Testament*. Two large volumes of *Old Testament and Semitic Studies*, comprising twenty-six essays contributed by scholars in fourteen institutions of learning, are published under the editorship of Robert Francis Harper, Francis Brown and George F. Moore, in memory of William Rainey Harper, late President of the University of Chicago, and one of the pioneers in Semitic scholarship in this country. There has been a great deal of controversial literature on modernism since its condemnation by the encyclical of Pius X., of which

may be mentioned: *Medievalism*, by George Tyrrell, a reply to Cardinal Mercier; *Modernism*, by Alfred Leslie Lilley, and two translations: *Modernism*, by Paul Sabatier, from the French, and *The Programme of Modernism*, from the Italian. *Christianity and the Social Order*, by Reginald J. Campbell, of City Temple, London, is representative of many works advocating Socialism from a Christian standpoint. *The Sense of the Infinite* is a study of the transcendental element in literature, life and religion, from Plato to the present, by Oscar Kuhns. Henry C. King, President of Oberlin, deals frankly with the obstacle to faith in the Christian religion in *The Seeming Unreality of the Spiritual Life*. The lectures upon the great thinkers of Greece, from Homer to Plato, by James Adam, are published in *Religious Teachers of Greece*. *Lollardy and the Reformation in England*, by James Gairdner, is a thorough historical survey, but written from a standpoint unsympathetic to the Lollards.

Two notable contributions to ethics are: *The Origin and Development of the Moral Ideas*, by Edward Westermarck, an extensive and able sociological study, of which the second and concluding volume has appeared; and *Ethics*, by John Dewey and James Hayden Tufts, which, though intended primarily as a textbook, attracts the general reader, on account of its lucidity and originality. Other books in this field, of general interest, are: *The Philosophy of Loyalty*, by Josiah Royce, inspiring lectures by one of the foremost philosophers of America; *Personalism*, by Borden Parker Bowne, a plea for personal idealism in philosophy and an enlightened orthodoxy in religion; *The Religion of a Democrat*, by Charles Zueblin, popular lectures of a radical nature; *First and Last Things*, by H. G. Wells, frank expression of personal views on a great variety of topics ranging from metaphysics to marriage; *Orthodoxy*, by G. K. Chesterton, a witty and original argument in defense of Christian orthodoxy, as summarized in the Apostle's Creed, a companion piece to his *Heretics*; two more volumes of the positivist essays of Frederic Harrisson; *The Philosophy of Common Sense*, and *National and Social Problems*. *The Philosophical Basis of Religion*, by John Watson, lectures presenting a rationalistic reconstruction of the history of religious belief; *Psychological Phenomenon of Christianity*, by George Barton Cutten.

The lectures on Pragmatism given at Columbia by Professor William James of Harvard, two years ago, resulted in the production of a large volume of *Essays Philosophical and Psychological*, in his honor, by John Dewey, F. J. E. Woodbridge, Felix Adler, and other members of the Columbia faculty; another volume of Nietzsche's work, *Beyond Good and Evil*, has been translated by Helen Zimmern, and Henry L. Mencken has given in one volume a clear statement of views from the standpoint of a disciple in *The Philosophy of Friedrich Nietzsche. A Mind That Found Itself*, by Clifford W. Beers, is a unique contribution to abnormal psychology, being the experiences of an insane man told after his recovery. *On the Witness Stand*, by Hugo Münsterberg, is an argument for the use of laboratory methods in the court room for testing the credibility of witnesses. The movement started in the Emmanuel Church of Boston, for the cure of nervous disorders by suggestion and religious influences, is described by its leaders, in *Religion and*

Medicine, by Elwood Worcester, Samuel McComb and Isadoré H. Coriat.

A large number of other books have appeared on psychotherapy and the influence of the mind on bodily conditions. The first systematic exposition of the philosophy and theology of Christian Science is Gerhardt C. Mars's *The Interpretation of Life*; and in connection with this may be mentioned an authorized *Life of Mary Baker Eddy*, by Sibyl Wilbur. The revival of interest in spiritistic phenomena is shown by the appearance of numerous books on this and allied topics. Sir Oliver Lodge in *Man and the Universe*, *Religious Studies*, and other volumes, advocates the expansion of science to include what he regards as discoveries in the psychical realm; James H. Hyslop's *Psychical Research and the Resurrection* is the fourth of his volumes on that subject; Hamlin Garland's *The Shadow World* presents recent psychical research in a semi-fictional form; Frank Podmore's *The Naturalization of the Supernatural* is a critical and historical survey of the field.

TRAVEL AND DESCRIPTION. This is the unsatisfactory heading commonly used to include the many books descriptive of various countries at the present time, ranging from mere guide books and jottings of purely personal interest, to thorough studies of geography and recent history. Of the last, the most conspicuous representative is *Modern Egypt*, by Earl Cromer, an admirable account of the regeneration of that country under his administration. Dealing with the same land, but widely different in character, is *Egypt and Its Monuments*, of which the illustrations by Jules Guérin are of more value than the accompanying text by Robert Hichens. Winston Churchill shows that he has not forgotten his former profession in becoming a cabinet officer, by describing his recent trip into Uganda in *My African Journey*. Of European travel Italy, as usual, is most numerously represented. We have a book of sketches by W. D. Howells in his usual delightful style, *Roman Holidays*; the second volume of F. Hamilton Jackson's scholarly work on *The Shores of the Adriatic*, dealing with the Austrian side, the Küstenland, Istria and Dalmatia, especially its archaeology. Here, also, may be mentioned *Herculaneum, Past, Present and Future*, by C. Waldstein and Leonard Shoo-bridge; *Buried Herculaneum*, by Ethel Ross Barker; *The Romance of Roman Villas*, by Elizabeth W. Champney; *The Cathedrals and Churches of Northern Italy*, by T. Francis Bumpus; *The City of Genoa*, by Robert W. Carden; *Italica*, studies in Italian life and letters, by William Roscoe Thayer.

In Asia the most important contributions are from the Carnegie Institution of Washington: two quarto volumes of *Explorations in Turkestan*, by Raphael Pumpelly and others; and five quarto volumes of *Research in China*, by Bailey Willis, Charles D. Walcott and others. Other volumes of Asian travel are: *Out-of-Doors in the Holy Land*, by Henry Van Dyke; *Jerusalem*, by George Adam Smith; *Twenty Years in Persia*, by John C. Wishard; *Persia; the Awakening East*, by W. P. Cresson; *By Desert Ways to Baghdad*, by Louisa Jebb; *A Sketch of the Geography and Geology of the Himalaya Mountains and Tibet*, by Col. S. G. Burrard and H. H. Hayden; *Ice-Bound Heights of the Mustagh*, by W. H. and F. B. Workman; *Burma*, by Sir James George Scott; *In Korea with Marquis Ito*, by George

Trumbull Ladd. In America the most interesting volumes are four narratives of exploring and collecting tours: *A Canyon Voyage*, by Frederick G. Dellenbaugh, describing the Powell expedition down the Green and Colorado rivers 40 years ago; *Camps and Cruises of an Ornithologist*, by Frank M. Chapman; *Camp-Fires on Desert and Lava*, by William T. Hornaday; *Newfoundland and Its Untrodden Ways*, by John Guille Millais. This brief survey must not be concluded without mention of *Alaska*, by Ella Higginson; *The Niagara River*, by Archer Butler Hulbert; *The Other Americans*, by Arthur Ruhl; *Andes and the Amazon*, life and travel in Peru, and *Peru*, its former and present civilization, by C. Reginald Enock; *Through Southern Mexico*, by Hans Gadow; *Guide to the West Indies and Bermuda*, by F. A. Ober; *The Cradle of the Deep* (West Indies), by Sir Frederick Treves; *New Zealand*, painted by F. and W. Wright, described by W. P. Reeves; and *The North-west Passage*, by Roald Amundsen.

LIVE STOCK EXPOSITION. See AGRICULTURE.

LLOYD-GEORGE, DAVID. A British statesman, was appointed Chancellor of the Exchequer, on the reorganization of the British ministry after the resignation of Sir Henry Campbell-Bannerman in April, 1908. He was born in Manchester in 1863 of Welsh parents and was educated in Wales. He became a solicitor in 1884, and since 1890 has represented the Caranarvon boroughs in Parliament. He soon acquired a reputation for ability and radicalism, fearlessly opposing the Boer War, and at all times championing the cause of the workingman. After the Liberal victory in 1906 he became President of the Board of Trade, and has since distinguished himself by settling the cotton strike dispute which involved 300,000 workmen, and by averting a threatened strike of all the railroad employees in the Kingdom.

LOAN AND TRUST COMPANIES. Owing to the intimate connection of the trust companies of New York City with the financial panic late in 1907, much interest was manifested in them in banking circles during the year. During the closing months of 1907 some of these companies were put to the severest tests to which financial institutions in this country have been subjected in recent years. Four companies, the Knickerbocker, Jenkins, Williamsburg and International, were forced to suspend. While some abuses were disclosed in the sequel, trust companies as a whole made a remarkable showing. The deposits of trust companies of Greater New York were decreased by \$354,696,000, or over 37 per cent., by the demands of financial stress. These demands, moreover, came at a time when the procuring of funds was extremely difficult. About the beginning of 1908, however, deposits began to increase, and continued to do so with such rapidity that on August 31st, 1908, the metropolitan companies showed deposits of \$945,393,597, or almost precisely the amount held on August 22d, 1907. The period of most rapid recovery was in the second quarter of the year, March 25th to June 17th. The total investments of these companies aggregated \$278,000,000 December 31st, 1907; on March 25th they had fallen \$5,000,000, but on June 17th they amounted to \$324,000,000, and on August 31st, to \$346,000,000. This latter sum exceeded by about one million the amount of investments in August,

1907. The loans, however, did not show similar recovery. On the dates indicated they were as follows, in millions of dollars: August, 1907, \$670; December 31st, 1907, \$417; March 25th, 1908, \$436; June 17th, \$504; August 31st, \$522.

The report of the Comptroller of the Currency showed that there were 842 loan and trust companies in the United States on June 17, 1908, with aggregate resources of \$2,865,632,000. This was an increase of 48 in their number, but a decrease of \$205,786,000 in their resources, compared with June, 1907. Practically all of this decrease was due to the condition of New York companies, which, as already shown, recovered this falling off in the months following June. The principal items of resources were as follows: Loans, \$1,380,432,000; investments in bonds and other securities, \$775,875,000, and cash on hand, \$118,398,000. The liabilities included capital stock paid in, \$278,408,000; surplus and undivided profits, \$416,039,000, and deposits, \$1,866,964,000. Compared with 1907 there was a decrease of \$221,682,000 in loans and of \$194,658,000 in deposits, while capital showed an increase of \$2,362,000, and surplus of \$17,174,000. Loan and trust companies in Pennsylvania, Rhode Island, New Jersey and Missouri, shared with New York the decrease in resources. The number of companies in New York was 88; in Pennsylvania, 327; in Indiana, 91; in New Jersey, 75; and in Massachusetts, 52. While the capital invested in trust companies in Pennsylvania exceeded that in New York, companies in the latter State had 44 per cent. of the total resources of all companies.

The favorable position of New York City trust companies during the past few years has been due to the low cash reserve against deposits required of them. This enabled them to use deposits most freely and therefore to pay unusual rates of interest on deposits, thereby further increasing deposits and ability to engage in financial operations. The close connection between this condition and the October, 1907, crisis, in which the trust companies played a leading part, led to legislative action, requiring that trust companies in New York City, Borough of Manhattan, maintain a cash reserve against deposits of 15 per cent. all in cash; those in other boroughs, 15 per cent. two-thirds in cash, and those elsewhere, 10 per cent. one-half in cash. See **BANKS AND BANKING.**

LOCOMOTIVES. While the number of locomotives built during 1908 was the smallest in ten years and was less than one-third of the record-breaking output of 7,362 in 1907, some interesting tendencies in design were apparent. For heavy and high speed passenger service the so-called Pacific type, which has a four-wheel leading truck, three pairs of driving wheels and a two-wheel trailing truck under the firebox, was the prevailing design ordered. While the maximum weight on driving axles in a few instances reached 57,000 pounds, the general practice was to limit the weight to below 55,000 pounds. Locomotive weights show a tendency to constantly increase, and the solution of the difficulties due to excessive driving wheel loads appears to be to increase the number of such wheels, and the division of the machine into two separate and articulated units with the two sets of cylinders compounded. This is known as the Mallet articulated compound type, and was first used in the United States on the mountain section of

the Baltimore & Ohio for hauling very heavy freight trains up steep grades. The Great Northern and the Erie ordered locomotives of this type in 1907. The Erie engines were the largest built up to the end of 1908; they weigh 410,000 pounds, and have a tractive effort of 94,800 pounds, which is the equivalent of three ordinary freight locomotives. During 1908 nine other railway companies placed orders for Mallet type locomotives. Two of these, which were ordered by the Central Pacific, will exceed the Erie locomotives in weight, as they are to weigh 430,000 pounds. Heretofore the articulated compound type had been used exclusively for slow heavy freight service. The Atchison, Topeka & Santa Fe, however, has ordered a number of these locomotives which will be used for hauling heavy passenger trains over the Rocky Mountains. They will have four pairs of driving wheels and a four-wheel pony truck for each half or unit.

The Walschaerts valve gear was used on a large proportion of the locomotives built in 1908, and may be said to have gained a firm foothold in American practice. It is driven by outside connections, whereas the older Stephenson link motion, which it seems destined to replace, is driven by eccentrics on the axles between the frames. Less weight and greater accessibility for repairs and adjustments are the principal advantages of the Walschaerts gear. Superheating made little progress in 1908, although a few locomotives were equipped with superheaters of both the smoke-box and fire-tube type. With the exception of the Mallet type engines already referred to, only a few compound locomotives were ordered. The additional complication of compound locomotives seemingly offsets the small gain in economy. See **RAILWAYS.**

LOUD, EUGENE F., An American politician, died in San Francisco, on December 20, 1908. He was born in Abington, Mass., in 1847, went to sea at the age of thirteen, and enlisted in the Union Army when only fifteen years old, serving through the last three years of the Civil War. After the war he settled in California, became prominent in Republican politics, and was a member of Congress from 1891 to 1903. In the House he was a recognized expert in postal matters, and for several years was chairman of the Committee on Post Office and Post Roads. He was American delegate to the Universal Postal Congress at Rome in 1906.

LOUISIANA. One of the Gulf States of the United States. Its area is 48,506 square miles, of which 3,097 square miles are water. The population of the State, according to a Federal estimate, was, in 1908, 1,592,056. The largest cities are New Orleans, with an estimated population in 1906 of 250,000; Shreveport, 32,000; and Baton Rouge, 19,000.

MINERAL RESOURCES. Petroleum is the most valuable of the mineral products of the State. The production for 1907 was 5,000,221 barrels, as against 9,077,528 barrels in 1906. The value of the petroleum produced in 1907 was \$4,063,033, as against a value of \$3,557,838 in 1906, thus the decrease in the production in 1907 over 1906 was more than equalled by the increase in value of the product. Petroleum is produced in the State in three chief fields, the Anse-la-Butte Field, Jennings Field, and the Caddo Field. A great quantity of sulphur is produced in the State. Louisiana produced clay products in 1907 valued

at \$928,570, as compared with a value of \$900,697 for the product of 1906. Other mineral products are clay products, coal products, mineral waters, natural gas, salt, sand and gravel. In the output of all these substantial gains were made in 1907. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$10,876,719, as compared with a value in 1906 of \$10,334,030.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to the United States Department of Agriculture, were as follows: Corn, 33,898,000 bushels, valued at \$23,729,000, from 1,712,000 acres; oats, 600,000 bushels, valued at \$384,000, from 30,000 acres; rice, 11,550,000 bushels, valued at \$9,009,000, from 350,000 acres; potatoes, 1,066,000 bushels, valued at \$981,000, from 13,000 acres; hay, 31,000 tons, valued at \$341,000, from 22,000 acres; tobacco, 86,700 pounds, valued at \$27,774, from 102 acres. The production of the cotton crop in 1908-9 was 472,000 bales, which was a decrease from the crop of 1907-8, which was about 712,000 bales. The decrease in the production of cotton has been marked for several years. The largest cotton crop was that of 1904-5 when 1,113,589 bales were produced. In the production of rice Louisiana occupies first place, surpassing in 1908 Texas, which previously had occupied equal rank. The production of rice increased from 8,680,000 pounds in 1907, although the acreage decreased from 310,000. The number of farm animals has remained practically constant since 1900, except for an increase of 16 per cent. in the number of mules, and a decrease of 14 per cent. in the number of swine. The estimated value of the wool clip of 1908 was \$133,052.

The reports of sugar from 15 parishes for 1908 gave the production at 444,241.80 pounds of sugar and 430,981 barrels of molasses, while 21 other parishes made 35,833 barrels of syrup. The total sugar production of the State was estimated at about 55,000,000 pounds, and 540,000 barrels of molasses; 106,000 boxes of oranges, and large quantities of vegetables, fruits, nuts, etc., were grown in the State in 1908.

MANUFACTURES. Louisiana made very great progress in the extent and value of its manufacturing from 1900 to 1905. In 1905 there was invested in industries carried on in factories \$150,810,600, there were employed 55,859 wage-earners, and the products were valued at \$186,379,592, these figures being 49.5, 36.6 and 67.3 per cent. larger than in 1900. Of the wage-earners only 4,604 were women, and only 1,313 were children under 16. The value of the products of leading industries, and, in parentheses, the per cent. of increase over 1900, were: Refining sugar and molasses, \$73,786,659 (57.8); lumber and timber products, \$35,192,374 (103.5); cotton-seed oil and cake, \$13,187,608 (87.7); cleaning and polishing rice, \$10,718,311 (86.8); bags, other than paper, \$4,076,226 (18.4); and foundry and machine-shop products, \$3,149,209 (17.8 per cent. decrease). Louisiana ranked second in both 1900 and 1905 in sugar and molasses refining, and third in cotton-seed products. About 68 per cent. of the value of lumber and timber products was contributed by yellow pine, and 26 per cent. by cypress. New Orleans was credited with products valued at \$84,604,006.

EDUCATION. The Report of the Superintendent of Education for 1907 shows a total school population in the State of 496,801. There were enrolled in public schools, 243,731, of whom 163,603 were white, and 80,128 colored. The average attendance among the white children was 116,527, and among the colored, 57,097. There were employed 967 male teachers and 3,845 female teachers; 436 colored male teachers and 732 colored female teachers. The receipts for school purposes for the year ending December 31, 1907, were \$3,856,871.09, which included a balance from the year preceding of \$563,153.24. The disbursements for school purposes were \$3,481,275.59; leaving a balance on hand December 31, 1907, of \$392,569.33. The average salary per month for white male teachers was \$74.50; for female white teachers, \$49.

FINANCE. According to the biennial report of the State Treasurer for 1906-7, the total receipts for 1907 were \$6,628,502.01, and the expenditures, \$5,209,179.58, leaving a balance in the treasury on January 1, 1908, of \$1,419,322.43. The chief revenues were from the general funds, from the current school funds, from the interest tax fund, from the free school fund, and from the penitentiary fund. The chief expenditures were on account of the general fund, current school fund, interest tax fund and penitentiary fund. The bonds of the free school fund on April 1, 1908, amounted to \$791,830. The interest-bearing bonds outstanding for the State on April 1, 1908, amounted to \$11,108,300.

POLITICS AND GOVERNMENT. The most notable political event in the State in 1908 was the passage of the Locke anti-racing law by the Legislature on June 23rd. This measure, which makes bookmaking and kindred practice either within or without a race track a misdemeanor, had the support of the Governor, but met strong opposition in both houses of the Legislature. The racing interests, which are very powerful in Louisiana, strongly opposed the measure, and they were able to secure strong support in both houses. The strongest opposition to the bill came in the Senate, where, as in the case of the bill of the same character in New York, it was passed by the vote of one Senator who had risen from a bed of sickness to cast his vote. The effect of this act is to abolish public betting on races throughout the State. An aggressive attempt was made in the Legislature to pass a measure providing for State prohibition, but this having failed, an act was passed increasing the liquor license to \$1,000, and providing other regulations. Under the local option law, twenty-eight of the fifty-nine parishes of the State were "dry" in June, 1908. A law was passed by the Legislature prohibiting the sale of liquor on trains passing through the State. A progressive child labor law passed at this session of the Legislature. This measure raises the age limit from twelve for boys to the standard of fourteen for both boys and girls in manufacturing establishments of the State. Satisfactory evidence of the age of the child is required. A ten-hour day is provided for and night work is forbidden for boys under sixteen and girls under eighteen. Provisions were made also for proper sanitation and for the protection of employees against accidents and injuries. The act went into effect immediately on its passage. Senator S. E. McEnery was elected by the Legislature to succeed

himself, as a result of the election held on April 21st.

CONVENTIONS AND ELECTIONS. The Democratic primary election was held on January 28th. It resulted in the nomination of Jared Y. Sanders, the Lieutenant-Governor of the State, for Governor. At the State election held on April 21st, Sanders was elected by a majority of over 40,000. The Legislature elected was unanimously Democratic. Four constitutional amendments were adopted, the most important being one increasing the power of the State Railroad Commission, and another prohibiting foreign railroad corporations from carrying their cases to the United States Supreme Court. Several counties of the State adopted local option. In an election held on January 14th, the city of Shreveport was carried for prohibition after an exciting contest. Two conventions were held by factions of the Republican party to elect delegates to the National Convention. The so-called "Black and Tan" Convention met at New Orleans on March 5th, and elected delegates who were uninstructed. The "Lily White" Republicans met on May 11th, and instructed the delegates selected to vote for W. H. Taft for President. The Democratic State Convention met at Baton Rouge on June 3rd, and chose delegates instructed to vote for William J. Bryan for President. In the election of November 3rd, William J. Bryan carried the State by a majority of about 54,000 (Bryan, 63,568; Taft, 8,958; Debs, 2,538). The two important State offices at issue, Supreme Court Justice and Railroad Commissioner, were won by Democrats. All seven Democratic nominees for Congress were elected. A constitutional amendment exempting mortgages from taxation was passed.

OTHER EVENTS. On April 26th a tornado caused large loss of life and great damage to property in the State. In July trouble broke out between Italians and native laborers in Tangipahoa Parish, as the result of the blowing up of the home of an Italian by a mob. Rioting followed and five hundred Italians took refuge in a swamp, where they were besieged by an armed force of natives. Troops were dispatched to the scene on July 24th by Governor Sanders, and further violence was averted. A fire in New Orleans on August 30th destroyed property valued at over \$1,000,000. A railroad collision at Littlewood, a suburb of New Orleans, on November 11th, caused the death of eleven persons and the injury of over twenty. On February 14th, 72 delegates from 13 labor organizations were indicted at New Orleans by the Federal Grand Jury for interfering with the trade of the United States with foreign countries.

LEGISLATION. Among the important measures passed at the legislative session of 1908 were the following: A law was passed providing for the establishment by the State Board of Agriculture and Immigration of a branch experimental station at some suitable point in the rice belt of the southwestern part of the State for the purpose of carrying on scientific and experimental investigations with reference to the production of rice. A measure was also passed fixing a standard for cotton classification. A child labor law was passed. (See CHILD LABOR.) An act was passed making it a misdemeanor for any person connected with a public school to act as agent for or to receive gifts or commissions, directly or indirectly, from indi-

viduals or companies that manufacture, handle, or sell in the State any kind of school-book or apparatus. Measures were passed prohibiting gambling on horseracing. A law was enacted making it a misdemeanor to circulate false statements or reports concerning the financial condition of any bank organized under the law of the State. A commission for the conservation of natural resources was established and a Chair of Forestry in the State University was founded. Several important measures were enacted relating to insurance. A bureau of labor and industrial statistics was created, with a commissioner. Measures were passed requiring that mechanics employed on all State or public buildings or public works in cities exceeding 10,000 population, shall be citizens of the State, except under certain conditions. A State live stock sanitary board was created, with power and authority to regulate live stock sanitary matters. The selling or giving away of cocaine was forbidden. Laws were passed enlarging the power of the railway commission, and other important measures relating to railroads were enacted. Measures were enacted providing for a new registration of voters throughout the State, and the primary election law was amended.

STATE OFFICERS: Governor, J. Y. Sanders; Lieutenant-Governor, P. M. Lambtemont; Secretary of State, J. T. Michel; Auditor, Paul Capdeville; Treasurer, O. B. Steele; Attorney-General, Walter Guion; Superintendent of Education, T. H. Harris—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, J. A. Breaux; Associate Justices, A. D. Land, F. T. Nichols, Frank A. Monroe, O. O. Provosty; Clerk, T. McC. Hyman—all Democrats.

The State Legislature of 1909 is composed of 41 Democrats in the Senate and 116 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES, under the section Congress.

LOWELL, ABBOTT LAWRENCE. An American educator, born in Boston on Dec. 13th, 1856, a nephew of James Russell Lowell. He graduated at Harvard in 1877, and at the Law School there in 1880, and practiced law in Boston from 1880 to 1897, when he was appointed a lecturer at Harvard. In 1900 he became professor of the science of government at Harvard, a chair he held in 1908. When the resignation of President Charles W. Eliot (q. v.) was announced, Professor Lowell was mentioned as most likely to become his successor. His scholarly publications include: *Essays on Government* (1889); *Governments and Parties in Continental Europe* (1896); *Colonial Civil Service: the Selection and Training of Colonial Officials in England, Holland and France*, with Professor H. Morse Stephens (1900); *The Influence of Party Upon Legislation in England and America* (1902); and *The Government of England* (1908). See LITERATURE.

LUCCA, PAULINE. A German soprano, died in Vienna, on February 28th, 1908. She was born in that city on April 26th, 1841, studied with Uschmann and Levy, and, because of the poverty of her parents, was obliged at first to sing in the chorus at the Vienna opera. In 1859 she made her debut at Olmütz, as Elvira, in *Ernani*, and was very cordially received. The great beauty, flexibility and range of her voice (two and a half octaves), and her cleverness and originality as an actress, attracted the attention of Meyerbeer, who was searching Europe for a

singer equal to the rôle of Selika in his *L'Africaine*, and he trained her for the part, which she presented for the first time, and with great success, at Covent Garden, London, in 1865. Meanwhile she had sung various rôles at Berlin, and had been engaged there as court singer for life. She sang the rôles of Valentine (1863), Marguerite (1864), and many others, at Covent Garden, and became popular in England as she was also on the continent. She visited the United States in 1872-74, and repeated her European successes. Mme. Lucca was in her prime when she left the stage; she taught for a time, in Vienna, but abandoned it as thankless labor.

LUCHAIRE, ANDRÉ. A French historian and educator, died on November 15th, 1908. He was born at Paris in 1846, and graduated at the École Normale in 1869. After teaching at Pau and Bordeaux he became professor of history at Bordeaux in 1877. At the time of his death he was professor of mediæval history at the Sorbonne, Paris. His works include: *Review of the Texts of the Old Gascon Dialect* (1884); *History of Monarchical Institutions in France under the First Capetians* (2 vols. 1884); *The University of Paris under Philippe-August* (1899); *Innocent III.; Rome and Italy* (1904); and *Innocent III.; the Crusades of the Albigeois* (1905).

LUÍZ PHILIPPE, Duke of Braganza, and Crown Prince of Portugal. See CARLOS I., King of Portugal.

LUMBER. See FORESTRY.

LUTHERAN CHURCH. A religious denomination which includes the largest body of Protestants in the world and is the mother church of Protestantism. The church is scattered throughout the world, but is found principally in Germany, Sweden, Norway, Denmark, Finland, Eastern Russia, part of Austria-Hungary, Roumania, France, England, Australia and North and South America. As to principle, the church holds to the "pure Word of God" and the two Sacraments of Christ. Historically, it is conservative as compared with more radical Protestant bodies. Church government is not an essential and the church flourishes under congregational, presbyterian and episcopal forms. The first Lutheran minister came to North America in 1619. There were Dutch Lutherans in Manhattan in 1623. The great organizer of the church in the United States was Henry Melchior Muhlenberg, who arrived in 1742, and is known as the Patriarch of the Lutheran Church in America. He founded the ministerium of Pennsylvania, the Mother Lutheran Synod in this country, in 1748. It was a general body. The first attempt to combine the various Lutheran synods was made in 1820 by the organization of the General Synod. About the middle of the century great numbers of Lutherans came over from Scandinavia and Germany and filled up the territories of the Northwest and the West. The General Council, which is prevailingly English, but teaches the Gospel in German, Swedish and other languages, was founded in 1867. The Synodical Conference, prevailingly German, was founded in 1871. The United Synod South was founded in 1886. The four general bodies of Lutherans embrace two-thirds of the Lutherans in the United States. The chief independent synods are the United Norwegian Synod, the Joint Synod of Ohio and the German Iowa Synod. The total number of

Lutherans in America in 1908 was 2,052,239 embraced in 67 synods. There were 8,200 ministers and 13,372 congregations. The church supports 114 educational institutions, having property valued at \$8,264,800, and \$2,549,600 in endowment. In these institutions are 975 professors and 14,991 students. Of these 1,239 are in theological seminaries. The Lutherans maintain 198 benevolent institutions, with property and endowment valued at \$7,177,059. In these institutions 68,614 persons were cared for in 1908. There were 10 mission boards, which conduct foreign missions in India, Japan, Liberia, Africa, China, Madagascar, Persia, Alaska, Cuba, Porto Rico and South America. It is estimated that there are about 76,000,000 Lutherans in the world. Statistics relating to the various divisions in the United States are as follows:

GENERAL COUNCIL, 465,212 communicants, 1,546 ministers, 2,344 congregations, 316,177 Sunday school scholars; benevolent offerings, \$502,517; value of church property, \$22,255,549. The biennial convention will meet in Minneapolis beginning September 9, 1909.

GENERAL SYNOD. Communicants, 278,596; ministers, 1,325; congregations, 1,739; Sunday school scholars, 231,413; value of church property, \$17,425,174. The biennial convention meets at Richmond, Indiana, June 2d, 1909.

SYNODICAL CONFERENCE (German): Communicants, 672,049; ministers, 2,517; congregations, 3,174; Sunday school scholars, 63,043; benevolent offerings, \$634,648. The next convention meets at Seward, Neb., 1910.

UNITED SYNOD OF THE SOUTH: Communicants, 47,177; ministers, 224; congregations, 443; benevolent offerings, \$108,028; value of church property, \$1,427,025; Sunday school scholars, 30,308. The next convention meets at Winchester, Va., September 6th, 1910.

INDEPENDENT SYNODS: Communicants, 589,205; ministers, 2,588; congregations, 5,672; Sunday school scholars, 161,754; benevolent offerings, \$718,363.

Important events in 1908 were the consecration of the Krauth Memorial Library of the Theological Seminary at Philadelphia; the unification of the Home Missions of the General Council and the organization of a new English Synod in Canada; the entrance into Japan by the General Council and into South America by the General Synod and conferences in the Northwest looking toward the close union of a large number of Norwegian Lutherans in America.

LUTHER LEAGUE OF AMERICA. A religious organization connected with the Lutheran Church, formed in Pittsburg, Pa., in 1895. Its basis is the unaltered Augsburg Confession, and it receives into its membership any society of whatever name connected with a Lutheran organization or a Lutheran institution of learning. Its membership in 1908 was over 100,000 in twenty-five States, fourteen of which have permanent organizations. Its official organ is the *Luther League Review*, published in New York City, and edited by the Chairman of the National Executive Committee and First Vice-President, E. F. Eilert. The President of the League is William C. Stoeber, and the General Secretary, Luther M. Kuhns, Omaha, Nebraska.

LUXEMBURG. An independent neutral Grand Duchy of western Europe. Area, 998 square miles; population (1905), 246,455. Lux-

emburg, the capital, had 21,024 inhabitants in 1905. The production of iron ore in 1907 was 7,492,870 metric tons, valued at 17,568,000 marks; that of pig iron, 1,484,872 tons, valued at 82,914,000 marks (1 mark = 23.8 cents). The beer production in 1907 was 260,704 hectolitres. Luxembourg is included in the German Customs Union. The length of railway in 1907 was 326 miles; of telegraph line, over 1,062 miles. A canal connecting the Chiers and Moselle rivers, 31 miles long, to connect with the German, French, and Belgian waterway systems, is in project. The Grand Duchess Marie Anne, wife of the Grand Duke Wilhelm, became regent on November 13th, 1908. As a result of the elections for half the Chamber in June, 1908, the Clericals lost two seats, the Independents lost one seat, and the Liberals gained three seats.

LYNE, JOSEPH LEYCESTER (Father Ignatius). A Church of England mission preacher, monk and superior of Llanthony Abbey, died on October 10, 1908. He was born in Trinity Square Tower on November 23, 1837, and was educated at St. Paul's School and at Trinity College, Glenalmond. He was ordained in 1860, and became curate of St. Peter's Church, Plymouth. In 1870 he founded Llanthony Abbey, and in 1890 visited the United States, preaching in New York, Boston and Newport. Both in the United States and England his services were very largely attended, but also in both countries his doctrines aroused the hostility of the higher clergy. He was not permitted to preach in the Protestant Evangelical churches in Boston, and in New York City the question as to his status in the church aroused much discussion among the clergy and resulted in his bitter denunciation of Bishop Potter. In 1898 he was ordained priest in the Llanthony Abbey Church. He attracted considerable attention in 1904 by claiming the power to perform miracles. During the last few years of his life he refused to preach in the Anglican churches, because of the attitude of the bishops toward "rationalism."

McCLELLAN, GEORGE BRINTON. Mayor of New York, was successful in the action for the recount of the ballots cast in the municipal election of 1905, the jury being instructed to find that he had been elected Mayor over William R. Hearst, by a plurality of 2,791, a gain for Hearst over the official count of 863 (June 30, 1908). He was born in Dresden, Saxony, on November 23d, 1865, the son of Gen. Geo. B. McClellan; graduated at Princeton in 1886, and became a reporter for a New York newspaper. He was admitted to the bar in 1892, was president of the New York Board of Aldermen in 1893-94, and Member of Congress from 1895 to 1903. In 1903 he received the Democratic nomination for Mayor of New York, and was elected over Seth Low, and he was reelected in 1905 over W. R. Hearst, who ran on a platform demanding municipal ownership of public utilities. A cry of fraud was raised and after more than two years of effort a recount was obtained from the courts with the result indicated above. (See New York.) Shortly after his second election McClellan broke with the Tammany Hall organization. He opposed the nomination of Hearst for Governor in 1906, and refused to support him during the campaign. He is the author of *The Oligarchy of Venice*, and in 1908 was appointed Little Lecturer at Princeton University, succeeding Grover Cleveland.

McCOSH, ANDREW J. An American surgeon, died on December 2d, 1908. He was born in Belfast, Ireland, in 1858, a son of President James McCosh, of Princeton University, graduated at that institution in 1877, and at the College of Physicians and Surgeons in New York in 1880, and studied at the University of Vienna in 1882. He began to practice in New York City in 1883, and became surgeon to the Presbyterian Hospital in 1889, after having been clinical lecturer in surgery and professor of clinical surgery at Columbia University. Dr. McCosh did not specialize in any one line, but was known as a very skillful general surgeon. At the meeting of the International Medical Congress in 1908, he read an important dissertation on peritonitis. His death was due to injuries received in a carriage accident while answering a professional call in New York on November 28th, 1908.

MacDONALD, JAMES WILSON ALEXANDER. An American sculptor, died on August 14th, 1908. He was born at Steubenville, Ohio, in 1824, was apprenticed to a blacksmith, but ran away from home in 1841. He went to St. Louis, where he engaged in the publishing business. Meanwhile, he studied sculpture under Waugh, and in 1854 executed his first commission, a bust of Senator T. H. Benton. At the close of the Civil War he moved to New York, where he soon became famous for his portrait busts and statues. The best known of these are the statue of Fitz-Greene Halleck in Central Park, New York City (1877), the statue of General Custer at West Point, and the bust of Washington Irving in Prospect Park, Brooklyn. He also executed busts and statues of Charles O'Connor, Edward Bates, Bryant, Cooper, and Washington.

MacDOWELL, EDWARD ALEXANDER. An American composer and pianist, died on January 23d, 1908. He was born of Irish-Scotch parentage at New York, on December 18th, 1861. During his early youth he received some lessons from the pianist, Teresa Carreño, who was afterward to become one of the most notable interpreters of his music. In 1876, accompanied by his mother, he went to Paris and entered the Conservatory, where he studied the piano under Marmontel and theory and composition under Savard. One of his fellow pupils was Claude Debussy (q. v.). His talent for drawing, at this time, was almost equal to his musical gifts, and one of the instructors at the École des Beaux Arts, seeing one of his sketches, offered him three years free instruction in art. MacDowell finally decided, however, to continue his musical studies. Becoming dissatisfied with conditions at Paris, he went to Stuttgart in the fall of 1878, but finding conditions there equally irksome, went to Wiesbaden, where he studied for a few months under Louis Ehlert. His mother returned to America in 1879, and Macdowell entered the Conservatory at Frankfurt, where he studied the piano under Carl Heymann, and composition under Raff. Under these two teachers—who both recognized his real genius—he made great progress. When Heymann left the Conservatory in 1881, he recommended MacDowell as his successor. Failing to receive the appointment on account of his youth—he was only 19—he went to Darmstadt as head piano teacher at the Conservatory there. He also gave private lessons. In 1882, at Raff's suggestion, he visited Liszt at Weimar, and was cordially received by the venerable composer. Through Liszt's influence, MacDowell played his

own First Modern Suite for the Piano at the 19th convention of the Allgemeiner Deutscher Musik-Verein on July 11, 1882. The suite was published the following year, and was the first of his works to appear in print. MacDowell remained at Wiesbaden, teaching and composing, until the summer of 1884, when he returned to America, where he married Miss Marion Nevins, a former pupil. They went to London the same year, and thence back to Frankfort. Soon afterwards they moved to Wiesbaden, where they lived until 1888, when they returned finally to America, settling in Boston.

At this time MacDowell, already famous abroad as a pianist and composer, was comparatively unknown in the United States. His first public appearance in America was on Nov. 19, 1888, at Chickering Hall, Boston, where he played part of his *First Modern Suite*. During the next eight years his fame grew rapidly. On Jan. 10, 1890, the Boston Symphony Orchestra played his symphonic poem *Lancelot and Elaine*; the same orchestra played *Hamlet and Ophelia* on Jan. 28, 1893. On Jan. 23, 1896, the Boston Orchestra placed his *Indian Suite* and *First Piano Concerto* on the same programme. In the spring of 1896 he became the head of the newly founded department of music at Columbia University. But the conditions of academic life and work were not to his taste; and on Jan. 18, 1904, after eight years of what he deemed almost fruitless labor, he resigned. He now resumed his private piano classes, but the strain of overwork had already begun to tell. He commenced to show signs of nervous breakdown in 1905; his mind gradually failed. He died in New York City, in his 47th year.

His published works number sixty-two, comprising nearly three hundred separate pieces. The best of these are: Op. 10, *First Modern Suite* for piano (1883); Op. 14, *Second Modern Suite* (1883); Op. 15, *First Concerto*, in A-minor (1885); Op. 23, *Second Concerto*, in D-minor (1890); Op. 30, *Two Fragments from the Song of Roland* (symphonic poem for orchestra, 1891); Op. 41, *First Suite* for orchestra (1891-93); Op. 45, *Sonata Tragica* for piano (1893); Op. 48, *Second (Indian) Suite* for orchestra (1897); Op. 50, *Second Sonata (Erica)* for piano (1895); Op. 51, *Woodland Sketches* for piano (1896); Op. 55, *Sea Pieces* for piano (1898); Op. 56, *Four Songs* (1898); Op. 59, *Fourth Sonata (Keltic)* for piano (1901); and Op. 62, *New England Idyls* for piano (1902). Consult: Hughes, *Contemporary American Composers* (1900); and Gilman, *Edward MacDowell* (1909).

MACEDONIA. SITUATION AT THE BEGINNING OF 1908. Macedonia, which lies chiefly in the three vilayets or provinces of Kossowo, Monastir and Salonika, has no separate official entity, but forms a part of the Turkish Empire, to which it was assigned by the Treaty of Berlin (1878). The anarchy which has prevailed for several years past continued during the first half of 1908, showing itself at intervals in massacres, assassinations and pillage. In 1907 it had culminated in the murder of Boris Sarafoff, the leader of the so-called Macedonian Committee of Freedom. During that year it was estimated by Sir Edward Grey that under the ineffective reform administration the murders had averaged some 200 a month. The reform scheme had been formulated by the Mürz-

steg programme of 1903, agreed upon by Austria and Russia. In 1897 the Austrian Emperor had visited St. Petersburg, and on April 29th in that year the Austrian and Russian foreign ministers issued a joint note to the Balkan States, saying that the two Powers would act together for the maintenance of peace and the *status quo*. At the end of 1897 Count Goluchowski explained this agreement as meaning that Austrian and Russian interests in the Balkans were harmonious and that each repudiated all thought of conquest or of securing preponderant influence. Pursuant to this policy of concerted action in the Balkans, the two Powers agreed on the reform programme of Mürzsteg, which demanded a system of foreign control including civil agents and a special force of gendarmes under foreign officers to put the reforms into execution. The disorders continued, however, and in 1905 conditions were so bad that the English Balkan Committee, headed by Lord Lansdowne, arranged with Austria and Russia for a new scheme providing for international financial control. No improvement, however, seemed to result from these measures, and early in 1908 the British Foreign Minister, Sir Edward Grey, offered additional proposals for reform. The chance of an effective coöperation between the powers in Macedonia, however, was endangered by the action of Austria in the matter of the Novi-Bazar Railway.

THE AUSTRIAN RAILWAY PROJECT. On Jan. 27, 1908, Baron von Aehrenthal, the Austro-Hungarian Minister for Foreign Affairs, announced that his government had been authorized by the Porte to complete a railway across the Sanjak of Novi-Bazar, from Sarajevo in Bosnia to Mitrovitza, which would connect Salonika directly with Vienna; and that the Porte had been requested to authorize the preliminary work on the line from Mitrovitza to Uvatz. For two or three weeks after this announcement, the Russian press attacked the project, and a Russian counter-project was proposed for a Russian-built line uniting the Danube with the Adriatic and crossing Serbia and Bulgaria. The Austrian government declared that it would offer no objection to such a line. In treating separately with the Porte in this matter, Austria had disregarded the Austro-Russian agreement of 1897, and Baron von Aehrenthal declared at the session of the Austrian Herrenhaus that this agreement was at an end. His action was regarded as a proof of a new Austrian policy in the Balkans, looking to national expansion. It was thought to have a serious bearing on any possible settlement of the Macedonian question, for having these separate interests with Turkey, Austria was not likely to insist on measures of reform which were offensive to the Porte. To be sure, the new line was in the region in which Austria was authorized by the Treaty of Berlin to maintain garrisons and establish military and commercial roads. Technically there was no denying her right. But the press complained bitterly of her course as endangering coöperation in the Balkans, and especially as enhancing the difficulty of the reform administration in Macedonia. Von Aehrenthal's defense was that the Austrian policy kept economic questions distinct from political, and that this was purely an economic affair, the railway having no other purpose than the promotion of the commercial interests of the lands

through which it passed. To this critics replied that already injurious political effects were manifest and that the road moreover was of great military importance, providing an all-German route from Vienna to Salonika, and offering the means of military concentration and occupation.

FURTHER REFORM PROPOSALS. Meanwhile attempts had been made by the Powers to improve the Macedonian situation. On Dec. 22d, 1907, they presented a joint note to the Porte for the renewal of the mandates of the reform officials in Macedonia for seven years. To this the Porte replied in Jan. 1908, that this could be granted only on condition that the officials entered the Turkish service, but in March the Porte agreed to the renewal of the mandates and accepted Italy's nomination of General Count di Robilant as Commander of the gendarmerie, to succeed General de Georgia. Early in the year there was an important discussion of the Balkan question in the British House of Commons, and Sir Edward Grey answered the criticism that had been brought against him on the score of inaction in the Macedonian difficulties. He said that the government had done everything possible, but that isolated action was out of the question and would have been unprofitable to the Macedonian Christians and led to European complications. He defined the attitude of the British government toward the Austrian railway scheme as one of "benevolent neutrality." He recognized the commercial advantages of the railway but deplored its effect in rousing apprehensions and in seeming to endanger the cause of Macedonian reform. Sir Edward Grey's new scheme of reform comprised the appointment of a Governor General by the Sultan with the consent of the Powers; all Macedonian officials to be subject to him. It was announced in March that the British reform scheme was not acceptable to the other Powers, and that Russia was at work on an alternative proposal. In July the joint Anglo-Russian proposal containing the Russian modifications of Sir Edward Grey's scheme but keeping its essential features was announced in the press as follows: "The organization of flying columns to suppress the rival bands; the appointment by the Powers of a Governor General for seven years with extensive powers including the selection of subordinates and the primary preparation of the Macedonian budget for local needs." While this question of further reforms was pending between the Powers, the triumph of the Turkish revolution and the publication of the Sultan's decree restoring the constitution solved, for the time being at least, the problems upon which the governments were at work.

CONDITION OF THE COUNTRY. Down to this time murders and other crimes of violence had occurred at short intervals. Early in May, Kamilakis, the leader of the Greek band involved in the outrage at Dragosh of Dec. 28th, 1907, was condemned to death. On May 27th, a Servian band attacked a Bulgarian village, burning their houses and killing several persons. On May 27th, fifteen Bulgarians were massacred by a Greek band at the gates of Salonika. On June 6th, the Bulgarians murdered a priest in a Greek monastery, a Greek woman and two children. There were further atrocities on June 15th and 17th on the part of the Greeks and Bulgarians, who attacked villages, burned houses

and killed numbers of inhabitants. In July matters seemed to be growing worse; the Greek and Servian bands having apparently joined against the Bulgarians gave signs of renewed activity; political crimes were on the increase, and assassinations frequent, the Bulgarian assassinations being especially numerous. Such was the condition of the country when the news of the Sultan's decree restoring the constitution reached Macedonia. Its effect was almost immediate. Quiet was restored and a number of the hostile bands surrendered. The problem of adjustment under the new régime, however, was difficult. It was complicated by rivalries among the Bulgarians and the difficulty of forming an agreement with the Young Turks. A centralized system was opposed by the Bulgarians, who feared a parliament in which the majority of the Christian element would be non-Bulgarian and in which the majority of the entire parliament would be ignorant of the needs of Macedonia. Though the Bulgarians are the largest element in the Macedonian population, they are greatly exceeded in number in the empire by the Greeks, whose Turkish population is much larger than that of the Hellenic kingdom. A Committee of Conciliations consisting of twenty-one members was appointed to consider the questions at issue between Bulgarians and Young Turks. The Bulgarians desired the retention of the foreign financial commission which was formed in 1905 through the efforts of Lord Lansdowne, and which drafts the budget and superintends the tax collections. The presence of this commission and in fact the need of foreign control in Macedonia had been humiliating to the Young Turks and was cited as one of the causes of the revolutionary movement. However, they had latterly shown themselves more friendly toward the foreign agents. In August preparations began for the new elections. See TURKEY.

MCGILLICUDDY, DANIEL F. A Roman Catholic clergyman and the first American known to have penetrated Tibet, died on July 30, 1908. He was born at Worcester, Mass., about 1860, attended Holy Cross College and the Grand Seminary at Montreal, and was ordained a priest in 1884. In 1895 he became rector of St. Stephen's Church, Worcester, which charge he held until his death. He was a strong temperance advocate, being at one time president of the Catholic Total Abstinence Union, and was also an ex-president of the Springfield Diocesan Union. During his life, he travelled extensively, visiting especially those countries and regions which were little known. His last exploration was in 1906, when he visited Tibet with a party of British Army officers. They were permitted, however, to go only as far as Gyamtse.

MCGILL UNIVERSITY, Montreal, Canada. An institution of higher learning founded in 1821. The attendance in 1907-8 was 1481. In the autumn of 1908 it was 1769, divided as follows: Arts, 501; applied science, 589; medicine, 331; law, 41; graduate school, 39; McDonald College, where instruction is given in teacher training, household science, and agriculture, 268. Of the whole number of students, 396 were women. There were 274 officers of instruction. The income for 1907-8 was \$575,000; the endowment, \$5,602,238, and the value of the grounds, buildings, and equipment about \$6.

530,000. During the summer of 1908 a new engineering building was completed at a cost of \$500,000, and good progress was made with the new medical building, which is to cost about \$600,000, and which is, in part, to be ready for use at the beginning of the session of 1909-10. The library contains 140,000 volumes. The university has graduated 5353 persons, of whom 4430 are living. The Principal is W. Peterson.

MACHINE GUNS. See MILITARY PROGRESS.

MACK, NORMAN EDWARD. Chairman of the Democratic National Committee during the presidential campaign of 1908, was born at West Williams, Ontario, on July 24, 1855. In 1879 he founded the Buffalo *Sunday Times* on a small capital and made it a success. A few years later he founded the *Evening Times*, which he made a power in Western New York. He was always a Democrat, and in 1896 his paper was one of the few dailies in New York State to support Bryan. He was elected a member of the Democratic National Committee in that year, and re-elected in 1900, 1904, and 1908. He has been identified with the Bryan wing of the party, and in 1908 was selected by Mr. Bryan to manage his campaign. See PRESIDENTIAL CAMPAIGN.

MACKAY, DONALD SAGE. An American clergyman, died on Aug. 27, 1908. He was born at Glasgow, Scotland, on November 20, 1863, and graduated at the Glasgow University in 1885 and at New College, Edinburgh, in 1889. In 1890 he came to the United States and entered the Congregational ministry. He was pastor of the First Congregational Church at St. Albans, Vt., from 1890 to 1894, and of the North Reformed Church at Newark, N. J., from 1894 to 1899. Since 1899 he had been pastor of the Collegiate Church of Saint Nicholas, New York City. He was charged with heresy by the Iowa Classis in 1905 because of an article he had contributed for the *Christian Intelligencer*. This article enumerated some of the causes which, in Dr. Mackay's opinion, accounted for the apparent increasing skepticism regarding the belief in a personal God. In this connection Dr. Mackay made special reference to the attending results of the recent legal controversy between the two factions of the Free Church of Scotland. In 1906 Dr. Mackay was elected president of the General Synod of the Reformed Church in America. He received the degree of D.D. from Rutgers College in 1905 and that of LL.D. from Hope College, Mich., in 1906. He was the author of *Collegiate Sermons* (1906).

M'KENNA, REGINALD. A British statesman, was appointed First Lord of the Admiralty in the British Cabinet in succession to Lord Tweedmouth on the reorganization of the Cabinet in April, 1908. He was born in London on July 6, 1863, and after graduating at Trinity Hall, Cambridge, was admitted to the bar in 1887. Since 1895 he had represented North Monmouthshire in the House of Commons. See GREAT BRITAIN.

MADAGASCAR. An island in the Indian Ocean, off the southeast coast of Africa, a French colony since 1896. The area, including the few adjacent islands, is estimated at 228,000 square miles. The population in 1906 numbered 2,706,661, including 7606 French, 2088 other Europeans, 3602 Asiatics, 1978 Africans, and 2,690,381 Malagasy (1,301,716 male and 1,388,665 female). The most numerous Ma-

lagasy peoples are the Hova, 847,480; the Betsileo, 408,024; the Betsimisaraka, 288,159; the Tanala, 156,720; the Sakalava, 155,126; and the Bara, 140,450. Antananarivo, the capital, had 69,767 native and 2002 European inhabitants in 1906; Tamatave, on the east coast, the principal port, 7026; Majunga, the chief port on the northwest coast, 7910. There are about 450,000 Protestants and 50,000 Roman Catholics. In 1906 there were 590 schools, with 1305 teachers and 48,804 pupils.

PRODUCTION. From 1896 to 1905 the government made 2653 concessions of land, aggregating 493,436 hectares (1 hectare = 2.47 acres). The area under cultivation in 1906 embraced 751,687 hectares, of which 28,233 were owned by Europeans. The agricultural products include rice, manioc, sugar, coffee, cotton, cacao, vanilla, tobacco, cloves, sweet potatoes, rubber, etc. Owing to the increased production of rice, its importation has almost entirely ceased; in 1907 the exports of rice amounted to 2204 tons, and its imports, 75 tons. The export of india rubber decreased from 7,538,000 francs in value in 1906 to 5,243,000 francs in 1907—due principally to the fall in the price of rubber, but partly also to the imposition of an export duty of 4 cents on the pound. In the northern provinces plantations of from 700,000 to 800,000 trees have been almost entirely abandoned, owing partly to the above-mentioned causes, and partly also to the difficulty of obtaining labor in consequence of the more remunerative employment offered to the natives in the recently formed mining camps. The yield of vanilla and coffee in 1908 was reported exceptionally good. Silk culture is encouraged. In 1906 there were ginned 158,993 pounds of cotton. There are 2,860,000 cattle, 264,000 sheep, 63,000 goats, 479,000 pigs, and a few horses, asses, and mules. The forests yield many valuable woods, rubber, gums, resins, medicinal plants, and trees furnishing material for textile, tanning, and dyeing purposes. The minerals include gold, silver, copper, lead, zinc, antimony, iron, manganese, nickel, sulphur, graphite, and lignite. Valuable stones are among the exports. The gold production in 1906 was 2,255,108 grams. In 1908 auriferous soil of a very promising kind was discovered near Tamatave, a district hitherto neglected by prospectors. In a few weeks there were extracted several kilograms of gold, including one nugget weighing nearly 500 grams. In the Antsirabo district, long known for its gold deposits, primitive methods of working are still in vogue. Coal and petroleum were also reported to have been discovered in 1908.

COMMERCE AND COMMUNICATIONS. The imports in 1907 amounted to 25,129,611 francs, of which 20,659,763 francs was from France and 778,930 from French colonies; the exports, 27,863,427 francs, of which 18,891,392 francs was to France, and 874,404 to French colonies. The principal imports are textiles, over one-half the total, beverages, metal goods, and coal; the principal exports are gold, rubber, hides, raffia, cattle, wax, and straw hats. There are few roads and there is little wheeled traffic. A highway of 217 miles is being constructed from Antananarivo to the large lake of Alaotra, in the north-central section of the island, which serves as a natural source of irrigation for extensive rice fields. A survey has been made for a highway of about 200 miles from Tamatave into the district of Ambatondrazaka, in

the north centre, a rich agricultural, timber, and rubber district. A railway is being constructed from Tamatave to Antananarivo, 168 miles, of which 121 miles were completed in 1908; government automobiles for mail and passengers were running on the uncompleted portion of the road. A canal of 22 miles between Vatomandry and Marosika, on the east coast, was completed in 1908 by joining a number of lagoons. There are over 3620 miles of telegraph line. A postal service extends throughout the island. A cable connects with Mozambique.

GOVERNMENT, ETC. The administration is in the hands of a Governor-General, assisted by a consultative council. Civil administration prevails in 19 provinces or districts, military administration in 5 districts or territories. The different races enjoy local autonomy. The army of occupation numbers about 13,000, two-thirds natives, its cost being borne by the French budget. The police and militia are maintained by the colony. For 1907 the budget balanced at 30,033,000 francs. The revenue is derived mainly from a personal tax, taxes on land and houses, customs, and public lands. Its debt in that year stood at 101,390,000 francs. In the budget of 1908 the sum of 6,000,000 francs has been assigned to expenditure on public works, including 38 schoolhouses, municipal waterworks, wharves and quays, the dredging of rivers, etc. The expenditure of France on Madagascar in 1908 was fixed at 18,586,675 francs, the whole of it for military purposes. Madagascar is not represented in the French Chamber.

MAIGNAN, ALBERT. A French decorative and historical painter, died on Sept. 29, 1908. He was born in Beaumont, France, on Dec. 15, 1844, and received his artistic education from Noël and Luminais. He was awarded a medal of the first class at the Salon of 1879, and was decorated with the cross of the Legion of Honor in 1883. His "Pope Boniface VIII. at Agani" is in the Metropolitan Museum of Art, New York City. The latter part of his career was devoted almost entirely to mural and decorative painting. His best works of this class are the decorations in the railway terminus at Lyons, and upon the walls and ceiling of the Opéra Comique at Paris. At the time of his death he was engaged upon the cartons for a set of eight Gobelin tapestries to be hung in the Senate Chamber, in Paris.

MAINE. One of the North Atlantic States of the United States. Its area is 33,040 square miles. Its population in 1908, according to a Federal estimate, was 721,170. The largest cities are Portland, with an estimated population in 1905 of 58,000; Bangor, 26,000; Lewiston, 24,365, and Biddeford, 18,000. The capital is Augusta.

MINERAL PRODUCTION. In the output of stone of various sorts Maine ranks high among the States. In 1907 stone products were quarried to the value of \$2,147,770, as against a value of the same products in 1906 of \$2,562,021. Of the stone quarried, granite was the chief, the value of this being \$2,146,420 in 1907. In the production of granite Maine ranks second among the States, being surpassed only by Massachusetts. In the production of slate Maine is also conspicuous, ranking after Pennsylvania and Vermont. The production in 1907 was valued at \$236,606, as against a value in 1906 of \$233,-

681. Maine has long been conspicuous among the other States in the production and sale of mineral waters. There were produced in 1907 1,161,832 gallons, valued at \$414,300. There was produced in the State in 1907 lime amounting to 159,494 short tons, valued at \$747,947, as compared with 222,208 short tons, valued at \$1,066,275, in 1906. Other important mineral products are clay products, feldspar, and small quantities of copper, precious stones, sand, and gravel. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1906 was \$4,379,073, as compared with a value in 1906 of \$5,227,000.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to the United States Department of Agriculture, were as follows: Corn, 567,000 bushels, valued at \$476,000, from 14,000 acres; spring wheat, 188,000 bushels, valued at \$196,000, from 8,000 acres; oats, 4,046,000 bushels, valued at \$4,224,000, from 119,000 acres; barley, 224,000 bushels, valued at \$121,000, from 8,000 acres; buckwheat, 690,000 bushels, valued at \$518,000, from 23,000 acres; potatoes, 26,100,000 bushels, valued at \$15,921,000, from 116,000 acres; hay, 1,260,000 tons, valued at \$17,640,000, from 1,400,000 acres. The State occupied in 1908 the second place in the production of potatoes, being surpassed only by New York. It is notable that the 26,100,000 bushels of potatoes produced in Maine were grown on 116,000 acres, while the 24,850,000 bushels produced in New York were grown on 425,000 acres. The acreage devoted to hay is greatly in excess of that devoted to all other farm products. The production of potatoes increased from 17,110,000 bushels in 1907, while the production of hay decreased from 2,100,000 tons. The numbers in thousands of farm animals in 1909 were as follows: Horses, 117,000; dairy cows, 179,000; other cattle, 145,000; sheep, 262,000; swine, 66,000. All classes show an increase over the numbers in 1900, the greatest being a 10 per cent. gain in the number of horses. The estimated value of the wool clip in 1908 was \$319,920.

MANUFACTURES. The census of 1905 reported 3145 establishments classed as factories, with \$143,707,750 capital, 74,958 wage-earners, and products valued at \$144,020,197, these figures exceeding those of 1900 by 9.3, 26.1, 7.2, and 27.5 per cent., respectively. Of the wage-earners, 16,825 were women, and only 1471 children under 16. The values for the leading industries, with the per cent. of increase over 1900, in parentheses, were: Paper and wood pulp, \$22,951,124 (73.6); lumber and timber products, \$17,937,683 (50.3); cotton goods, \$15,405,823 (5.3); woollen goods, \$13,989,600 (20.1); boots and shoes, \$12,351,203 (.4); foundry and machine shop products, \$4,767,025 (44.5); flour and grist mill products, \$3,932,882 (12.5); worsted goods, \$3,609,990 (102.9); wooden shipbuilding, \$3,272,331 (21.9). Other mentionable industries are the tanning and finishing of leather, marble and stone work, planing mill products, canning and preserving vegetables, and the manufacture of wooden packing boxes. Portland was credited with products valued at \$9,132,801, Lewiston with \$8,527,649, Biddeford with \$6,948,122, and Auburn with \$6,407,157.

FISHERIES. The total value of the fish taken in 1908 was \$4,291,743, from a yield of 266,517,649 pounds. The lobster catch was 17,397,342 pounds, valued at \$1,888,468. Next in point of production and value was groundfish, of which 46,094,226 pounds were taken, valued at \$916,377. The herring catch was 61,553,900 pounds, valued at \$540,896. There were 36,330,005 pounds of clams, valued at \$602,196. The salmon catch was 40,881 pounds, valued at \$8,643. Among other fish taken in large quantities were shad, scallops, smelts, sword-fish, hake, and tomcod. There were 11,706 men employed in the fisheries during the year, and the value of the plants, boats, yield, etc., was \$3,628,000.

EDUCATION. There has been a rapid extension of expert supervision among the smaller towns of the State. This extension has been going on under the terms of a very favorable law which provides that the State shall pay two-thirds of a superintendent's salary in a union of towns to the limit of \$800 on the part of the State. There are now 42 supervisory unions, including 108 towns. These, with the cities, place nearly 50 per cent. of the school population under expert supervision. Considerable progress has been made in the standardization of secondary school courses. For the year ending June 30, 1908, the total school population (ages 5 to 21) was 210,817, and the total enrollment was 132,533. The average length of the school year was 25 weeks 4 days. The average monthly salary of male teachers was \$39.34 and the average weekly salary of women teachers was \$7.67. Through a recent enactment of the Legislature the income from the State funds to the schools will be increased Jan. 1, 1909, by about \$200,000. This makes the total from State sources for all educational purposes nearly a million and a quarter. From both State and local sources the amount available will be approximately \$2,400,000. The total enrollment at the State Normal Schools at Farmington, Gorham, Castine, and Presque Isle was 1005.

FINANCE. The report of the treasurer for the year ending Dec. 31, 1907, showed a balance in the treasury on Jan. 1, 1907, of \$597,971.02. The receipts for the year were \$3,306,733.24 and the expenditures were \$3,425,236.80, leaving balance on hand Jan. 1, 1908, of \$479,467.46. The total indebtedness of the State outstanding on Jan. 1, 1908, was \$713,000. The chief receipts were from the new corporations, from the State taxes, a tax on railroad companies and taxes on savings banks. The chief expenditures were for schools, for the support of the State charitable and correctional institutions and for the public debt. The estimated receipts for the year 1908 were \$2,833,033 and the estimated expenditures \$2,814,915.23.

CHARITABLE INSTITUTIONS. In 1905 the government transferred the Arsenal property, near Augusta, to the State of Maine, to be used for asylums for the insane. A building for the criminal insane was approaching completion on this site in the latter part of 1908. Widow's Island in Penobscot Bay was also transferred to the State by the government in 1905. A site was purchased in Cumberland County for a school for the feeble-minded in 1908.

POLITICS AND GOVERNMENT. There was no meeting of the State Legislature in 1908. The State lost two of its representatives in Congress in 1908, one by resignation and one by death. Charles E. Littlefield resigned on Mar. 22, and

engaged in the practice of law in New York city. Mr. Littlefield was first elected to the 56th Congress in 1899 to fill a vacancy caused by the death of Nelson Dingley, and he was repeatedly reelected. He was considered one of the strongest members of the House. Llewellyn Powers, who was elected in 1901 to fill the vacancy caused by the death of Charles A. Boutelle, and was reelected to the 58th and 59th Congresses died on July 28. The vacancies were filled in the State election held on Sept. 14. (See below.) Frank E. Guernsey was elected to succeed Mr. Powers, and John P. Swasey to succeed Mr. Littlefield.

CONVENTIONS AND ELECTIONS. The Republican State Convention met on April 30, to select delegates to the National Convention. The delegates chosen were uninstructed, but "a resolution of preference" for William H. Taft was adopted. The Democratic District Conventions chose 12 delegates uninstructed and unpledged, but favorable, with one exception, to William J. Bryan for president. On June 30, Bert M. Fernald of Poland was nominated for governor by the Republicans, and on July 15, Obadiah Gardner received the Democratic nomination. The State campaign was a spirited one from the local issues involved. Mr. Fernald declared himself in favor of the strict enforcement of the prohibition law, and opposed to the resubmission of the question to the people. Mr. Gardner was in favor of resubmission, which is a tenet of the Democratic party of the State. The September elections in Maine are always anticipated with unusual interest in Presidential election years, as furnishing a possible indication of the trend in the rest of the country. In 1908 the State proved a poor prophet, for the Republican majority on Sept. 14 was only 8,000, as compared with a majority of about 20,000 in 1904. The falling off was due entirely to local causes. The entire Republican ticket was elected. A curious feature of the election returns was that while, in 1906, the cities of the State cast their votes against the prohibition law, in 1908 this condition was reversed. This was probably accounted for by the fact that Mr. Gardner was a former Master of the State Grange, and has strong supporters in the country districts. In the election of Nov. 3, William H. Taft received a majority of 31,240 votes over William J. Bryan (Taft, 67,120; Bryan, 35,880; Chafin, 1,487; Debs, 1,758).

OTHER EVENTS. On Jan. 24 a fire in the wholesale business district of Portland destroyed the City Hall, valuable records, the Greenleaf Library and other property valued at \$625,000. On Jan. 27, the city was again visited by fire which did much additional damage. Biddeford and Saco also suffered severely from fire during the year. On Sept. 14, fire in lumber yards in these cities caused a loss of over \$300,000. In September and October great damage was caused in several sections of the State by forest fires. A fire on Dec. 4 destroyed the piers of the Grand Trunk Railway, Portland, and the cargoes of several steamships, causing a loss of about \$600,000.

STATE OFFICERS: Governor, Bert M. Fernald; Secretary of State, A. I. Brown; Treasurer, P. P. Gilmore; Adjutant-General, A. B. Farnham; Attorney-General, H. E. Hamlin; Superintendent of Education, Payson Smith; Insurance Commissioner, S. W. Carr, all Republicans.

JUDICIARY. Supreme Judicial Court: Chief Justice, L. A. Emery; Associate Justices, L. C. Cornish, Albert M. Spear, W. P. Whitehouse, G. E. Bird, Albert R. Savage, A. W. King and Henry C. Peabody—all Republicans except Bird; Clerks, E. F. Thompson, C. W. Jones, C. F. Ewert, Republicans.

The State Legislature of 1909 is composed of 23 Republicans and 8 Democrats in the Senate, 100 Republicans and 51 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES under the section Congress.

MALARIA. Doubt was cast upon the value of quinine as a prophylactic in malaria by E. R. Stitt, surgeon in the U. S. Navy. He quotes Celli's figures as to the relative merits of quinine and mosquito protection as prophylactics. Celli says that when both quinine and protection were used 1.75 per cent. of those exposed to infection developed malaria. Under mosquito protection alone 2.5 per cent. were infected; under quinine prophylaxis alone 20 per cent. were attacked; and under no protection at all 33 per cent. developed the disease, showing only a difference of 13 per cent. between absolute disregard of preventive measures and quinine prophylaxis. Stitt gives the case of a battalion of marines who were stationed on the Isthmus of Panama for one month. During this period 9 grains of quinine were given each man daily as a prophylactic. On the trip home 215 of the 298 men developed acute malarial paroxysms, many of the cases being very severe. The resumption of quinine, which had been temporarily stopped, had little effect in checking the outbreak. This is opposed to the general experience that malaria responds readily and promptly to quinine. The writer deduces that the malarial parasites develop a resistance to the drug, and says that he has seen active motile *amæba* in the stools of patients undergoing quinine irrigations of the colon. This theory finds support in the recent work done in Ehrlich's laboratories, where it was discovered that when mice infected with trypanosomes were not given sufficient doses to destroy the organisms those protozoa developed a resistance to the drug given, and, moreover, that this resistance was retained through numberless generations. After passing through 144 mice in a period of fourteen months, these trypanosomes still retained their immunity to the exciting drug. Browning, who conducted these researches, experimented with atoxyl, parafuchsin, and trypan blue. Woldert, in endeavoring to explain why malaria breaks out in the absence of mosquitoes and in seasons when this insect is inactive, says that the malarial parasite may lie dormant in the blood for many months (during which time individuals may change their abode), without producing symptoms. To this circumstance he adds observations on the life of mosquitoes. These insects may live in the temperate zone through the winter months. Specimens have been kept alive for months. The author found larvæ of anopheles living on the surface of water in Texas after freezing weather. Mosquitoes have been found within 500 miles of the North Pole. Mircoli believes that the fever of malaria is a result of the destruction of the red corpuscles of the blood by the malarial parasite, rather than any specific action or influence of the parasites themselves. The febrile attack may occur when there is not one *amæba* in the blood, and it can be produced at

will by chilling the body, or by trauma. His experiments showed that the destroyed red corpuscle acts like a severe poison when reinjected into the animal, inducing not only fever, but trophic and dynamic disturbances.

MALET, EDWARD BALDWIN. A British diplomat, died on June 29, 1908. He was born at The Hague, where his father, Sir Alexander Malet, was Minister in 1837, and entered the diplomatic service in 1854, being attached to the British legations at Brussels, Rio de Janeiro, Washington, Lisbon, Constantinople, Paris, and Peking, at different times from that year until 1873. He was chargé d'affaires at Athens in 1873-75, secretary to the embassy at Rome from 1875 to 1878, plenipotentiary to Constantinople in 1878-79, and in the latter year was appointed consul-general and minister plenipotentiary in Egypt, serving during the time of the Arabi rebellion. He was appointed ambassador to Germany in 1884, and retained this position until his retirement in 1895. In 1900 he became a member of The Hague Court of Arbitration.

MALTA. An island in the Mediterranean, a British possession. Area, 91.6 square miles; including Gozo, Comino, and other islets, 117 square miles. Total population (1908), 209,974, exclusive of the military. Valetta, the capital and chief British naval and coaling station in the Mediterranean, has about 50,000 inhabitants. About 41,000 acres were in cultivation in 1907-8. The principal products are wheat, cummin, and cotton; in 1907-8 the production of lint only was 221,523 pounds. Of live stock there were in 1906-7 10,876 horses, asses, and mules; 6022 cattle, 19,901 sheep, and 19,231 goats. The imports and exports in 1907-8 amounted to £1,236,530 and £159,436 respectively, besides the transit trade, amounting to £5,747,059 and £5,754,102 respectively. The port of Valetta was entered in 1907-8 by 2354 vessels of 3,792,495 tons. There were 8 miles of railway and 65 miles of telegraph. The British garrison in 1908-9 numbered 7639. The revenue and expenditure in 1907-8 were £438,348 and £454,669 respectively. The Governor in 1908 was Lieut.-Gen. Henry Fane Grant.

MANCHURIA. A dependency of the Chinese empire. Area, about 363,000 square miles; population, estimated at from 5,500,000 to 16,000,000. The principal cities, with their estimated populations, are: Tsitsihar, 30,000; Changchun, 80,000 (2000 Japanese); Mukden, 150,000 (3000 Japanese); Newchwang, 50,000; Yingtse, 60,000 (6000 Japanese); Antung, 21,000 (5000 Japanese); Fengwangcheng, 18,000 (200 Japanese); Takushan, 8000; Tatungkow, 6000. The number of Japanese in South Manchuria in 1908 was 55,466. For details respecting the leased Liao-tung peninsula, see KWANTUNG.

EDUCATION. In the southern province of Shengking, or Fengtien, there have been established over 1450 primary and middle schools, partly by the government and partly by the people. Towards the end of 1908 it was reported that Viceroy Hsu, of this province, was raising a fund for the establishment of an agricultural school and had memorialized the imperial government for the establishment of fishery schools.

PRODUCTION. In the north are deposits of gold, both quartz and placer, silver, copper, lead, iron, coal, asbestos, and soda. Some mines are

worked by Chinese officials, but mostly by native companies and small capitalists. The iron deposits some 50 miles to the north of Mukden are worked to meet local requirements. Gold is obtained in alluvial deposits on the Amur and Sungari rivers. In the south of the northern province of Heilungkiang large quantities of soda are obtained and exported in cakes to southern Manchuria and other northern parts of China, where it is extensively used in dyeing establishments and in connection with silk reeling. Yentai, Fuchow, Pensih, and Fushun are the four coal regions of southern Manchuria, the Fushun deposits being the richest. The clays include brick clay, cement clay, fusible clay for cloth rolling, pure white porcelain clay, and fire clay. Granite is quarried for local use, and jadeite is exported. The value of the annual export of timber from southeastern Manchuria is between \$2,500,000 and \$3,500,000. In accordance with the agreement of May 16, 1908, the Chinese and Japanese governments have organized the Yalu Timber Company, with a capital of about \$1,500,000, in which the two governments hold equal shares; it commenced operations at Antung on Sept. 25, 1908. After the lapse of one year private merchants will be requested to undertake the business. The wheat crop of Manchuria in 1907 was estimated at 8,000,000 bushels, and in 1908 at 20,000,000. Southern Manchuria is the great granary for North China, while northern Manchuria is as yet mostly forest and steppe. But Chinese colonization is transforming the country. Large flour mills have been erected by the Russians at Harbin and other places in northern Manchuria. A small flour mill was established in 1908 by the Manchurian Milling Company, a Japanese concern, which intends to establish a chain of mills along the South Manchurian railway. Southern Manchuria also produces large crops of millet and beans. About \$1,500,000 to \$2,500,000 worth of beans and bean cake is exported annually, the former to China, the latter to Japan. The annual production of wild silk (tussah) is valued at between \$2,000,000 and \$3,000,000. It is exported in the form of cocoons, waste, thread, and cloth. In 1907 the weight of cocoons shipped from Antung was over 10,667,000 pounds, about one-ninth to Japan and the bulk to China.

COMMERCE AND COMMUNICATIONS. In the course of 1907 progress was made in the settlement of commercial affairs. Antung was opened in March, 1907, with Tatungkow as a subsidiary port. In July, 1907, an office of the Chinese Maritime Customs was opened at Dairen (Dalny), and the advantage which, as a free port, Dairen had possessed over Newchwang, was thus ended. The railway rates from Dairen and Newchwang to Kwanchengtse were equalized, thus removing another advantage which the former had possessed over the latter. The opening of Harbin early in 1907 has put an end to untaxed competition by way of Vladivostok and the Russian frontier. For the imports and exports of Newchwang, Antung, and Dairen in 1907, see under CHINA, *Commerce*.

Northern Manchuria—the Russian sphere of influence—is crossed by the eastern section of the Trans-Siberian railway, 960 miles; and by the Central Manchurian railway, from Harbin to Changchun, with a branch line of 70 miles from the latter place to Kirin. Southern Man-

churia—the Japanese sphere of influence—is crossed by the South Manchurian railway, a continuation of the Central Manchurian from Changchun to Port Arthur and Dairen; and in the west by the Chinese line from Shanhaikwan to Newchwang and Sinmintun. The South Manchurian railway has a total length of 634.6 miles, consisting of a trunk line from Kwanchengtse (Changchun) to Dairen, 437 miles; a branch line from Dairen to Port Arthur, 38.9 miles; a branch line from Yingkow to Tashih-kiao, 13.4 miles; a branch line from Suchiatan to Fushun, 34.6 miles; and a light railway from Antung to Mukden, 108.7 miles. The whole length from Dairen to Kwanchengtse has now been standardized. The South Manchurian Railway Company, organized and controlled by the Japanese government, operates the railways and adjacent mines. During the year ended March 31, 1908, its total receipts were \$6,246,472, and its total expenditure, including interest on bonds, etc., \$5,242,212. The coal mines yielded a net income of \$275,396; the harbor \$6146. The dividend paid was 6 per cent. In August, 1908, the company inaugurated a direct steamship service between Dairen and Shanghai. The American and Manchurian Line maintains a monthly service from New York to Dairen. For History see CHINA; RUSSIA; JAPAN.

MANGANESE. Ores of manganese are mined in the United States in order to meet the demand for this material in the brick, paint, and chemical industries, and to a less extent in steel making, where, though large quantities are used, it is considered preferable to employ the foreign high-grade manganese ores, which were imported in 1908 to the extent of 178,203 long tons, valued at \$1,350,223, as compared with 209,021 tons valued at \$1,793,143 in 1907, and 221,260 tons, valued at \$1,696,043, in 1906. These ores came mostly from British India, Brazil, Cuba, and the East Indies. In the form of spiegeleisen and ferromanganese, manganese enters into steel making in a number of ways, and especially for making the manganese steel used for railway rails and armor, for burglar-proof safes and vaults for car wheels, and other purposes where extraordinary strength and resistance are required. The addition of manganese to steel gives greater hardness, ductility, and strength.

The following table from the U. S. Geological Survey reports shows the quantity, the value, and the average price per ton of the manganese ore produced in the different States in 1906 and 1907:

State	1906		1907	
	Quantity long tons	Value	Quantity long tons	Value
Arkansas	62	\$290		
California	1	20	100	\$600
Georgia			800	4,800
South Carolina				
Tennessee	30	300	100	1,500
Utah	800	10,000		
Virginia	6,028	77,522	4,604	56,469
Total	6,921	88,132	5,604	63,369

MANITOBA. A province of Canada. (For area, see below, *History*.) Population in 1901, 255,211; in 1906, 808,863. Winnipeg, the capital, had 42,340 inhabitants in 1901, and 90,153 in 1906. For details respecting population, education, production, commerce, etc., see CANADA. The provincial government consists of a Lieutenant-Governor, appointed by the Governor-General of Canada and acting through a responsible ministry, and a unicameral legislative assembly of 40 members, elected for four years. The present Lieutenant-Governor is Sir Daniel Hunter McMillan, appointed for a second term on May 11, 1906. The present Premier is Romond P. Roblin.

HISTORY. The most important events in the political history of the province in 1908 were connected with Dominion legislation, especially with respect to an elections act which contained a provision revising the voters' lists in Manitoba previous to each Federal election. (See CANADA.) The Conservative government of Manitoba, of which Hon. R. P. Roblin is Premier, strongly opposed this measure because it was designed to take away Manitoba's control of the voters' list revision, substituting Federal for provincial revising officials. Other Dominion measures affecting the province were those extending the Manitoba boundaries, and the grain inspection and Manitoba grain acts. (See CANADA.) As a result of the first act, the area added is 178,479 square miles, making, with the previous area of 73,732 square miles, a total area of 252,211 square miles. The province is in area now practically equal to Alberta, Ontario, and Saskatchewan. There was some dissatisfaction reported because certain portions of the farming population could not secure telephone connection on as favorable terms from the government as under the former system. The ownership of interior grain elevators was strongly agitated. The report of the royal commission on Manitoba University recommended that its financial arrangements and control be placed entirely under the provincial government.

MANNING, WILLIAM T. An American Protestant Episcopal clergyman. He was born at Northampton, England, in 1866, came to America at the age of 10, and graduated in 1891 at the University of the South. He was ordained the same year and became rector of Trinity Church, Redlands, Cal. In 1893-96 he was professor of dogmatic theology at the University of the South. After serving as rector of parishes at Lansdowne, Pa., and Nashville, Tenn., he became vicar of St. Agnes' Chapel, Trinity Parish, New York City, in 1903. He became assistant rector in 1904; and during the same year declined the bishoprics of Kentucky and Harrisburg, Pa. On May 4, 1908, he was chosen to succeed Dr. Morgan Dix (q. v.) as rector of Trinity.

MANUEL II. King of Portugal, younger son of King Carlos I, succeeded to the throne upon the assassination of his father and the Crown Prince, Luiz Philippe, on Feb. 1, 1908. He was born on Nov. 15, 1889, and took the title of the Duke of Beja. He was trained as a sailor, serving as a midshipman on the man-of-war *Africa*. He got his primary education from his mother, who continued to exercise the greatest influence over him throughout his youth. He was said to have little liking for literature or

the arts, though he speaks English, French, and Spanish fluently. See CARLOS I.; PORTUGAL.

MARCHESI, SALVATORE, Cavaliere de Castrone, Marchese della Rajata. An Italian baritone singer and teacher of singing, died on Feb. 20, 1908. He was born at Palermo, on Jan. 15, 1822, and studied singing under Raimondi and Lamperti. In 1838-40 he held a commission in the Neapolitan Guard. In 1848, being exiled from Italy as a revolutionist, he went to London and studied under Garcia. He married Mathilde Graumann, a concert singer, in 1852. After appearing together in grand opera they began teaching singing at the Vienna Conservatory. They went to Cologne in 1865, and settled in Paris in 1881. Although somewhat overshadowed by the reputation of his talented wife, Signor Marchesi was an excellent singer and a most successful teacher. He also translated several grand-opera librettos into Italian, notably those of Wagner's *Lohengrin* and *Tannhäuser*.

MARINE BIOLOGICAL LABORATORIES AND STATIONS. See BIOLOGICAL STATIONS.

MARRIAGE. See DIVORCE.

MARS. See ASTRONOMY.

MARSHALL ISLANDS. A group of islands in the Eastern Pacific, east of the Caroline Islands, a German possession. Area, 156 square miles; population, 15,000. In 1907 there were 103 whites (76 Germans). Cocoa-palm plantations cover about 5,000 acres. Phosphates have been discovered on the island of Nauen. Their depth has not yet been ascertained. A company has been formed to work them, and the output for 1908 was estimated at 75,000 tons. The imports in 1906 amounted to 1,096,000 marks (347,000 from Germany), and the exports, mainly copra to 571,000 marks (294,000 to Germany). The islands are administered by a Commissioner residing on the island of Jaluit, and are administratively attached to German New Guinea (q. v.).

MARTINIQUE. An island of the Lesser Antilles, a French colony. Area, 381 square miles; population (1901), 207,011, reduced to 182,024 as a result of the eruption of Mount Pelée on May 8 and Aug. 30, 1902. In 1906 there were 546 East Indian coolies. Fort-de-France, the chief commercial town, had 27,069 inhabitants in 1901. The site of St. Pierre (destroyed May, 1902) is now covered with tropical vegetation. But the city is slowly rising from its ruins; there are now a hotel, several warehouses, and between 500 and 800 people. The first visit of a merchant steamer in nearly six years took place on Feb. 21, 1908. The chief products are sugar, rum, cacao, coffee, and tobacco, besides tropical food crops. In 1906 there were grown 370 pounds of cotton. The imports and exports in 1907 amounted to 15,940,039 and 18,997,221 francs respectively, the trade with France being represented by 8,667,000 francs of imports and 17,254,000 francs of exports. There are 140 miles of railway. The colony is administered by a Governor and an elective General Council. It is represented in the French Parliament by a senator and two deputies. The local budget for 1907 balanced at 4,750,000 francs. The debt in 1907 stood at 4,470,000 francs. The military force in 1907 consisted of 781 Europeans. The expenditure of France for 1908 was fixed at 1,870,197 francs.

MARTY, GEORGES. A French composer and conductor, died on Oct. 11, 1908. He was born in Paris, in 1860, studied at the Conservatory, and won the *Prix de Rome* in 1892. In 1890 he became chorus-master at the Théâtre Lyrique. He was appointed to the same post at the Paris Opéra in 1893. In 1900 he became *chef d'orchestre* at the Opéra Comique. His works include a music-drama, *Le Duc de Ferrare* (1900), a musical pantomime, an overture, several suites, and other vocal and instrumental pieces.

MARYLAND. One of the Middle Atlantic Division of the United States. Its area is 13,327 square miles, of which 3,386 square miles are water. The population in 1908, according to a Federal estimate, was 1,304,566. The largest city is Baltimore, with an estimated population in 1905 of 546,000.

MINERAL PRODUCTION. Coal and pig iron are the leading mineral products of the State, and in the output of these minerals important gains have been made in recent years. The production in 1907 was 5,532,628 short tons, with a spot value of \$6,623,697. In spite of the business depression which began in October, 1907, and which seriously affected the coal-mining industry during the last three months of the year, the production exceeded that of any previous year in the history of the State. Compared with the production of 1906 there was an increase of 197,175 tons, while the value increased \$148,904. The production has grown in the last ten years from 4,024,688 tons mined in 1900. The average number of men employed in the coal mines of the State in 1907 was 5,880, as compared with 6,488 in 1906, and 5,948 in 1905. The large production of pig iron is not based on local ores, but on ores from Cuba and Spain. The industry has grown from an output in 1905 of 332,096 long tons to 386,709 in 1906 and 411,833 in 1907. Clay products were produced in the State in 1907 to the value of \$1,886,362, as compared with a value of \$2,136,539 for the same products in 1906. The production of lime in 1907 was 103,423 short tons, valued at \$324,316, as against 127,863 tons valued at \$1,350,460 in 1906. The State produces a considerable amount of mineral water. In 1907 the production was 1,023,562 gallons, valued at \$110,039. There was produced in the State for 1907 slate to the value of \$118,060, as against a value for the same product in 1906 of \$130,969. The value of the stone products of the State in 1907 was \$1,439,355, of which granite amounted to \$1,183,753. There were also found small quantities of cement, flint, glass-sand, iron ores, metallic paint, sand-lime brick, talc, and soapstone. According to the figures of the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$19,356,250, as compared with a value in 1906 of \$22,939,894.

The production of coal in Maryland in 1908 was 15 to 20 per cent. less than in 1907. As all of the product of the State is high-grade semi-bituminous coal used by the railroads, practically all of the decrease was due to the panic and to the depressed conditions that followed. The demand for coal at the close of the year showed little or no improvement over that of the earlier months.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to the figures of the

United States Department of Agriculture were as follows: Corn, 24,705,000 bushels, valued at \$15,317,090 from 675,000 acres; winter wheat, 12,546,000 bushels valued at \$2,295,000 from 765,000 acres; oats, 765,000 bushels, valued at \$405,000 from 30,000 acres; barley, 30,000 bushels, valued at \$20,000 from 1,000 acres; rye, 285,000 bushels, valued at \$219,000 from 19,000 acres; buckwheat, 166,000 bushels, valued at \$126,000 from 9,000 acres; potatoes 2,464,000 bushels, valued at \$1,823,000 from 32,000 acres; hay, 480,000 tons, valued at \$5,760,000 from 300,000 acres; tobacco, 18,200,000 pounds, valued at \$1,365,000 from 26,000 acres. The production of corn increased from 22,196,000 bushels in 1907, while the production of potatoes was slightly less. Hay showed a considerable increase, the production in 1907 being 396,000 tons. The production of tobacco increased from 16,962,000 pounds in 1907. Market gardening and fruit and vegetable canning are extensive industries of the State. The numbers of farm animals have changed little since 1900, except for an increase in the number of sheep and a decrease in the number of swine. The estimated value of the wool clipped in 1908 was \$166,375.

MANUFACTURES. Moderate progress was made in manufacturing between the censuses of 1900 and 1905. The latter reported factories with \$201,877,966 capital, 94,174 wage-earners, and products valued at \$243,375,996, these items being, respectively, 35.3, .01, and 15.3 per cent. larger than in 1900. Of the wage-earners, 25,149 were women and 5,533 were children under 16. The values credited to leading industries and the per cent. of increase over 1900, in parentheses, were: Men's clothing, \$10,654,916 (13.4); canning and preserving, \$12,686,711 (9.3 per cent. decrease); iron and steel, \$12,230,409 (40); foundry and machine shop products, \$9,172,034 (8.6); flour and grist mill products, \$7,318,212 (1.1); tinsmithing, \$6,833,452 (14.8); fertilizers, \$6,631,763 (20.9); slaughtering and meat packing, \$6,332,914 (25.4), and shirts, \$5,998,249 (50.5). In 1905 Maryland ranked third in men's clothing and second in canning and preserving and in the manufacture of fertilizers. The clothing industry is carried on entirely in Baltimore. In the canning industry tomatoes, corn, peas, and beans are the principal vegetables used, and peaches, pears, and strawberries the principal fruits. Of the value of products, \$151,546,580 was credited to Baltimore.

EDUCATION. A law passed in 1904 provided that no white teacher having an average of fifteen or more pupils should receive less than \$300 a year. The Legislature extended this and provided that no teacher holding a first-class certificate who had taught three years should receive less than \$350 a year; five years, \$400, and eight years, \$450. The State school tax is 16 mills per capita and from the proceeds \$150,000 is deducted for free text books. The State makes a special appropriation for manual training departments of high schools (21), \$1,500 each, and \$1,500 to each of the 11 colored industrial schools. The laws of 1908 appropriated \$1,000 each to the 41 high schools for the maintenance of a commercial department. In the school year ending July 31, 1908, there were 350,319 persons of school age (5 to 20 years) in the State. Of these 140,771 were in Baltimore. The total school enrollment was

236,656, of which 89,180 were in Baltimore. The average attendance was 139,474. The teachers numbered 5,357, of whom 4,477 were females. The length of the school year is 9.7 months, and the average yearly salary of teachers outside of Baltimore was \$334.93 as compared with \$752.84 in Baltimore. There were 528 colored schools open for an average of seven months, employing 780 teachers and having a total enrollment of 43,802, and an average attendance of 22,987. There were 41 graded high schools, carrying out the full State course of study and subject to State inspection. The total disbursements for public schools was \$3,664,692.69. Of this amount, \$2,087,746.82 was raised by local taxation. In addition to the generous aid given to public schools, the State makes appropriations to more than 40 private academies, schools, colleges, and universities.

FINANCE. The report of the Comptroller of the Treasury for the fiscal year ending Sept. 30, 1908, showed a balance in the treasury on Sept. 30, 1907 of \$1,364,881. The gross receipts during the fiscal year were \$4,513,255, and the total disbursements \$4,639,483, leaving a balance in the treasury Sept. 30, 1908, of \$1,238,052, against which were chargeable funds due amounting to \$908,131, leaving a balance applicable to ordinary expenses of \$330,520. The chief sources of revenue were from licenses, from taxes for general purposes, and for taxes on corporations, etc. The funded debt of the State on Sept. 30, 1908, amounted to \$6,078,926, which was an increase of \$100,000 over the debt in 1907.

CHARITIES AND CORRECTIONS. The chief charitable and correctional institutions of the State are a hospital for consumptives at Eudowood; the Maryland Hospital for Insane at Catonsville; Springfield State Hospital, Sykesville; Maryland Tuberculosis Sanitarium, Sabillasville, and Baltimore Orphan Asylum. Besides there are many private institutions which receive aid from the State.

POLITICS AND GOVERNMENT. William Pinkney Whyte, who had been appointed by the Governor United States Senator, and then elected by the legislature to fill the unexpired term of the late Senate Gorman, died on Mar. 17. John Walter Smith, who a short time before had been elected to succeed Senator Gorman for the term beginning Mar. 4, 1909, was elected also to fill the unexpired term of Senator Whyte. The most important work of the legislature of 1908 was the appropriation of \$5,000,000 for the improvement of the roads of the State. Several political laws relating to elections and corrupt practices were passed. A general local option bill was rejected. The measure, although it was strongly supported by the Anti-Saloon League, and other bodies, failed of passage, being killed in the General Assembly on Mar. 11, by a vote of 56 to 43. A bill was passed increasing the license fees in Baltimore. An enabling act for a constitutional amendment which, if ratified by the people at the November election of 1909, will disfranchise illiterate negroes in the State, was passed.

CONVENTIONS AND ELECTIONS. The Republican convention to select delegates to the National Convention met at Baltimore on April 30. Resolutions were adopted instructing the delegates chosen to vote for William H. Taft for President. The Democratic State Convention met at

Baltimore on June 3. An unsuccessful attempt was made to secure the passage of a resolution endorsing William J. Bryan for President. Such strong opposition developed that this was found to be impossible, and the delegates were instructed. The election of Nov. 3 resulted in the division of the electoral vote in the State. The highest Taft elector had a majority of 613 over the highest Bryan elector (Taft 116,523; Bryan 115,910). In spite of this, however, the Democrats elected six electors in the State and the Republicans two. There was a difference of 3,376 votes between the highest and the lowest Republican elector. The ballot used was simple in form, similar to that used in Massachusetts, but mistakes were made in marking it by several thousands who could not read the names of candidates.

OTHER EVENTS. On May 4, Mayor Mahool of Baltimore removed from office two commissioners for opening streets who were charged with demanding and receiving money for paving contracts. The amount alleged to have been paid was \$10,000. In a collision on June 5, between two electric cars near Annapolis, 8 persons were killed. In May the General Conference of the Methodist Episcopal Church (q. v.) met at Baltimore.

LEGISLATION. Among the important measures passed at the legislative session of 1908 were the following: Provision was made for incorporation under the general law "for any lawful measures"; measures were enacted prohibiting the practice of law or giving of legal advice without admission to the bar, and stringent laws were enacted against barratry, measures were enacted providing for retiring aged and indigent teachers of public schools upon a pension of \$200 a year, a measure was passed consenting to the acquisition by the United States of lands in the mountain regions of Maryland for the establishment of a national forest reserve, professional Christian Science healers were brought within the statutory regulations concerning practitioners of medicine, several measures relating to railroads were enacted as well as important acts relating to elections.

STATE OFFICERS: Governor, Austin L. Crothers; Secretary of State, N. Winslow Williams; Treasurer, Murray Vandiver; Comptroller, Joshua Herring; Adjutant-General, Henry W. Warfield; Attorney-General, Isaac L. Strauss; Superintendent of Education, M. Bates Stevens; Commissioners of Insurance, B. Frank Crouse; Commissioner of Public Lands, Thos. A. Smith—all Democrats.

JUDICIARY. Court of Appeals: Chief Judge, James McSherry; Associate Judges, N. Chas. Burke, A. Hunter Boyd, Henry Page I. Thomas Jones, John P. Briscoe, S. D. Schmucker, and James A. Pearce; Clerk, Caleb C. Magruder—all Democrats except Schmucker, Republican.

The State legislature of 1909 is composed of 17 Democrats, 9 Republicans, and 1 Independent Democrat in the Senate and 71 Democrats and 30 Republicans in the House. The State representation in Congress will be found in the article UNITED STATES, under the section Congress.

MASCART, ELEUTHÈRE ELIE NICOLAS. A French physicist, died on Aug. 26th, 1908. He was born at Quarouble, near Valenciennes, on Feb. 20th, 1837, was educated at the École Normale Supérieure and became conservator of

the collections in that institution. In 1872 he succeeded Regnault at the Collège de France, and in 1878 he became director of the Central Bureau of Meteorology in Paris, which position he continued to hold until 1907. He greatly improved the equipment and organization of this bureau and instituted the regular publication of weather forecasts and weather charts. Mascart first interested himself in optics, and was one of the first to employ photography in spectrum analysis. In 1862 he devised a spectrograph of which he made successful use in photographing ultra-violet spectra, adding new lines of those already charted. He also did some very skilful work in the analysis of wave-lengths, and in the investigation of interference phenomena. In 1876 he published a work on static electricity, wherein he presented the potential theory developed from the work of Green and of Lord Kelvin, and in 1877 he contributed to the *Journal de Physique* a description of the elementary theory of magneto-electric, and electrodynamic machines, including the first correct statement of the law of efficiency of motors. In 1881-84 he worked out anew the unit of resistance. He was elected to the Academy of Sciences in 1884, in place of Samin, and in 1904 became its president. His publications include *Traité d'optique* (4 vols., 1890-93), and *Traité de magnétisme terrestre* (1900).

MASON, OTIS TUFTON. An American ethnologist, died on Nov. 5th, 1908. He was born in Eastport, Maine, on Apr. 10th, 1838, graduated at the Columbian University in 1861, and in 1861-84 had charge of the preparatory school of that institution. He became curator of ethnology in the National Museum in 1884, and since 1902 had been head curator of the department of anthropology. With D. M. Toner and Garrick Mallory he was responsible for the founding of the Anthropological Society of Washington; he was anthropological editor of the *American Naturalist* for a time. He was appointed a member of the National Board of Geographic Names in 1890. Professor Mason did no field work, but he rendered great service to science by his lucid and precise descriptions of the great collections in the Smithsonian Institution, and especially those relating to the American aborigines. He arranged and classified the hitherto unclassified anthropological collections in the Smithsonian, making of them the basis of the present great archaeological and anthropological exhibits. On the objects in these collections he wrote a great number of papers, published by the Institution, including such titles as "Cradles of the American Aborigines" (1887); "North American Bows, Arrows and Quivers" (1893); "Migration and Food Quest" (1894); "Aboriginal American Baskerty" (1884 and 1892), and several contributions to the *Hand-Book of American Indians* (1907).

MASON, WILLIAM. An American pianist, composer, and teacher of music, died on July 14th, 1908. He was born in Boston, on Jan. 24th, 1829. He studied music in his native city, and appeared in public, as a pianist, in 1846; and later, studied abroad, under Moscheles, Hauptmann, Richter, Liszt, and others. In 1853 he gave a series of successful concerts on the Continent, and returning to the United States soon afterwards, made several successful tours here. In 1855, with Theodore Thomas, he organized the Mason and Thomas chamber music recitals. He

now settled in New York City and devoted himself to teaching, at which he was uniformly successful. He composed several works, chiefly for the pianoforte, and wrote several very valuable text-books. These are: *A Method for the Pianoforte* (1867); *A System for Beginners* (1871); both of these in collaboration with E. S. Hoadley; *Touch and Technic* (1878); *Pianoforte Technics* (1880, with W. S. B. Matthews). His *Touch and Technic* is still one of the standard treatises on piano playing. In 1901 he published a volume of reminiscences, under the title, *Memories of a Musical Life*.

MASSACHUSETTS. One of the North Atlantic Division of the United States. Its total area is 8,266 square miles. The population, according to a Federal estimate made in 1908, was 3,122,680. The largest cities are Boston, which had a population in 1906 of 602,678; Worcester, 130,078; Fall River, 105,942; Lowell, 95,173, and Cambridge, 98,554.

MINERAL PRODUCTION. The most important single mineral product of the State is granite, in the production of which Massachusetts in 1906 supplanted Maine in first place. The output for 1907 was valued at \$2,328,777, as against a value for the same product in 1906 of \$3,327,416. The value of the marble produced in 1907 was \$212,438, as against a value for the product of 1906 of \$271,934. The stone products of the State included also trap rock, sandstone, and limestone. The total value of the stone products in 1907 was \$3,218,979, as against a total value in 1906 of \$4,333,616. Massachusetts ranks seventh among the States in the production of stone. The clay products of the State in 1907 were valued at \$2,128,820, as against a value for the same product in 1906 of \$2,172,733. The State is an extensive producer of lime. In 1907, 119,072 short tons, valued at \$596,778, were produced, as compared with 119,267 tons, valued at \$563,100, in 1906. The State is notable in the productions of mineral waters. In 1906, 4,661,115 gallons were produced, valued at \$208,579, as against 3,857,955 gallons, valued at \$210,152, in 1906. Among other mineral products of the State are copper, glass sand, pig iron, sand and gravel, alum and aluminum sulphate, asbestos, coke, fuller's earth, iron ores, litharge, pyrite, red lead, salt, talc and soapstone, Venetian red, and white lead. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production in the State in 1907 was \$6,584,181, as compared with a value in 1906 of \$16,770,561.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 36,000 bushels, valued at \$29,000, from 2,000 acres; potatoes, 3,040,000 bushels, valued at \$2,584,000, from 32,000 acres; hay, 702,000 tons, valued at \$11,934,000, from 585,000 acres; oats, 231,000 bushels, valued at \$43,000, from 7,000 acres; rye, 66,000 bushels, valued at \$63,000, from 4,000 acres; tobacco, 7,444,800 pounds, valued at \$1,153,944, from 4,512 acres. The production of hay showed a decrease in 1908 from the production of 1907, which was 760,000 tons. There was an increase in the acreage and production of tobacco, which, in 1907, was 7,167,500 pounds, from 4,700 acres. The numbers of farm animals on January 1, 1909, were as follows: Horses, 83,000; dairy cows, 194,000; other cattle, 90,000; sheep, 45,000; swine, 69,000. The

increase in the number of sheep over the figures of 1907 is about 33 per cent., and in the number of horses and dairy cows about 7 per cent. The number of meat cattle and swine has decreased in recent years. The wool clipped for 1908 was estimated at 203,000 pounds, valued at \$51,806.

MANUFACTURES. The statistics of manufactures for 1907 given below are taken from the *Annual Report* of the Bureau of Statistics of Labor. The whole number of establishments making returns in the year was 5,671, with a product valued at \$1,364,431,255. There has been a great increase in the value of manufactured products since the special Federal census of 1905. This census, which represented a total of 10,723 establishments, reported a value of products of \$1,124,092,051. The following comparison may be made between the figures of the state census in 1907 and the Federal census of 1905, showing the increase in production during that period. The amount of capital invested was given in 1905 as \$965,948,887. These figures cannot be exactly compared with the figures of the State Bureau for 1907 because in the Federal census the definition of capital invested differed from that adopted by the State Bureau, which limited capital invested to capital actually devoted to production. According to the Federal census of 1905 the value of stock and material used was \$626,410,431: in 1907, \$779,840,958; the wage-earners in 1905 numbered 488,395; in 1907, 539,982; the total amount paid in wages in 1905 was \$232,388,946: in 1907, \$278,191,113; the average yearly earnings for employees in 1905 was \$475.82: in 1907, \$155.18. The tendency toward concentration of manufacturing plants in cities and large towns, and the consequent massing of the population in industrial centres, have greatly increased in Massachusetts in recent years. In 1905, out of a total value of a product of \$1,124,092,051, \$940,804,063 was produced in cities having a population of 8,000 or over, and in 1907, out of a total value of \$1,364,431,255, the value produced in towns having a population of over 8,000, was \$1,151,259,235, or 84.38 per cent. In 1907 there were 61 places of 8,000 inhabitants and over, aggregating 78.27 per cent. of the estimated population. The cities producing the largest value of manufactured products were Boston, \$190,248,668; Lawrence, \$70,632,098; Lynn, \$68,904,543; Worcester, \$68,623,320; Fall River, \$67,671,481; and Lowell, \$62,262,594. The most valuable manufactured product was cotton goods, which was valued in 1907 at \$193,276,574, and if woollen and worsted goods be included, the product value of textiles was \$326,206,933. The manufacture of boots and shoes, although less capital is invested therein, is the principal industry of the State. In 1907 the value of the product was \$233,025,182 or more than one-sixth of the capital. Next in value are the food preparation industry, \$101,802,690; machines and machinery, \$79,342,230; and metals and metallic goods, \$73,124,952.

FISHERIES. Massachusetts ranks first among the States in the value of fisheries. Statistics for 1907, published in 1908, showed products amounted to 205,743,374 pounds, valued at \$5,525,230.91. The values of the principal catches in 1907 were: Haddock, \$1,167,226; cod, fresh, \$1,212,155, and salted, \$575,097; mackerel, fresh, \$293,354.51, and salted, \$472,058; pollock, \$244,782.89; hake, \$317,404; halibut, \$343,402. Swordfish, squeteague, cusk, and flounders also represented large values.

EDUCATION. A school census of the State was taken on Sept. 1st, 1907. This showed the total number of persons of school age between 5 and 15 years of age as 538,654. The enrollment in the public schools during the year was 524,319. The average daily attendance was 466,214. The number of teachers in the public schools was 13,497 women and 1,281 men. The average wage per month of male teachers was \$155.95 and of female teachers was \$59.58. There were in the State in 1907-08, 266 high schools, with 2,073 teachers and 51,527 pupils. The expenditure for high schools was \$2,862,617. The total expenditure for the support of public schools was \$14,697,774. Of this sum the teachers' wages amounted to \$10,683,342. There was expended for new school houses \$2,610,432. The amount of local funds whose income must be appropriated for public schools was \$1,288,517. There were in the State ten normal schools, 1,876 students, and 129 teachers.

The Board of Education in its report of 1907-08 strongly urges the enlargement of opportunities for industrial education in the public schools and asks for State encouragement to assist these schools to undertake this enlargement of their usefulness.

FINANCE. The report of the State Treasurer for the fiscal year ending Nov. 30th, 1908, shows a balance on Nov. 30th, 1907, of \$2,142,841.24. The receipts for current expenses for the fiscal year 1908 were \$18,931,960.85. Temporary loans were made to the amount of \$4,100,000, making the total receipts for the year \$23,031,960.85. The expenditures for the year were \$18,700,088.93, leaving a cash balance on hand Nov. 30th, 1908, of \$2,374,713.16. The chief sources of revenue were from the sale of bonds, from securities matured, from institutions, etc., and from interest on investments. The chief payments were for investment for sinking funds, for the abolition of grade crossings, for metropolitan water supply, for metropolitan parks, for metropolitan sewerage for prisons and hospitals, for State highways, for charities, and for educational purposes. The receipts for funds for special purposes Nov. 30th, 1908, amounted to \$14,716,912.62, of which the funds for institutions comprised \$6,733,400.25. The total receipts from all sources for the year were \$39,748,873 and the total expenditures were \$39,657,346, leaving cash on hand Nov. 30th, 1908, of \$5,757,446.

CHARITIES AND CORRECTIONS. Since 1904 the State has assumed full responsibility for the care and support of all insane persons, many of whom had previously been cared for by cities and towns. In October and December, 1907, the latest date for which statistics are available, the population of the institutions for the insane under the State Board was as follows: Worcester, 1,132; Taunton, 938; Northampton, 773; Danvers, 1,232; Westboro, 907; asylums for the insane at Worcester, 933; Medfield, 1,456; State Colony for Insane, 428; Massachusetts Hospital for Epileptics, 558 (only one-half of them insane); Massachusetts School for Feeble Minded, 1,157. The total number of inmates was 9,798; the total expenditures for these institutions during the year were \$2,101,474. The number of prisoners on Oct. 1st., 1907, in the State prison at Charlestown, was 799; at the Reformatory at Concord, 823; at the Reformatory prison for Women at Sherburn, 142; State farm at Bridgewater, 1,043; Prison Camp and Hospital at

Rutland, 70; and in jails and houses of correction, 2,779. The expenditures for the five State institutions during the year 1907 aggregated \$452,358. The total expenditures for county jails and houses of correction for the year amounted to \$617,970.

POLITICS AND GOVERNMENT. The attempted merger of the Boston & Maine Railroad, with the New York, New Haven & Hartford Railroad, begun in 1907, continued to be a subject of political agitation during 1908. A special commission on commerce and industry appointed in July, 1907, reported early in the year in favor of permitting this consolidation, and a bill introduced into the Legislature in opposition to this action was defeated. On May 22d a bill in equity was filed by the Federal government in Boston to restrain the New York, New Haven & Hartford from exercising any control over the Boston & Maine. On July 31st a demurrer to this action was filed by the New York, New Haven & Hartford Railroad Company in the United States Circuit Court. At the same time the company filed a complaint against the Interstate Commerce Commission protesting against its attempt to enforce the eight-hour law for employees on the railroad. The matter was pending in the courts at the close of 1908.

Radical changes in the liquor policy of the State were brought about on May 1st, as a result of elections previously held. Three of the largest manufacturing cities, after long periods of license, gave up the liquor traffic. Worcester, with a population of 130,000, became the largest municipality in the country, if not in the world, under a no license régime. Licenses of 128 places, including 17 hotels, became void. Lynn also abolished saloons for the first time in twelve years. The same action was taken in Haverhill. In all, six cities and 36 towns abolished license. On May 21st, the Supreme Judicial Court of the State sent an opinion to the House of Representatives that the tax on transfers of stocks was unconstitutional.

The Finance Commission, appointed in 1907 by Mayor Fitzgerald of Boston, to investigate conditions in that city, made several reports during the year. On Apr. 17th the Commission issued a report dealing largely with combinations. It was declared that three sorts of combinations had been discovered: those among boiler makers; those among contractors for fireproofing, and those among concerns engaged in the manufacture and supply of structural steel. These combinations, it is alleged, were brought about by common agreement in which one bidder would be named to do the work at a certain price, and a certain percentage of the accepted profit would be assigned to each of the bidders, and the bids, so graded that a concern designated would be sure to be successful, were then submitted as if in good faith. In several places, in place of bids made in collusion, payment was made by one company to the others for abstaining from competition. The most notorious offenses were those committed by the combinations in the structural steel trade. The Finance Committee reported that this combination included "substantially all the local concerns and many of the largest corporations in the United States engaged in manufacturing or furnishing structural steel for use in any part of New England." On Nov. 15th the Commission reported on the purchase of coal by the city, contracts for flagging, stone crusher con-

tracts, and the purchase of Fourth of July prizes, declaring that "a lamentable picture of dishonesty and greed was disclosed." The chief complaint in the report was against the absence of competitive bids for contracts covering purchases involving more than \$2,000, which are required by law. During 1907 the Commission found that but 52 per cent. of such bids were authorized. The Commission recommended more general observance of the statute; an amendment making \$1,000 the limit above which contracts must be advertised; more general solicitation of competitive bids in the cases under \$1,000; and an amendment providing a penalty for violation of the statute "sufficient to cause a strict observance of the law on the part of members of the city council." In 1907 the General Court passed a law providing for savings bank insurance. This measure authorized any savings bank, under specified conditions to accept, for accumulation in a fund separate from its ordinary savings department, deposits to be applied to insurance and annuities. Several banks in the State took advantage of this provision in 1908 with considerable degree of success. See **BANKS AND BANKING.**

CONVENTIONS AND ELECTIONS. The Republican State Convention for the selection of delegates to the National Convention was held in Boston on Apr. 10th. An attempt was made to have the delegates to the convention instructed to vote for William H. Taft. The result was a compromise endorsement, the platform holding that the convention recognized that the "majority of the delegates to the convention desired Taft's nomination," but that it was "uncertain whether a resolution of preference would be carried, and its presentation would certainly lead to a contest which would be injurious to the welfare of the party." The convention adopted resolutions endorsing Governor Curtis Guild, Jr., as a candidate for the Vice Presidential nomination, and advocating a "wise revision" of the tariff. Resolutions were adopted praising the administration of President Roosevelt. The Democratic State Convention met at Boston on May 7th. An attempt to pass resolutions instructing the delegates to vote for William J. Bryan resulted in such instructions being given only to the delegates at large. The proceedings were marked with great disorder. The platform contained planks declaring that corporations should be forbidden to issue watered stock; should forfeit charters for political contributions and should, if foreign, be subject to the jurisdiction of State courts; railroads should be restricted to fair profits on fair valuation, and restrained from discrimination by imprisonment of officials.

The Republican State Convention for the nomination of candidates for the State ticket was held in Boston, Oct. 3d. Eben S. Draper, Republican Lieutenant Governor of the State for three years, was nominated for Governor. The most notable event of the convention was the contest between Louis A. Frothingham, former Speaker of the House, John N. Cole, Speaker of the House, and Robert Luce, for the nomination for Lieutenant-Governor. The Lieutenant Governor, according to Massachusetts tradition, is the logical candidate for Governor. On the first ballot, Mr. Frothingham lacked only 16 of the 770 votes necessary for a choice. Speaker Cole had 443 and Mr. Luce 331. Both withdrew when the result was announced, and Mr. Frothingham was nominated by acclamation. In 1904 he had resigned

as Speaker of the House at the request of the party leaders to run against John F. Fitzgerald for Mayor of Boston. He was defeated and the action of the convention was considered to be a reward for this sacrifice. The Democratic State Convention, held on Oct. 2d, nominated John H. Vahey for Governor.

In the election of Nov. 3d, William H. Taft received a plurality in the State of about 110,000, exceeding Roosevelt's plurality of 1904. Eben S. Draper received a plurality of about 26,000 for Governor. The detailed vote for National and State tickets was as follows: Taft, 265,966; Bryan, 155,453; Chafin, 4,374; Debs, 10,779; Draper, 228,318; Vahey, 168,162. The vote in Boston was exceedingly close. The city was carried for William J. Bryan by a plurality of only 24, the vote being Bryan 41,207, and Taft 41,183. In 1904 Parker carried the city by 10,600 votes. Vahey carried Boston by about 12,000. Municipal elections were held in 21 cities on Dec. 8th, all but one electing mayors. Fall River voted no license for the first time in years, and Gloucester voted again for no license after a year under license. Worcester voted for another year of no license by a majority of only 176 votes. In most of the cities the mayors were re-elected.

OTHER EVENTS. On Apr. 12th fire destroyed nearly one-third of the city of Chelsea, causing a loss of nearly \$10,000,000. For labor troubles in the State in 1908, see **STRIKES**. The city of Haverhill adopted a plan of city government similar to that adopted in 1907 by the city of Des Moines, Iowa. (See **MUNICIPAL GOVERNMENT**.) On June 8th a fire on the harbor front of East Boston caused a loss of property valued at \$1,600,000.

A new tunnel extending from Haymarket Square, under Washington street, for a distance of about a mile to Pleasant street, Boston, was opened to traffic in the first part of December in Boston. The tunnel was constructed at a cost of about \$10,000,000 and has been leased to the Boston Elevated Railroad for 25 years.

LEGISLATION. Among the important measures passed at the legislative session of 1908 were the following: Measures providing for the purchase of forest land and for reforestation. Several important measures were enacted relating to labor arbitration. The doctrine of assumed risks and also that of fellow servants where the employer was a railway corporation was abolished. Instruction was provided in the public schools as to tuberculosis and its prevention, and the manufacture and sale of cocaine was prohibited. Political committees and other representatives are prohibited from soliciting from candidates for their nomination money or promises to pay money as a prerequisite to obtaining nomination papers. Several other measures relating to elections were passed. An act was passed authorizing proceedings by the Attorney General to restrain by injunction the carrying out of any agreement for the creation of a monopoly for the sale of articles in general use.

STATE OFFICERS. Governor, Eben S. Draper, Republican; Lieutenant Governor, Louis A. Frothingham; Secretary of State, William M. Olin; Treasurer, Arthur B. Chapin; Auditor, Henry E. Turner; Adjutant General, W. H. Brigham; Attorney General, Dana Malone; Secretary of the Board of Agriculture, J. Lewis Ellsworth; Commissioner of Insurance, Frank C. Hardison—all Republicans.

JUDICIARY. Supreme Judicial Court for the Commonwealth: Chief Justice, Marcus P. Knowlton; Justices, James M. Morton, Arthur P. Rugg, Henry Newton Sheldon, John W. Hammond, William C. Loring, and Henry K. Braley; Clerk of the Court, Walter F. Frederick—all Republicans.

The State Legislature of 1908, was composed of 34 Republicans and 6 Democrats in the Senate, 172 Republicans, 59 Democrats and 9 others in the House. The state representation in Congress will be found in the article UNITED STATES, under the section Congress.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY. An institution for higher scientific training in Boston, founded in 1861, opened in 1865. The attendance in the autumn of 1908 was 1,462, which was an increase of 50 over the registration of the previous year. The graduate class in June, 1908, numbered 230, and of those who received degrees, 70 came to the institute from other colleges. During the year the heating and power plant was rebuilt and has now one of the best boiler plants in New England. In the engineering laboratory a new steam turbine has been installed for experimental purposes. During the summer of 1908 a building was constructed as a social hall for students, called the Technology Union. Meals are served at low rates to students and a large hall is provided for social purposes. Physical training has been made compulsory in the first year. The endowment of the institute is \$1,875,000 and its annual income in 1908 was \$494,630.98, of which fees received from students amounted to \$318,392. Since June, 1907, the presidency has been vacant, and Professor Arthur A. Noyes has performed the duties of acting President. Professor Richard A. McLaurin, Professor of Physics of Columbia University, was elected President in 1908, and will take office at the beginning of the school year 1909.

MATHEW, Sir JAMES CHARLES. A British jurist, died on Nov. 9th, 1908. He was born in Bordeaux on July 10th, 1830, and was admitted to the bar in 1854, where he rapidly established a high reputation for ability. Among the cases in which he appeared was the famous Tichborne case in 1873. He was appointed to the bench in 1881 and became a lord-justice of appeal in 1901. He served in 1892 as chairman of the Evicted Irish Tenants' Commission. He was a nephew of Theobald (Father) Mathew, the famous Irish apostle of temperance.

MAURITANIA. A French possession in the western Sahara, extending from Morocco in the north to the colony of Senegal in the south. The administration is in the hands of a Commissioner, who is under the Governor General of French West Africa (q. v.).

MAURITIUS. An island in the Indian Ocean, a British crown colony. Area, 705 square miles; population (1906), 375,400, mostly East Indian coolies. Port Louis, the capital, had 52,740 inhabitants in 1901. Almost the entire area is devoted to sugar cultivation. The output of sugar was 214,000 tons in 1906-7, 167,000 tons in 1907-8, and 200,000 tons in 1908-9. The export of raw sugar in 1907 was 195,746,056 kilos (1 kilo=2½ lbs.), of which India took 125,686,204 kilos; Great Britain, 27,953,851; Cape Colony, 25,351,190; Argentina, 4,460,185; Australia, 4,448,752; Natal, 2,737,537; Delagoa Bay, 2,612,824. The imports and exports of Mauritius

in 1907 amounted to Rs. 31,161,095, and Rs. 43,829,279, respectively (1 rupee=32.44 cents). The trade is chiefly with British India (Rs. 14,700,531, and Rs. 27,599,685 for imports and exports, respectively); Great Britain (Rs. 7,980,799 and Rs. 6,668,904); Cape Colony, France, and Madagascar. The export of raw sugar in 1907 was valued at Rs. 32,588,335, other exports being aloe fibre, molasses, cocoanut oil, rum, and vanilla. There are 132 miles of railway and 250 miles of telegraph line. The revenue in 1906-7 was Rs. 10,329,618; the expenditure, Rs. 10,174,508; and the public debt, £1,315,590. The British garrison in 1908-9 numbered 1,418. The Governor in 1908 was Sir Cavendish Boyle. Attached to Mauritius are the islands of Rodrigues, Oil Islands, and St. Brendon or Cargados Islands, with a total area of 130 square miles and a total population of 5,440 in 1906.

MAYOTTE AND DEPENDENCIES. See COMORO ISLANDS.

MEAT AND MEAT INSPECTION. During the fiscal year ending June 30th, 1908, the Federal meat inspection was extended so that practically five-ninths of the animals slaughtered for food in the United States were inspected. Inspections was conducted at 787 establishments in 211 cities and towns, as compared with 163 in 58 cities and towns during the year that ended June 30th, 1906, the last previous to the new law. The number of animals slaughtered under inspection increased from 42,901,284 in 1906, to 53,973,337, of which 35,113,077 were swine, 9,702,545 were sheep, 7,116,275 were cattle, 1,995,487 were calves, and 45,953 were goats. This was an increase of 6 per cent. over 1907. In the examinations 175,126 carcasses and 704,666 parts were condemned, 108,519 carcasses were passed for lard and tallow, and 53,689,692 carcasses were passed for food. The number of animals inspected before slaughter was 54,059,901, as compared with 50,999,034 in 1907. Tuberculosis was the cause of rejection of about three-fourths of the cattle carcasses and two-thirds of the hog carcasses that were condemned. The majority of the other condemned hogs were affected with hog cholera and swine plague. Nearly 1 per cent. of the adult cattle and over 2 per cent. of the hogs inspected were found affected with tuberculosis in some degree. The financial loss due to condemnations for tuberculosis in these Federal meat inspections during the fiscal year was computed by Dr. A. D. Melvin, chief of the Bureau of Animal Industry, as \$2,112,436. The inspection for trichina, which was inaugurated in 1892 to meet the requirements of Germany and other countries which forbade the importation of American pork unless it had been microscopically inspected, was discontinued in 1907, as experience had shown that under practical conditions a reliable inspection for trichina is not possible. Such inspection was not considered necessary for the protection of the American public as the only danger of contracting trichinosis comes from eating pork in a raw, uncured state, which is not the custom among the people of this country. There were condemned on reinspection 43,344,206 pounds of meat products, which had become sour, tainted, putrid, unclean or, in the case of fats, rancid, since inspection at slaughter. A total of nearly six billion pounds of meat food products were passed on by the government inspectors. An increase of 13.8 per cent. over the previous year

was reported in the meats and meat products certified for export.

The first step in the work is that of the inspection of the living animals in the stock yards or pens, before they enter the abattoirs. Animals that do not appear to be perfectly sound or healthy are marked by attaching to their ears numbered tags that bear the words "U. S. Suspect." Such animals are segregated and slaughtered separately under special inspection. All animals are inspected again as they are slaughtered, and if evidence of disease is found, the affected carcasses are marked with tags bearing the words "U. S. Retained," and then sent to a compartment called the retaining room. There a thorough examination is made and it is determined whether they shall be passed for food, rendered into lard or tallow, or condemned. Carcasses there passed as fit for food are removed and placed with other healthy ones, while those in which the suspicion of disease is confirmed are stamped "U. S. Inspected and Condemned," and destroyed for food purposes. Before entering the chilling room each side of beef passed is marked "U. S. Inspected and Passed," with purple indelible ink, in five or more places. To this is added the establishment number, which serves as a convenient means of reference and provides a sure method of identifying the meat, should any question arise concerning it. This mark is necessary under the law in order to procure the movement of meats between States.

The law in effect in 1908 applied to the inspection of all cattle, sheep, swine, and goats, their meats and meat food products slaughtered or prepared at any establishment doing an interstate or export business. The law does not, however, apply to animals slaughtered by farmers, retail butchers and retail dealers. The inspection dealt with the sanitary conditions of preparation, honesty of labeling, and with the various processes of preparing, curing, canning, etc., as well as with the health of the animals slaughtered. This resulted in greatly improved sanitary conditions and methods at the slaughter house and packing plants. The use of preservatives was not permitted except in strict accordance with the law.

The employees of the Bureau of Animal Industry engaged in the inspection work numbered 2,203, of whom 616 are veterinary graduates. These positions were filled through Civil Service examinations, which assured the employment of capable and expert men. The permanent annual appropriation of \$3,000,000 was found sufficient.

The accompanying table shows the effect that the agitation of 1906 had upon the export trade of the United States, and the extent to which it has recovered. The prejudice was directed against the canned goods and not against fresh beef, as there was an increase in the export of the latter, while the trade in the former dropped enormously. The figures given for 1908 show that this trade was gradually being regained. The decrease in the exports of fresh beef during 1908 was considered as due to the increased home demand as well as to the enormous development of the South American beef trade with Great Britain. In 1907 the imports of fresh beef into the United Kingdom were valued at £10,397,102, to which the United States contributed £5,170,593, and Argentina, £4,308,273. In 1908 British fresh beef imports were valued at £10,308,380, Argentina contributing £6,102,926, and the United States, £3,268,584.

EXPORTS OF PRINCIPAL MEAT PRODUCTS DURING THE PAST FOUR YEARS.

	Twelve months ending June 30.			
	1905	1906	1907	1908
	lbs.	lbs.	lbs.	lbs.

MEDICAL PROGRESS IN 1908. The science of preventive medicine attracted a large share of the attention of all civilized countries and substantial advances were made in protecting communities from the various communicable disease. (See **HYGIENE; PLAGUE; RABIES; TYPHOID FEVER; WINTER CHOLERA.**) Diseases prevalent in hot countries became of more and more vital concern to the great powers interested in colonial expansion and research was stimulated in this direction. (See **INSECTS AND THE PROPAGATION OF DISEASE; MALARIA; SLEEPING SICKNESS; TROPICAL MEDICINE.**) The problems of immunity, and the little known properties of the blood were the occasion of a large amount of speculation and laboratory investigation. (See **ANTITOXIN; BLOOD; SERUM THERAPY.**) Popular interest was thoroughly aroused to an extent hitherto unknown in the possible control and eventual extermination of those twin scourges of the human family, consumption and cancer, and the prospects for success were never better. (See **CANCER; TUBERCULOSIS.**) A number of new drugs was brought to the attention of the medical profession, some of them were found to be substantial helps in therapeutics. (See **BROMURAL; FLUORESCIN; LECIBRIN.**) The various forms of radiant energy continued to be used and new applications for them were discovered. See **PHOTOTHERAPY.**) There was an increasing tendency toward the restriction of the use of alcohol in most civilized countries; China was trying to overcome the national drug addiction; and laws were enacted in many of the United States against the illegitimate use of cocaine. (See **ALCOHOL; COCAINE HABIT; OPIUM HABIT.**) Other medical items or statistics will be found under their proper heads.

MENOCAL, ANICETO GARCIA. An American civil engineer, died on July 20th, 1908. He was born at Havana, Cuba, on Sept. 1st, 1839, and came to the United States when eighteen years old. In 1862 he graduated at the Rensselaer Polytechnic Institute at Troy, N. Y., after which he returned to Cuba and became assistant chief engineer of the Havana Waterworks. Upon returning to the United States he was, in 1870, made an engineer in the Department of Public Works of New York City, and two years later was appointed civil engineer in the United States Navy Department. While in the government employ he served as chief engineer on the surveys for determining the practicability of a ship canal

at Panama and Nicaragua, was chief engineer of the Maritime Canal Company of Nicaragua, and later prepared plans and cost estimates for a ship canal through Nicaragua. In 1879 he was appointed delegate to the Canal Congress, held in Paris. Here his services won for him the regard of President Grévy, who made him Chevalier of the Legion of Honor. In 1900 he was sent to the Philippines as a member of the board appointed to draw up plans for naval stations. He was one of the commission to choose a site and prepare plans for a coaling station on the coast of Liberia, and also made the plans for a drainage system for the northern part of Cuba.

MERCURY. The following table from *Mineral Resources, 1907*, of the U. S. Geological Survey, shows the production, in flasks of 75 pounds each, and the values for the United States in the year 1906 and 1907:

Production of quicksilver in the United States in 1906 and 1907, in flasks of 75 pounds.

State	1906		1907.	
	Quantity	Value	Quantity	Value
California	20,310	\$730,808	17,431	\$662,544
Oregon ..	3	109		
Texas	4,761	178,829	3,686	158,387
Utah	1,164	48,888	450	18,000
Total ..	26,238	\$958,634	21,567	\$828,031

In 1908 the American production was practically the same as in 1907, and the average monthly price per flask at San Francisco ranged from \$42.25 in September to \$45.12 in December, the average for the year being \$44.17, as compared with \$39.60 in 1907. The greater part of the quicksilver produced in the United States is for local consumption, there being but small shipments to Mexico and practically none to the Orient, where it must come into competition with the Spanish product. The most of the domestic production is now used for the manufacture of vermilion and for mirrors and scientific instruments, a small part being employed for amalgamating gold and silver ores. The world's production and value of quicksilver from 1903 to 1906, the last year for which figures were avail-

able in 1908, is given in the following table, published by the U. S. Geological Survey:

Country	1905		1906	
	Quantity	Value	Quantity	Value
United States ..	1,036	\$1,103,120	892	\$ 958,634
Austria	570	603,060	577	596,739
Italy	369	390,402	418	432,300
Russia	318	336,444	210	217,184
Spain	853	902,474	1,300	1,344,473
Total	3,146*	\$3,335,500	3,397*	\$3,549,330

* Mexico reported 190 tons in 1904 and 1905, and 200 tons in 1906.

MERRIAM, GREENLIEF A. An American naval officer, died at the Portsmouth Navy Yard Sept. 2d, 1908. He was born in Baltimore in 1850, and graduated from the United States Naval Academy in 1870. He was commissioned ensign in 1871, lieutenant in 1881, lieutenant commander in 1899, commander in 1901, and captain in 1906. At the time of his death he was in command of the navy yard at Portsmouth. He commanded the *Dixie* during the Spanish-American war, and the *Missouri* as far as San Francisco in the battleship cruise around the world in 1907-1908.

MERRILL, GEORGE EDMANDS. An American Baptist clergyman, president of Colgate University, died on June 11th, 1908. He was born at Charlestown, Mass., on December 19, 1846, graduated at Harvard in 1869, and at Newton Theological Institute in 1872. After receiving his degrees, he became pastor at Springfield, Mass., where he remained five years. From 1877 to 1885 he was pastor at Salem, Mass., and from 1885 to 1887 at Colorado Springs, Col. In 1890 he assumed the pastorate of the Immanuel Church in Newton, Mass., which he relinquished in 1899 to become president of Colgate University. He wrote several religious works, among which are: *The Story of the Manuscripts* (1881); *Crusaders and Captives* (1890); *The Reasonable Christ* (1893); *The Parchments of the Faith* (1895); and *The Songs of Solomon in the American Commentary on the Old Testament* (1905). Mr. Merrill received the degree of D. D. from Colby University in 1895 and that of LL. D. from the University of Rochester in 1901.

MERRIMAN, JOHN XAVIER. A South African politician, Premier of Cape Colony. He was born at Street, Somersetshire, Eng., in 1841; and educated at the Rondebosch Diocesan College. In 1849 he went to South Africa. He was Commissioner of Crown Lands from 1873 to 1878 and from 1881 to 1884; a member of the ministry from 1875 to 1878 and in 1881; and Treasurer-General from 1890 to 1893 and in 1898. In February, 1908, he succeeded Dr. Jameson as Premier.

MESEROLE, JEREMIAH VANDERBILT. An American soldier and banker, died at Far Rockaway, N. Y., on Aug. 13th, 1908. He was born in New York on Oct. 23d, 1833, became a surveyor and for many years was active in his profession in Brooklyn, retiring in 1891 to accept the presidency of the Williamsburg Savings Bank, a position he retained until his death. In 1855 he became a sergeant in the Seventh Regi-

ment, and he went to Washington with that command in 1861. When the Forty-seventh Regiment was organized in 1862, he became its colonel, and he served in that capacity until 1868. During the Civil War the regiment was several times called to the front and for a time helped to garrison Baltimore. He was made brigadier general in command of the Eleventh Brigade in 1868, and resigned from the National Guard in 1876.

MESSINA EARTHQUAKE. See EARTHQUAKES.

METCHNIKOFF, ILYA. A Russian embryologist and cytologist, was awarded (with Paul Ehrlich) the Nobel prize for medicine, in December, 1908. He was born in the province of Kharkov, on May 15th, 1842, and was educated there and at Giessen and Munich. He had the chair of zoölogy at Odessa in 1870-82 when he resigned to devote himself to private research. This has included investigation of the intracellular digestion of invertebrates, on which he published a very valuable memoir in 1884; and in the same year he enunciated the theory that inflammation in the vertebrates is caused by the conflict between the white corpuscles of the blood and the disease germs in it. In 1892 he became *chef-de-service* in Pasteur's Institute in Paris, and he succeeded to the direction of the institute upon the death of Pasteur in 1895. Some of his writings have been translated under the following titles: *Immunity in Infective Disease* (1905); *Nature of Man: Studies in Optimistic Philosophy* (1905); and *Prolongation of Life: Optimistic Studies* (1908).

METEOROLOGY. Professor Willis L. Moore, chief of the United States Weather Bureau, in his annual report for 1906-07, published in 1908, gave an account of some of the work accomplished at the Mount Weather Meteorological Observatory in Virginia. At this experimental station the study of the phenomena of the upper air was carried on by means of meteorological instruments which were sent up in kites to altitudes on the average from half a mile to two miles, and on several occasions over four and a half miles. In this way information regarding the vertical gradients of temperature and the direction of air currents at these altitudes has been gained, which has been of the greatest service in the making of forecasts for the Middle Atlantic and New England States. Heretofore forecasts of weather have been entirely based on the horizontal gradients of pressure and temperature measured near the surface of the earth. It is evident that, when a comparatively deep stratum of abnormally warm or cold air persistently overlies a region, a moving cyclone or anti-cyclone must influence the weather near the earth in a manner quite different from that in which it would influence it if the temperature of the upper air were normal. It was expected that researches of this character would lead to a radical improvement in the methods of making forecasts. Other problems, such as the investigation of the relation between the temperature changes which occur at high altitudes and those which occur near the surface, and the determination of the altitudes at which both the diurnal and annual variations of temperature cease, were indicated as likely to engage the attention of the staff of the station in the near future.

EVAPORATION AND THE SALTON SEA. Salton Basin, in the extreme southeastern part of Cali-

fornia, is a depression below the level of the sea, its lowest point being nearly 300 feet below mean tide. Several years ago, while a canal was being made from the Colorado river toward the Salton Basin for irrigation purposes, the water got out of control during time of flood, and for over a year the entire river discharged into the basin instead of the Gulf of California. After strenuous efforts the river was diverted to its proper channel, but there was left a lake or sea about 80 feet deep with a surface area of nearly 450 square miles, which is now known as the Salton Sea. It is well known that the rate of evaporation in any place depends on the temperature of the air and water, the dryness of the air, and the velocity of the wind, and other local conditions, but the exact nature of the dependence is not known. The important part which evaporation, equally with precipitation, plays in the economy of plant life renders the determination of the laws of evaporation on a large scale a matter of prime importance, especially in a country like the United States which has such vast agricultural interests. In the existence of a great body of water like the Salton Sea, with practically no outflow and a precipitation which can be accurately determined, the officials of the Weather Bureau see a splendid opportunity of clearing up this vexed question. It is an opportunity which is not likely to occur again very soon, for the sea will doubtless become a thing of the past in ten or fifteen years, and even before that time the salinity of its water will have increased to such an extent that the evaporation will no longer be normal and representative. Preliminary observations have already been made at the reservoir in Reno, Nev., with a view of determining the best method of attacking the problem, the solution of which will probably take several years.

THE ISOTHERMAL LAYER OF THE ATMOSPHERE. Reference was made in the YEAR BOOK for 1907 to the discovery by M. Teisserenc de Bort of the curious inversion of temperature which occurs at a height of from six to eight miles above the surface of the earth. At this altitude the air, the temperature of which has been steadily decreasing with increasing altitude, begins to get slightly warmer, or, at all events, the decrease of temperature goes on at a much diminished rate so that the air above this point may be considered as practically of uniform temperature. This layer of air is known as the "isothermal layer." In temperate Europe and America, it appears to begin at a height of about 35,000 feet; in the Arctic regions there are indications that it sinks as low as 23,000 feet, while at the equator Mr. A. L. Rotch failed to find it up to 56,000 feet; in fact, the paradoxical fact was established that in summer it is colder 8 miles above the equator than it is in winter at the same height in north temperate regions. It seems probable that the layer exists at the equator but at a height exceeding 50,000 feet, and that from this height it descends toward the poles in both hemispheres. Various explanations have been given to account for the existence of the layer, the most satisfactory being that it is the result of radiation, mainly from the mass water vapor in the lower strata of the atmosphere. Among the publications of the year may be noted *Climate. Considered Especially in Relation to Man*, by Prof. R. de C. Ward of Harvard University.

METHODIST EPISCOPAL CHURCH. A religious denomination, which took its beginning

from the great movement under the leadership of John Wesley, which was carried on in the middle of the eighteenth century. In the United States the first conference of the church was held in 1773, and an organization was brought about in 1785. In 1908 the total membership of the church was 3,376,888, of whom 3,028,815 were full members and 348,073 were probationers. The gain in 1908 over 1907 was 69,613, and the gain over the figures of 1900 was 448,005. The denomination had in 1908, 29,765 churches, valued at \$167,126,733, and 13,228 parsonages. At the close of 1907 there were 19,353 ministers, of whom 13,684 were serving as pastors. The total membership of the Sunday schools was 3,429,915, of whom 3,068,248 were scholars and 361,667 were officers and teachers. The Episcopal college, which includes the bishops of the denomination, consists of 32 members, 25 general superintendents, and 7 missionary bishops. The foreign membership of the church, which includes the communicants and probationers of its mission field, in 1908 was 305,322, an increase over the figures for 1907 of 22,887. Missions are carried on in nearly all the countries and divisions of the world. The total contributions for all causes for the year 1908 was \$44,268,781, of which about \$13,000,000 was for churches and parsonages; \$13,539,774 for ministerial support; \$3,582,753 for educational purposes; and \$3,532,769 for official benevolences. The latter includes missions, church extension, Sunday School Union, Tract Society, Freedmen's Aid, and American Bible Society. Foreign missions are carried on under the auspices of the Board of Foreign Missions of the Methodist Episcopal Church, which was organized on Jan. 1st, 1907, as the successor to what was known from 1819 to 1906 as the Missionary Society of the Methodist Episcopal Church. Important work is carried on by the church among the colored people of the South. In 1908 there were 1,823 pastors, traveling preachers, and supplies carrying on this work. The home missions of the church are administered by the Board of Home Missions and Church Extension. This Board in 1908 gave aid to 401 churches by donations amounting to \$133,777. The educational work, which includes the colleges under the auspices of the church, are carried on by the Board of Education. Other important bodies are the Board of Sunday Schools, Freedmen's Aid Society, the Women's Foreign Missionary Society, and the Bureau of Immigration Work. The nature of the duties of these bodies is sufficiently indicated by the titles. Under the direction of the church are 26 theological institutions, with an endowment of \$6,368,448, and a total membership of 1,392; 54 colleges and universities, with an endowment of \$20,186,768, and a total membership of 37,011; 46 classical seminaries, with an endowment of \$1,046,842, and a total membership of 9,930; 8 institutions exclusively for women, with an endowment of \$808,135, and a membership of 1,373; 55 foreign missionary schools, with an endowment of \$496,795, and a membership of 10,094; 4 missionary institutes and Bible training schools, with an endowment of \$106,000, and a membership of 487. The publications of the church are carried on by the Methodist Book Concern and by the Western Book Concern in the West. Among the official periodicals are the *Methodist Review*, bi-monthly, *World Wide Missions*, monthly, and the *Christian Advocate*, weekly. Periodicals are also issued in German.

The church lost during the year by death two bishops, Edward Gayer Andrews, and Charles Henry Fowler. Another notable loss occurred through the death of David Decamp Thompson, editor of the *Northwestern Christian Advocate*.

The 30th General Conference of the church met at Baltimore on May 23d. This meeting convened on the centennial anniversary of the first session of the General Conference in the same city. The sessions of the conference lasted during the entire month of May, and were attended by 787 delegates from all parts of the world. An Episcopal address, which was a review of the progress made by the denomination during the four years preceding, and also include recommendations in regard to ecclesiastical discipline and general conduct, was delivered by Bishop Daniel A. Goodsell of Boston. Many important matters were transacted during the session of the conference. Among the subjects which came up for discussion were the questions of the time limit upon the pastorate and forbidden amusements for church members. Bishop Goodsell in his Episcopal address recommended eliminating from the Book of Discipline the list of specified amusements inserted in 1872. Among the most significant incidents of the conference was the sending of a deputation to the Methodist Protestant General Conference then in session at Pittsburg with an invitation to the Methodist Protestant Church to reunite with the mother church. Dr. Thomas H. Lewis, President of the General Conference of the Methodist Protestant Church, attended the conference and delivered an address of remarkable strength and eloquence, favoring the reunion of the two churches. The six months' probation which has hitherto been required previous to admittance into full membership in the church was abolished, and the title Presiding Elder was changed to District Superintendent. Perhaps the most important work of the conference was the election of 8 new bishops. These were: William F. Anderson, John H. Nuelsen, William A. Quayle, Charles W. Smith, Wilson S. Lewis, Edwin Hughes, Robert McIntyre and Frank W. Bristol. A resolution was adopted requesting the bishops to appoint a commission, consisting of nine laymen, to compile statistics and gather information regarding the support of ministers. This Commission is to report at the General Conference of 1912. A resolution was also adopted favoring the holding of an Ecumenical Conference of all Methodism in 1911 upon the American continent. This conference is to include all Methodist denominations.

METHODIST EPISCOPAL CHURCH, SOUTH. A religious denomination, which was organized in 1845 as an independent division of the Methodist Episcopal Church, the separation being due to differing opinions on the question of slavery. In 1908 the church had 1,713,576 members, 7,188 traveling preachers, and 4,703 local preachers. There were 1,127,359 scholars in the Sunday schools, with 113,654 teachers. There were, under the church auspices 3,663 Epworth Leagues, with a membership of 127,924. There were received for foreign missions during the year \$381,180, and for domestic missions, \$268,080. The church extension receipts were \$120,243. The church has 15,816 buildings, valued at \$35,981,199. There are under the auspices of the church one university, 21 colleges, and 197 secondary institutions. The value of grounds and buildings is \$10,940,052, and the

endowment of university and colleges, \$4,155,704. The church increased in membership in 1908 by 55,042 new members, and in the number of Sunday school scholars, 43,121. The increase in the number of Epworth Leagues is 89, and in membership 4,233. Traveling preachers increased by 150 and local preachers decreased by 97. The Episcopal Board of Bishops consists of ten members. The church maintains a publishing house at Nashville, Tennessee. The principal publications are the *Methodist Quarterly Review* and the *Christian Advocate*.

METHODIST PROTESTANT CHURCH.

A religious body established in 1828 by members of the Methodist Episcopal Church who withdrew from that body on account of the refusal of the General Conference in 1824 to admit laymen. The church took its present name in 1830. It numbered in 1908 185,826 communicants, 2,390 churches, and 1,362 ministers. In 1907 a council was held with representatives of the Congregational House and the United Brethren for the purpose of negotiating for a union between the three bodies and an act of union was adopted, but at the National Council of Congregational Churches, it was voted to defer action, and this movement seems to have failed. At the General Conference of the Methodist Episcopal Church held in Baltimore in May, 1908, an overture for union with the Methodist Protestant Church was adopted, and commissioners were authorized to visit the General Conference of the Methodist Protestant Church, then in session at Pittsburg, Pa. The overture was favorably received, and a commission was appointed to meet similar commissioners from other Methodisms and if possible, present a plan for union at the next General Conference of the respective churches. It is hoped that the union will embrace the Methodist Episcopal Church, the Methodist Episcopal Church South, and the Methodist Protestant Church.

METROLOGY. See PHYSICS.

METROPOLITAN LIFE TOWER. See TALL BUILDINGS.

METROPOLITAN MUSEUM OF ART.

An institution incorporated under the laws of the State of New York in 1870 for the purpose of establishing a museum and library of art, and to encourage the application of the arts to manufactures and practical life. The museum has its collections in the handsome building in Central Park, which is owned by the city and leased to a corporation. Additions were completed in 1908 and others are under construction. In 1908 the total attendance at the Museum was 817,000, which is almost 17,000 greater than the attendance of the previous year. There were added to the collections 5,686 objects of art. Among the notable acquisitions during the year were the Hoentschel collection of Eighteenth Century French woodwork and furniture, the gift of J. Pierpont Morgan; a collection of laces numbering 967 pieces from Mrs. Magdalena Nuttall; sixteen modern paintings from Mrs. M. T. Fiske-Collord; William Morris Hunt's painting, "The Girl at the Fountain," from Miss Jane Hunt; Kenyon Cox's portrait of the late Augustus St. Gaudens, from a circle of the sculptor's friends; and the Rodin Group in Marble called "La Main de Dieu," from E. D. Adams.

Archæological work was carried on in Egypt during the year, and the result of these explorations will be found in the article ARCHÆOLOGY.

In addition to these a number of valuable acquisitions were purchased from the Egyptian government. These included several Egyptian tombs. The plan of special exhibitions under the auspices of the museum, which was initiated in 1908, will be continued in 1909. The cost of the administration of the museum in 1908 was \$260,396, of which the city contributed \$160,000, and the balance represented membership dues, subscriptions from trustees and the money received from admission fees. The director is Sir Caspar Purdon Clarke, and the president of the Board of Trustees, J. Pierpont Morgan.

MEXICO. A republic of North America. Area, including the islands, 767,258 square miles; population (1900), 13,607,259. Foreigners numbered 57,588 (15,266 Americans and 16,278 Spaniards). According to race, 19 per cent. were white, 38 per cent. uncivilized Indians, and 43 per cent. mixed. Roman Catholics numbered 12,380,245; Protestants, 51,795. The population of the principal cities in 1900 was: Mexico, the capital, 344,721; Guadalajara, 101,208; Puebla, 93,152; Leon, 63,263; Monterey, 62,266; San Luis Potosi, 61,019; Mérida, 43,630; Guanajuato, 41,486; Pachuca, 37,486; Morelia, 37,278; Aguascalientes, 35,052; Oaxaca, 35,049; Zacatecas, 32,856; Queretaro, 33,152; Orizaba, 32,849; Durango, 31,092; Chihuahua, 30,405; Vera Cruz, 29,164; Toluca, 25,940; Celaya, 25,565; Saltillo, 23,996; Colima, 20,698; Jalapa, 20,388.

EDUCATION. In 1904 there were 9,194 elementary schools supported by the federal government, the state, and the municipalities, with 620,476 pupils (237,969 girls). Schools for secondary instruction, supported by the federal and state governments, numbered 36, with 4,642 pupils (1,063 girls). Federal and state professional schools, of which 20 were normal, numbered 65, with 9,018 students (3,790 women). Private, clerical, and association schools, nearly all primary, numbered 2,281, with 135,838 pupils (61,982 girls). In 1907 there were 398 federal schools in the federal district, and 170 in the territories, with a total of 62,686 pupils. The National College of Agriculture and Veterinary Surgery was opened in 1907 with 240 students.

MINERALS. The production of gold in 1906-7 amounted to 36,563,898 pesos (1 peso = 49.8 cents); of silver, 77,088,827 pesos. There are over 1,000 copper mines, the two principal copper mining camps being at Cananea (Sonora), and Boleo (Lower California). The copper production in 1907 was 61,127 metric tons, and the lead production, 72,000 tons. The production of these two metals declined during the year, while that of zinc and antimony increased. The known coal-bearing fields are in the states of Puebla, Oaxaca, and Coahuila. The principal coalfields now being exploited are in the neighborhood of Sabinas, in Coahuila, and are similar to those of Texas. The coal mined in this district is used in the smelters of Monterey, Saltillo, Torreón, etc., as well as by the railways. The petroleum-bearing lands extend from central Tamaulipas to the district of Valles in San Luis Potosi (where the Ebano oil deposits are being worked) and into Vera Cruz. Another field extends further to the south from Vera Cruz through Tabasco, Campeche, and Chiapas. In small quantities petroleum has also been found in the Federal District, Jalisco, and Oaxaca. The Ebano oil is used as fuel for locomotives. Messrs. Pearson and Sons, an English corporation, have ob-

tained concessions of 1,000,000 acres of oil-bearing lands and have erected a large refinery at Minatitlán. There are also large refineries, owned by Americans, at Tampico, Vera Cruz, etc. Asphalt is chiefly produced in the Tuxpam and Tampico districts, on the Gulf of Mexico. The Tampico product is chiefly the residue from the Ebano works, 40 miles to the west. The Minatitlán works also ship asphalt.

The principal iron deposits are in Colima, where there are, within a radius of 30 miles, deposits which show at least 60 per cent. of iron with a low percentage of phosphorus and are estimated to contain 60,000,000 tons of iron; in Michoacan, where the Progreso deposit measures over 28,000,000 tons of a superior grade of iron; in Guerrero, near the mouth of the Balsas River, from 220,000,000 to 260,000,000 tons of 63 per cent. iron; besides minor deposits of from 1,000,000 to 20,000,000 tons. The village of Cuyatlán, situated on the sea-coast some 20 miles southeast of Manzanillo, is the centre of the salt industry in the State of Colima. The annual output is about 110,000 tons. Concessions have been granted for working the guano deposits on the Arcas and Arenas islands, in the Gulf of Mexico.

AGRICULTURE. The principal agricultural products are wheat (about 10,000,000 bushels in 1907), maize (70,000,000 bushels in 1906), rice (62,000,000 bushels in 1906), sugar cane, henequen, cotton, coffee, cacao, and tobacco. The wine production for 1907 was 500,000 gallons. The production of sugar for 1907-8 was estimated at 115,000 tons. Morelos is the centre of the sugar industry, followed by Vera Cruz, Puebla, Michoacan, and Jalisco. The output of molasses in 1906-7 was over 68,000 tons. The area under cotton in 1907 was about 300,000 acres, and the production, about 85,000 bales of 500 pounds each—a large reduction from the previous year. The coffee production for 1907-8 was estimated at 92,000,000 pounds, against 33,000,000 in 1906-7. The Mexicans expect a great future for this industry; for 1908-9 the estimate is 81,000,000 pounds. Yucatan is the home of the henequen or sisal fibre, which is grown in no other section of the republic. It covers about 100,000 acres, and its export from the port of Progreso in 1907 amounted to 611,845 bales, weighing 100,773,004 kilos (1 kilo = 2.15 pounds), and valued at 24,874,317 pesos. Of the above total, the United States took 552,072 bales; Canada, 44,269; Cuba, 7,787; and Europe, 7,710. In 1908 the henequen planters suffered from the financial depression, and the National Bank advanced them loans to the amount of 2,000,000 pesos. Another measure in aid of the planters was the abolition of the export duty on henequen in April, 1908. Guayule rubber is an important article of export. It is said that the known supply will be exhausted within seven years, and government experts have announced the discovery of *palo amarillo*, or *palo colorado*, as a plant which is superior to guayule. The latter yields about 8 per cent. of rubber and no by-products, while the former is stated to yield 10 per cent. of rubber and 40 per cent. of varnish and soap material. A company has been formed at New York with a large capital to exploit the new discovery.

In 1908 a law was passed, subsidizing irrigation works and providing for the establishment of banks making loans at easy rates of interest to agriculturists and manufacturers. In pursu-

ance of this law, a bank was established, the "Caja de Prestamos para Obras de Irrigacion y Fomento de la Agricultura, S. A.," the capital to which was subscribed by the four leading banks of Mexico City. The new bank issued bonds to the value of \$20,000,000 gold, guaranteed as to principal and interest by the Mexican government.

CATTLE-RAISING. In 1902 there were in Mexico 5,142,457 cattle, 859,217 horses, 334,435 mules, 287,991 asses, 3,424,430 sheep, 4,206,011 goats, and 616,139 pigs. Within the last few years there has been a decided improvement in the care taken of animals and also in the imports of animals, many pure-bred cattle having been introduced from the United States. There are numerous and extensive haciendas admirably adapted and almost exclusively devoted to the rearing of cattle. Stockmen from the American west and middle west, where the larger ranches are being gradually cut up for agricultural purposes, are now turning their attention to the grazing lands of Mexico, which are estimated at about 120,000,000 acres. The exports of hides and skins increased from 18,866,371 pounds in 1903-4 to 23,811,435 pounds in 1905-6.

MANUFACTURES. Among the manufacturing industries the cotton industry is the most important. In 1905 there were 128 cotton factories (in 1906, 125), employing 30,162 persons, 678,058 spindles, and 22,021 looms, and consuming 68,850,195 pounds of cotton during the year. There has been no notable expansion of the industry since then; for 1907-8 the number of spindles was estimated at 730,000, and the consumption of cotton at 175,000 bales. At Monterey there is a steel plant turning out rails, structural steel, etc., with a capital of 10,000,000 pesos. In 1908 it received an order from the National Railways of Mexico for 20,000 tons of steel rails. Other iron works exist at Chihuahua, Durango, Pachuca, Aguascalientes, Mexico City, etc. The Mexican National Packing Company, the capitalization of which was increased in 1907 to \$15,000,000 pesos, has packing plants in Uruapan (Michoacan) and Mexico City, with a joint capacity of 1,100 beeves a day, and in 1908 it proposed to build packing plants at Vera Cruz and Monterey, the four to have a capacity of from 2,500 to 3,000 head a day. The capital is mainly British, although an American is at the head of the company. In 1907 there were 995 tobacco factories, which produced 325,259,735 packages of cigarettes, 134,055,669 cigars, 164,308 kilos of smoking tobacco, and 27,800 kilos of snuff. The Indians are experts in the manufacture of pottery by hand. Guernavaca, Guadalajara, Puebla, and Oaxaca are the principal centres of this industry, but it is met with in many of the smaller towns and villages throughout the country.

FOREIGN COMMERCE. The imports and exports of Mexico during the fiscal year 1907-8 amounted to 221,535,993 and 242,738,907 pesos, respectively, against 232,229,579 and 248,018,010 pesos, respectively, in 1906-7. The imports, by classes, in 1907-8 were as follows, in pesos: Animals and animal products, 17,263,792; vegetable products, 30,631,463; mineral substances, 69,517,707; textiles, 30,575,815; chemicals and drugs, 10,350,906; beverages and liquors, 7,163,930; paper, 6,146,866; machinery, 28,673,001; vehicles, 7,387,089; arms and explosives, 3,650,314; miscellaneous, 10,175,110. The mineral substances included iron and steel construction and industrial

materials, worth 23,409,923 pesos, and iron and steel manufactures, valued at 7,248,458. The textiles included cotton yarns and fabrics, valued at 17,628,193 pesos. The exports, by classes, in 1907-8, were as follows, in pesos: Minerals, 158,430,625 (including gold, 31,921,019; silver, 93,034,751; copper, 24,834,068; antimony, 1,691,187; lead, 5,344,562; besides marble, plumbago, zinc, etc.); vegetable substances, 70,185,983 (including uncleaned cotton, 10,592,486; guayule, 1,232,634; rubber, 8,891,681; chicle, 2,251,625; peas, 3,418,259; henequen, 27,019,340; ixtle, 2,900,728; leaf tobacco, 2,637,742; broom root, 2,347,699; vanilla, 1,911,061; woods, 2,189,718; besides dyewoods, sarsaparilla, beans, oil of aloes, etc.); animals and animal products, 9,659,789 (including undressed hides, 6,798,425); manufactures, 3,014,029, including sugar, flour, straw hats, manufactured tobacco, etc. The trade with the principal countries of origin and destination in 1907-8 was as follows, in pesos:

From and to	Imports	Exports
United States	117,235,185	170,125,337
Great Britain	32,870,327	26,256,848
Germany	28,397,662	22,359,372
France	19,986,727	12,393,816
Spain	7,609,925	2,331,048
Belgium.....	3,237,551	6,029,537

SHIPPING AND NAVIGATION. In 1907 the Mexican merchant marine (excluding vessels of less than 100 tons) consisted of 44 steamers, of 16,206 net tons, and 18 sailing vessels, of 4,021 net tons. In 1906-7 in the foreign trade there entered 1,697 vessels of 3,282,125 tons, and cleared 1,669 vessels of 3,257,932 tons.

INTERNAL COMMUNICATIONS. In 1907 the total length of railways was 14,172 miles, of which the federal government owned 11,418 miles. Included in the government railways is the Tehuantepec Railway, from Coatzacoalcos, on the Gulf of Mexico, to Salina Cruz, on the Pacific, 189 miles long. A regular steamship service between New York, and Honolulu via the Tehuantepec Railway is being operated by the American-Hawaiian Steamship Company. The first really transcontinental railway in Mexico was completed in 1908. It runs from Tampico, on the Gulf of Mexico, to Manzanillo, on the Pacific, 1,031 miles. It is intended to shorten the route to some 800 miles by building a cut-off between Guadalajara and Aguascalientes. Another important line completed in 1908 was the railway from San Jeronimo, on the Tehuantepec Railway, to Tapachula, in the State of Chiapas, on the Guatemalan frontier—an important link in the proposed Pan-American line.

In 1908 the Mexican Central Railway was merged with the National Railways of Mexico, the government obtaining a controlling interest in the former, as well as in the latter. Towards the end of 1908 the Mexican Central line from Guadalajara reached the Pacific port of Manzanillo, about 220 miles distant. The engineering difficulties were so great that the construction of this line had to be spread over many years. In 90 miles the line rises from sea-level to an altitude of nearly 5,000 feet, crossing many rivers and gorges in its course. An even greater project is being carried out by the Southern Pacific Railroad, of the Harriman system, which is building

a line to connect Guadalajara directly with the United States. The total distance from Nogales, Arizona, to Guadalajara is 1,114 miles. In the middle of 1908 Nogales was connected by rail with Guaymas, 260 miles distant, and work was progressing between Culiacan and the Fuerte River, while the route was graded for several miles north and south of the port of Mazatlan. Tequila was to be reached by Nov. 1st. The total cost of the line is estimated at \$25,000,000, the Mexican government granting a subsidy of 12,500 pesos for each kilometer completed. Exceptional difficulties have had to be overcome, and for a distance of some 20 miles the cost will be as high as \$100,000 per kilometer. The important points on this Mexican extension of the Southern Pacific will be as follows: Guaymas (30,000 population), the seaport of the State of Sonora, 260 miles from Nogales; Alamos (10,000 population), an important mining centre in Sonora, 173 miles from Guaymas; Culiacan (14,403 population), capital of Sinaloa state, 288 miles from Alamos; Mazatlan (16,000 population), an important seaport of Sinaloa, 155 miles from Culiacan; Santiago Ixcuintla (8,500 population), a town in the Territory of Tepic, 148 miles from Mazatlan; Tepic (15,488 population), capital of Tepic territory, 43 miles from Santiago Ixcuintla, and 169 miles from Guadalajara.

The length of government telegraph lines in 1908 was 38,527 miles, and of government cable lines, 481 miles. There are also about 3,000 miles of telegraph line belonging to the states and private companies.

The Mexican government is constructing a canal, 104 miles long, to connect the ports of Tampico and Tuxpam. The canal is to run within from two to five miles of the Gulf along its whole length, its main purpose being to facilitate coast traffic. It is to be completed by 1910.

BANKS. On Dec. 31st, 1907, there were 34 chartered banks, of which 29 were banks of issue. The largest of these is the National Bank of Mexico, with assets and liabilities on the above date of 302,317,856 pesos. The total capital of the banks was 171,600,000 pesos; reserves, 59,736,197; certificates in circulation, 91,475,982; loans, 145,692,875; total assets and liabilities, 760,748,651. During the recent monetary stringency the Mexican banks continued to meet their obligations in cash, but the rate of interest was advanced to 12 per cent., an increase of 2 1-2 per cent. from July, 1907. Concerning the new Agricultural and Irrigation Bank see above, *Agriculture*.

FINANCE AND MONEY. In 1906-7 the ordinary revenue amounted to 114,286,122 pesos, and the ordinary expenditure to 85,076,641 pesos. The budget for 1908-9 estimated the revenue at 103,380,000, and the expenditure at 103,203,000 pesos. The principal estimates of revenue were, in pesos: Customs, 49,595,000; direct taxes, 32,030,000; excise taxes, 6,250,000; mining taxes, 4,340,000; lottery, 4,130,000; posts and telegraphs, 6,325,000. The principal estimates of expenditure were, in pesos: Public debt, 26,201,870; justice, 15,837,500; public instruction, 6,902,500; communications, 8,648,300; war and marine, 20,466,700; posts and telegraphs, 7,910,370. The public debt stood on June 30th, 1907, at 444,530,710 pesos, consisting of a consolidated gold debt of 310,515,580 pesos, a consolidated sil-

ver debt of 133,291,000 pesos, and a floating debt of 724,130 pesos.

The monetary unit is the silver peso or dollar, the legal value of which has been fixed at 75 centigrams pure gold (=49.8 cents). The total coinage from May 1st, 1905, to June 30th, 1908, amounted to 59,782,590 pesos, consisting of 40,813,250 pesos gold (10-peso and 5-peso pieces), 18,100,272 pesos silver (pesos, and 50, 20, and 10-centavo pieces), 400,864 pesos nickel (5-centavo pieces), and 468,204 pesos copper (2 and 1-centavo pieces). The fractional silver and copper coins of the old issue retired from circulation from May 1st, 1905, to June 30th, 1908, amounted to 5,137,224 and 125,576 pesos, respectively. The bank-notes are rigidly secured by the charters under which the banks of issue operate.

ARMY AND NAVY. The army is recruited by voluntary enlistment, supplemented by a form of conscription which applies only to the poorest classes of the population. Universal compulsory military service was a part of the last reorganization scheme, but had to be abandoned on account of the extensive opposition it provoked. The army consists of 28 battalions of infantry; 14 regiments of cavalry; 2 regiments of field, 1 of horse, and 1 of mountain artillery; 1 battalion and 3 sections garrison artillery, and 1 machine gun company. The peace strength of the army is about 26,500, and the nominal war strength about 82,500, of all grades. The navy consisted in 1908 of one unprotected small cruiser, 1,220 tons, and 8 gunboats of 6,240 tons, with about 1,200 officers and men.

GOVERNMENT. The republic consists of 27 states, two territories, and a federal district. President Porfirio Diaz's seventh term commenced on Nov. 1st, 1904. The Vice-President is Ramon Corral. The cabinet at the end of 1908 was as follows: Interior, the Vice-President; Foreign Affairs, Ignacio Mariscal; Finance, José I. Limantour; Justice, J. Fernandez; Public Instruction, Justo Sierra; Fomento, Olegario Molina; Communications and Public Works, Leandro Fernandez; War and Marine, M. Gonzalez Cosio; Treasurer, J. Arrangoiz.

HISTORY. The year on the whole was one of prosperity and peace. In the summer, however, there was trouble with the Yaqui Indians and with small bands of Mexican insurgents. The Yaquis committed a number of raids toward the end of June, and on July 1st it was announced that 200 of them had been captured by the federal troops in the mountains of Sonora. On Dec. 29th the long war with the Yaquis was terminated by a treaty of peace agreed upon by the Governor of Sonora and three Indian chiefs and 166 of their followers. On June 25th insurgents raided Viesca in the province of Coahuila and looted the town. The government acted with promptness and a number of the rebels were captured. At about the same time rebels threatened the town of Torreon and were active in the vicinity of Ciudad Porfirio Diaz. On June 26th there was an engagement near Las Vacas in which several of the insurgents were killed. Federal troops were hurried to the disaffected regions. The government declared that agitators on the United States side of the frontier were causing the trouble, and the United States War Department ordered troops to the border to enforce neutrality. A fight was reported at the end of July a few miles across the Rio Grande from Comstock, Texas,

resulting in slight losses to both sides. On May 28th a treaty of amity and commerce was signed with Honduras. Ratifications of the arbitration treaty with the United States were exchanged June 27th. On June 19th a new banking law was enacted and in August a revision of the tariff was made. Congress met on September 17th, and in the President's address, approval was expressed of the attitude of the United States toward neutrality and of the Central American Court of Justice, and reference was made to the steps taken to broaden the system of education and to the establishment of a bacteriological institute and a board of forestry, harbor improvements, and irrigation. In March a serious earthquake, causing great loss of life and property, was reported in the eastern part of the state of Guerrero. During the summer the English press in the city of Mexico reported the prevalence of bitter anti-American sentiment throughout the country. Measures directed against foreign merchants and landowners were introduced into Congress. One probable cause was the belief that the United States government permitted the opponents of the Diaz régime to carry on their active agitation from American soil.

MICHIGAN. One of the North Central Division of the United States. Its total area is 57,980 square miles. The population, according to a federal estimate in 1908, was 2,639,050.

MINERAL PRODUCTION. The mineral resources of the State are remarkable for both extent and progress of development. Both the iron and the copper mines rank among the most productive of the country. Of the iron ore produced in the United States the mines of the Lake Superior region furnish about 70 per cent., while the copper mines of Michigan furnish about 14 per cent. of the copper produced. In 1907 the Michigan copper mines, unlike the copper mines in other sections of the country, were operated in most instances at full capacity, and had a successful year. The production of copper obtained for the calendar year 1907 was, according to statistics furnished by the Commissioner of Mineral Statistics, 220,217,892 pounds, as compared with 224,407,859 pounds for 1906, and 217,762,382 pounds for 1905. The amount of copper produced and dividends paid in 1907 was exceeded only since the mining of copper began in the State by 1906, and but for the financial stringency and business depression occurring during the later months of the year, it is probable that the year would have seen a larger production of copper than ever before recorded. Copper sold for much better than average prices and the mines which worked at full capacity sold their products without difficulty. The iron mines of the Lake Superior region are worked harder and more vigorously than are the mines of any other district in the world, and the results accomplished are not surpassed anywhere on the globe. The three years 1905, 1906, and 1907 formed a remarkable period in iron-mining in this region. The quantity of iron mined in the three years included in this period is as follows: 1905, 34,242,065 tons; 1906, 38,522,239 tons; 1907, 42,245,076 tons. The record year previous to 1905 was 1903, when the shipments amounted to 27,571,121 tons of ore. The production by ranges in 1907 was as follows, by tons; Menominee (partly in Wisconsin), 4,964,728; Marquette, 4,388,073; Gogebic (partly in Wisconsin), 3,637,907. During 1907 ore was forwarded to furnaces from 190 mines in the Lake Superior mining region, and

three-fourths of all the ore produced was of Bessemer grade. Salt is produced in large quantities in Michigan, and the number of barrels produced in 1907 was larger than any previous season. The output for the year was 6,298,463 barrels, as compared with 5,644,559 in 1905. The Michigan product is about one-fourth the total production of the United States. Since the establishment of the industry in the State the total output has been 129,330,998 barrels. The total annual producing capacity of the State is about 10,000,000 barrels, and not much more than 60 per cent. of this was utilized in 1907 and 1908. The coal-mining industry of Michigan is very considerable and the production in 1907 surpassed all previous records. In that year there were produced 1,931,011 tons, as against 1,424,427 tons in 1906. Much development work is going on in the coal region and the industry is destined to expand greatly. In the production of Portland cement Michigan ranks with the most important States. In 1907 there were manufactured 3,558,727 barrels, a slight falling off from the figures of 1906, which were 3,923,115 barrels. This decrease resulted from the car famine and the money stringency, which cut off the demand for cement much earlier than usual and necessitated the shutting down of many plants. The number of men employed in the industry in 1907 was 1,807. Among other minerals produced in the State were graphite, with a production of about 600 tons of graphite ore, equivalent to about 1,000,000 pounds of refined graphite; and gypsum, which is found in several parts of the State. Gold exists in Michigan, but has not yet been mined with profit. Other minerals found in the State are silver, salt, asbestos, marble, and sandstone. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$70,073,920, as compared with a value in 1906 of \$104,424,548. The production of copper in 1908 was 221,500,000 pounds, a slight gain over the production of 1907. It was estimated that the coal production of the State in 1908 would show a decrease of 25 to 35 per cent.

AGRICULTURE AND STOCK RAISING. The acreage, production, and value of the principal crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 60,420,000 bushels, valued at \$38,669,000, from 1,900,000 acres; winter wheat, 15,732,000 bushels, valued at \$15,260,000, from 874,000 acres; oats, 41,847,000 bushels, valued at \$20,505,000, from 1,409,000 acres; barley, 1,785,000 bushels, valued at \$1,107,000 from 70,000 acres; rye, 5,704,000 bushels, valued at \$4,050,000, from 368,000 acres; buckwheat, 742,000 bushels, valued at \$527,000, from 55,000 acres; potatoes, 23,400,000 bushels, valued at \$13,572,000, from 325,000 acres; hay, 3,954,000 tons, valued at \$34,598,000, from 2,727,000 acres. The production of wheat showed a considerable increase over 1907, when it was 10,500,000 bushels. Wheat acreage has decreased nearly 50 per cent. from that of 1900. The oat crop of 1908 showed a noticeable increase over that of 1907, which was 27,679,520 bushels. The production of potatoes showed a slight decrease, the figures in 1907 being 27,251,224 bushels. The State ranks first in the acreage and production of rye, surpassing in 1908 Pennsylvania, which previously had held first rank. Michigan is among the first States

in the acreage and production of sugar beets. The output of beet sugar in 1908-9 was estimated at 76,900 tons. The fruit and vegetables also rank among the leading agricultural products in the State. The number of farm animals on Jan. 1st, 1909, were as follows: Horses, 739,000; mules, 4,000; dairy cows, 891,000; other cattle, 993,000; sheep, 2,130,000; swine, 1,332,000. All classes except swine show an increase since 1900. The wool clipped in 1908 was valued at \$2,208,000.

MANUFACTURES. The census of 1904 reported 7,446 establishments classed as factories, with \$337,894,000 capital, 175,229 wage-earners, and \$429,120,060 worth of products, these figures being respectively 1.9, 36.8, 12.5, and 34.2 per cent. larger than in 1900. Of the wage-earners 24,270 were women and 3,283 were children under 16. The value of products of leading industries, and, in parentheses, the per cent. of increase over 1900, were: Lumber and timber products \$40,569,335 (24.8 per cent. decrease); foundry and machine shop products, \$31,291,195 (51.8); flour and grist mill products, \$26,512,027 (22.5); copper smelting, \$21,222,217 (22.4); furniture, \$18,421,735 (26.1); planing mills, \$14,375,467 (15.3); steam railroad cars, \$13,467,751 (35.8); carriages and wagons, \$12,101,170 (8.8); printing and publishing, \$10,892,967 (45.5); chemicals, \$9,775,704 (83.6); leather, \$9,340,349 (55.3); druggists' preparations, \$8,797,911 (78.7); agricultural implements, \$8,719,719 (37.5); and cheese, butter, and condensed milk, \$8,208,706 (109.5). Somewhat less valuable were cigars and cigarettes, iron and steel, paper and wood pulp, food preparations, and beet sugar. (See above, *Agriculture*, for beet sugar.) In spite of the great decrease in the value of lumber products, only Washington and Wisconsin reported larger values. The value credited to white pine was \$8,870,229, about one-half its value in 1900. The value of hemlock was \$8,810,920, and of maple, \$4,827,806. The State leads in druggists' preparations, and in 1904 ranked third in furniture, and fourth in copper smelting. Values attributed to principal centres were: Grand Rapids, \$31,032,589; Kalamazoo, \$13,141,767; Saginaw, \$10,403,508; Jackson, \$8,348,125; Lansing, \$6,887,415; Muskegon, \$6,319,441; and Flint, \$6,117,170.

FINANCES. The Report of the Treasurer for the fiscal year ending July 1st, 1908, showed that there remained a balance on hand July 1, 1907, of \$6,788,867.06. The receipts for the fiscal year ending June 30th, 1908, were \$11,058,072.78. The disbursements were \$14,837,193.10, leaving a balance on hand June 30th, 1908, of \$3,009,746.74. Of this sum, little more than one-half, \$1,550,124.93, was available for general purposes. Over \$1,000,000 belonged to the primary school fund, and nearly \$400,000 were assets of insolvent financial institutions being held in trust by the State Treasurer. The school trust funds of the State amounted, in 1908, to \$6,833,566.49. The chief sources of revenue were as follows: From county treasurers, \$5,121,827.27; from taxes, express and railroad companies, \$3,549,328.89; from fees, licenses, etc., \$142,845.39. The tax paid by the railroad companies in the State during the year amounted to \$3,499,367.27. The school moneys apportioned in the State amounted to \$3,739,155.

CHARITIES AND CORRECTIONS. The most important act in the legislative session of 1907 in relation to charities and corrections in the State was the enactment of the juvenile court law

after the invalidation of two previous acts along kindred lines. A juvenile court division of the Probate Court was established instead of a new court as in the previous acts. (See *JUVENILE COURTS*.) Among the State institutions are asylums for the insane at Kalamazoo, Pontiac, Traverse City, Newberry, and Ionia, and the Wayne County Asylum at Eloise; the Home for Feeble-minded and Epileptic at Lapeer; the State Public School at Coldwater; the School for the Deaf at Flint; School for the Blind at Lansing; Employment Institution for the Blind at Saginaw; Soldiers' Home at Grand Rapids; Industrial School for Girls at Adrian; Industrial School for Boys at Lansing; Michigan Reformatory at Ionia; Upper Peninsula Prison at Marquette; and the State Prison at Jackson. The aggregate appropriation for all these institutions per year is about \$2,000,000.

POLITICS AND GOVERNMENT. There was no meeting of the State legislature in 1908. On Jan. 22d a convention October completed its session since the previous October completed its work of constructing a new State constitution to supersede the constitution of 1850. The new constitution was ratified by the electors in November by a vote of 244,705 for, and 130,783 against. In March a grand jury in the county where Lansing, the State capital, is located indicted the State treasurer, Frank P. Glaizer, on a charge of misappropriating \$685,000 of State funds. His trial was not begun until late in December, and it went over into the new year. The same grand jury indicted probate judge John W. Dunn, of Arenac county, and city controller C. J. Barnett, of Bay City, on the charge of attempting to bribe a member of the legislature on the eve of the election of a United States senator. Also Representative Archibald F. Bunting and Jeremiah H. Anderson were indicted by the same grand jury, charged with irregularity in connection with expense accounts turned into the State during the legislative session of 1907. The prohibition area of the State was materially increased at the April election when 10 of 14 counties in which the question of license or no-license was submitted voted no license. Several cities in other counties also voted "dry." On April 8th Judge Knappen, of the United States court for the western district of Michigan, imposed a fine of \$20,000 on the Stearns Salt and Lumber Company of Ludington for accepting rebates from the Père Marquette Railroad on lumber shipments. Later the fine was reduced to \$10,000, which the company paid.

CONVENTIONS AND ELECTIONS. The Republican State convention met at Grand Rapids for the selection of delegates to the national convention. Delegates at large were instructed for William H. Taft for President. The Democratic State convention met at Lansing on May 20th. Although there had been shown a considerable sentiment throughout the State in favor of the nomination of Governor John A. Johnson of Minnesota, for President, it was not enough to be effective in the convention. Several counties sent delegates favorable to Johnson, but on the resolution to instruct delegates to vote for William J. Bryan there were no dissenting votes. To make this action still more binding the unit rule was adopted. Republican primaries for the nomination of candidates for governor and lieutenant governor were held Sept. 1st. The contestants for the gubernatorial nomination were Governor Fred M. Warner, who sought a third

term, Auditor General James B. Bradley, and State Good Roads Commissioner Horatio S. Earle. Warner was nominated, receiving 87,719 to 86,440 for Bradley, and 26,752 for Earle. The returns were contested by Bradley, but, following a ruling of the supreme court that the State Board of Canvassers could not go behind the election returns, he withdrew from the contest on Oct. 9th. There was no contest for the Republican nomination for lieutenant governor. Lawton T. Hemans was the Democratic nominee for governor.

The election on November 3d was remarkable for the disparity between the plurality received by Mr. Taft and that received by Governor Warner. The Republicans carried the State for Mr. Taft by over 160,000, while Governor Warner defeated Mr. Hemans by a vote of about 10,000. Every large city in the lower part of the State gave Hemans majorities with the single exception of Detroit. The detailed vote of the State for national and State ticket was as follows: Taft, 335,580; Bryan, 175,771; Chafin, 16,974; Debs, 11,586; Warner, 262,141; Hemans, 252,611.

OTHER EVENTS. On April 28th nine persons were killed and a score injured by a collision on the Detroit, Jackson & Chicago electric railway near Ann Arbor. The most destructive forest fires in years visited the State during September and October. Great loss of property occurred in the northeastern section of the Lower Peninsula and in parts of the Upper Peninsula. On Oct. 16th, seventeen persons, mostly women and children, were burned to death while trying to escape in a coal car from the burning village of Metz, in the Upper Lake Huron district. The heat caused the rails to spread, leaving the relief train stalled with woods on fire on all sides. Several other persons in other sections lost their lives by forest fires.

STATE OFFICERS: Governor, Fred M. Warner; Lieutenant-Governor, P. H. Kelley; Secretary of State, Fred'k C. Martindale; Treasurer, Al. E. Sleeper; Auditor, Oramell B. Fuller; Attorney-General, John E. Bird; Adjutant-General, William T. McGurrin; Superintendent of Education, Luther L. Wright; Commissioner of Insurance, James V. Barry; Commissioner of State Land Office, Huntley Russell—all Republicans.

JUDICIARY—Supreme Court: Chief Justice, Claudius B. Grant; Justices, William L. Carpenter, Rep.; Joseph D. Moore, Rep.; Aaron V. McAlvay, Rep.; R. M. Montgomery, Rep.; Frank A. Hooker; Charles A. Blair; Russell C. Osterlander; Clerk, Charles C. Hopkins, Rep.

The State legislature of 1909 is composed of 32 Republicans in the Senate and 98 Republicans and 2 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES, under the section *Congress*.

MICHIGAN, UNIVERSITY OF. An institution of higher learning at Ann Arbor, Michigan, founded in 1837. In 1907-8 the attendance was 5,010, distributed as follows: Literature, science, and the arts, 1,795; engineering, 1,353; law, 791; medicine, 472; dentistry, 168; pharmacy, 101; summer session, 1,070. Fifty per cent. of these students came from Michigan; the remainder, representing every other State and Territory in the Union, and 22 foreign countries. In the autumn of 1908, the total registration was 4,656, to which should be added the registration of the summer school of 1908 of 551, making a total enrollment on Nov. 15th, 1908, of 5,207. The total number of women enrolled is about 725.

The total income of the university for 1907-8 was about \$1,104,000, of which about \$650,000 came from the State. The total number of instructors is about 410. During 1907-8, a new dental building was completed at a cost of \$125,000, and a memorial hall, largely the gift of the alumni, was nearing completion at the close of the year. An addition was made to the observatory of a new 40-foot dome, with a large new reflecting telescope. A chemical laboratory to cost \$250,000, and an addition to the main building of the engineering department to cost \$75,000, were in process of construction during 1908. The university has acquired a tract of about 90 acres of land in Ann Arbor to serve as a botanical garden and arboretum. A woman's athletic field of 7 acres has also been secured. About 1,500 acres of land, to be called the *Bogardus Engineering Camp* for its donors, have come to the university. This will serve as a summer engineering camp and probably will be developed into a geological station of importance. The library contained June 30th, 1908, 241,128 volumes.

MILITARY BALLOONING. See AERONAUTICS and MILITARY PROGRESS.

MILITARY PROGRESS. The year 1908 was not marked by any active military operations of importance in any part of the world, although the region of the Bosphorus threatened at one time to become a theatre of war and the colonial troops of most countries continued operations of a more or less serious nature against hostile tribes. The year was also devoid of any radical changes in personnel or startling developments of war material, being in this respect, like the two or three preceding years, devoted rather to the digestion and application of the lessons of recent wars. Each important military nation had worked out these lessons for itself, demonstrated the deductions on the manœuvre-ground, and was quietly adapting the military policy of the nation to the new conditions.

The lines along which the greatest activity occurred in 1908 may be briefly indicated, for the different branches of the service, as follows:

INFANTRY. A great deal of attention was given to increasing the efficiency of the individual soldier by various means. In two or three of the principal armies of the world the pay and rations of enlisted men were increased, notably in Italy, France, Russia, and the United States. Nearly all countries conducted experiments with a view to lightening the pack carried by foot-soldiers, the most radical departure from previous practice being that of Great Britain, where the pack was divided into two distinct parts, one for fighting only, and the other an additional pack to be carried on the march, and left behind when going into battle.

MACHINE GUNS. Machine guns continued and even increased in favor, so that they were an important part of all mobile armies, being attached to mounted, as well as to dismounted troops. These guns have a narrow cone of dispersion and produce a powerful but highly concentrated effect. They find their logical employment, especially in mountains, against narrow fronts and defiles. They do not lend themselves to long, drawn-out action, principally because they heat too readily and use too much ammunition, which latter is all the more regrettable because the supply is so difficult. They should not be engaged for any length of time in

frontal action. Only exceptional circumstances warrant this, and then only for flanking purposes and under cover. There are many different types of these guns, of which the most popular is the Maxim, adopted by most countries, and the simplest, the Schwarzlose, which has only twelve pieces in its breach mechanism as against forty-nine pieces for the Maxim and thirty-five pieces for the Hotchkiss.

SMALL ARMS. Experiments were continued with automatic rifles in the endeavor to overcome the weight, the time required to go into action, and the prominence of the gun as a target. The new sharp-pointed bullet, known as the model 1906 in the United States, the S bullet in Germany, and the D bullet in France, amply proved its superiority and was adopted in several other countries, among them being Spain and Austria, where the new bullet took the form of a steel point or needle, in a lead case, and the introduction of which necessitated the re-sighting of all rifles and the adoption of new powder.

FIELD ARTILLERY. The perfection of fire control was the principal subject of study in the field artillery of armies during the year 1908. Nearly all countries completed their rearmament with rapid fire field guns, and this proved the largest single item of expenditure for the previous eight years. The development of heavier guns for the artillery of mobile armies was a marked characteristic of the past year. Field artillery armament came to be classified as indicated below:

1. *Light field guns*, with which all modern armies are supplied. These guns were all of the latest rapid fire type, the oldest gun in service being that of Norway, which was adopted in 1900, and the newest, of which there was an accurate detailed description, that of Greece, adopted in 1907, although several countries bought new guns in 1908. All of the twenty-seven countries adopting new guns for their field artillery in the previous five years had practically completed their rearmament at the beginning of 1909. The usual calibre of these guns was about three inches; in eighteen countries it was 2.95 inches, and this was the smallest calibre, the largest being the 3.3 inch gun of Great Britain. The shrapnel fired by these guns varies between 12.1 and 15.95 pounds, except for the British gun mentioned above, which fired a shrapnel weighing 18.48 pounds; the usual weight was about 14.3 pounds. The muzzle velocity varies from 1,525 feet per second to 1,940 feet per second, the latter referring to the Russian gun. Complete details of all these guns may be found in the *Journal of the United States Infantry Association*, January, 1909. 2. *Mountain guns* were largely increased in importance by the experiences of the Russo-Japanese war and were considered a part of the equipment of all armies. Strangely enough, China was probably the very first country to adopt a rapid fire mountain gun, having purchased three six-gun batteries from Schneider in 1905, which order was subsequently increased. Portugal and Greece bought Schneider guns in 1908 and Russia and Switzerland bought a similar gun from Krupp, the most powerful of all being that of Greece. The most important development of mountain guns during the past year was the "differential recoil" mechanism of the French automatic mountain gun, which may be applied to any gun, increasing its power by about thirty per cent. 3. *Horse*

artillery guns did not make as much progress as the other types, the latest development being that of the British Army, which was said to be a very wonderful weapon. 4. *Light field howitzers* had a steady development and were considered as an essential part of the armament in all countries. The difficulty of adapting the long recoil system to this class of ordnance had been overcome. 5. *Heavy field guns* commanded much attention throughout the world and experiments were conducted in nearly all countries, notably Japan, Russia, Italy, Portugal, Servia, Switzerland, and Spain, looking to the adoption of a suitable type. The Japanese gun of 5.9 inch calibre fired a projectile of about 80 pounds, and was probably the equal of any gun of its class in service.

The United States Ordnance Department continued the development of field artillery armament, and designed a new system of guns and howitzers, of which only the light field gun had been issued to the service in general. The guns which were fairly representative of prevailing tendencies may be taken as a typical system and are classified as follows:

Designation	Calibre	Weight of projectile	Weight behind teams, lbs.
Mountain howitzer....	3.	15	300 (packs)
Light gun	3.	15	4000
Light howitzer	3.8	30	4000
Howitzer	4.7	60	6000
Gun	3.8	30	6000
Heavy field gun	4.7	60	8000
Heavy field howitzer.	6.	120	8000

In this system, which is a very complete one, it will be seen that each gun is supplemented by a howitzer of equal mobility, but firing a projectile twice as heavy as that of the gun, and a gun and howitzer of the same calibre fire the same ammunition.

CAVALRY. Dismounted action of cavalry continued to be the principal subject of study for this branch of service, and was a matter of ever increasing importance. In several countries the lance was discarded in favor of a long bayonet, carried as a side arm, and attached to the rifle in order to make the dismounted cavalry as nearly equal to the infantry as possible, and to enable it to carry fire-action to a successful issue. The number of armies attaching machine guns to cavalry regiments was largely increased, and this may be said to be the universal custom prevalent. Cavalry machine guns were usually carried on pack animals and fired from a tripod, and their rôle was to increase the fire power of cavalry, support it everywhere, and to assist in mounted and dismounted action. It should participate in the decisive action and pursue the enemy with a hot fire or cover a rally or retreat, as the case may be. The tendency of the year was to increase the proportion of cavalry to other arms of the service, as well as to increase the ballistic properties of the cavalry fire arm.

COAST ARTILLERY. Artillery of position as a means of coast defense received a great impetus from the conduct of the defense of Port Arthur. Italy, Germany, and Great Britain gave especial

attention to the strengthening of their harbor defense during the year 1908. The subject showed increasing popularity with military students, as is evidenced by the large number of articles in the professional magazines. A harbor well provided with heavy sea-coast guns and submarine mines is impregnable against naval attack. For this reason the land defense of sea-coast forts has become a subject of paramount importance and received much attention during the year, especially in the countries having the strongest coast forts.

SUBMARINE MINES. Submarine mines attained greater importance than ever before, as a result of their successful use in the Russo-Japanese war. Extensive experiments in mine laying were carried out in most military countries, and many improvements were made in the various systems in use. Mine planting vessels were constructed, in some countries armored cruisers being converted for this purpose, and an unprecedented activity in this field was everywhere visible. In spite of the limitations imposed by the last Hague Conference, floating mines continued in favor.

MILITARY BALLOONING. Military ballooning made more rapid strides than any other single department of the art and science of war. The success of aeroplanes was the distinctive feature, the Americans, Wilbur and Orville Wright, being the leaders in this class. See **AERONAUTICS**. All military budgets for the year carried considerable appropriations for aeroplanes, and laws governing their use began to appear in different countries, as well as specially designed motor cars armed with rapid fire guns to attack hostile airships.

For further details of military progress see the heading *Army*, under the different countries.

MILITIA. The year was a notable one in the history of the militia of the United States. It was marked by the establishment on Feb. 12 of a division in the office of the Secretary of War, to be known as the Division of Military Affairs, and by the passage of legislation which makes the militia in effect a body of reserves, to be called out at the discretion of the President. The creation of a Division of Military Affairs was made necessary by the increasing volume of general business pertaining to the militia, and special business connected with the keeping of the accounts of funds allotted to the several States, Territories, and the District of Columbia, especially under the Act of May 27, 1908, which placed the militia affairs upon a new footing. The division was made necessary also by the developing interest arising from the tendency of the militia to depend more and more on the Regular Establishment for information, instruction, and guidance in questions of equipment, drill, and training, and in business involved in connection with the joint field manoeuvres and coast defense exercises. The jurisdiction of this division embraces all administrative duties involving the armament, equipment, discipline, training, education, and organization of the militia; the conduct of camps of instruction, and participation in the field exercises and manoeuvres of the regular army; the mobilization and the relations of the militia to the regular army in time of peace; and all other matters which do not, under existing laws, regulations, orders, or practice, come within the jurisdiction of the general staff of any division or bureau in the

War Department. Lieut.-Col. Erasmus M. Weaver of the Coast Artillery, who, up to Feb. 14, had been on duty in the office of the Chief of Artillery, was on that date made chief of the Division of Military Affairs.

The Act of May 27, 1908, which amends the Act of Jan. 21, 1903, and which establishes the new relations of the State militia forces to the Federal government, contains, among others, the following provisions: The militia shall consist of every able-bodied male citizen of the respective States and Territories and the District of Columbia, and every able-bodied male of foreign birth who has declared his intention to become a citizen who is more than 18 and less than 45 years of age; shall be divided into two classes: the Organized Militia to be known as the National Guard of the State, Territory or District of Columbia, or by such other designation as may be given in the representative States and Territories; the remainder to be known as the reserve militia. The provisions of this Act apply only to the militia organized as a land force. The Organized Militia is composed of the regularly enlisted organized and active militia in the several States and Territories, and the District of Columbia, who had, previous to the passage of this amendment, participated, or who shall thereafter participate in the apportionment of the annual appropriation provided by the revised statutes of the United States. On and after Jan. 21, 1910, the organization, armament and discipline of the Organized Militia in the several States, Territories and the District of Columbia is to be the same as that which is prescribed for the regular army of the United States, subject to certain provisions. It is provided that whenever the United States is invaded or in danger of invasion from any foreign nation, or of rebellion against the authority of the government of the United States, or the President is unable, with the regular force at his command, to execute the laws of the Union, it shall be lawful for the President to call forth such part of the Militia of the State or of the States or Territories or of the District of Columbia as he may deem necessary to repel such invasion, suppress such rebellion, or to enable him to execute such laws and to issue his orders for such purpose through the Governors of the respective States or Territories, or through the commanding general of the militia of the District of Columbia, from which State, Territory or District such troops may be called to such officers of the Militia as he may think proper. The President may specify in such a call the period for which service is required, and the militia so called shall continue to serve during the period so specified, either within or without the territory of the United States, unless sooner relieved by order of the President. The Organized Militia shall be called into the service of the United States in advance of any volunteer force which it may be determined to raise.

When the militia of more than one State is called into actual service of the United States by the President, he may in his discretion apportion them among such States or Territories or to the District of Columbia according to the representative population. The militia, when called into the actual service of the United States, is to be subject to the same Rules and Articles of War and the same pay and allowances as the regular troops of the United States.

It is provided that in each State, Territory and the District of Columbia an Adjutant-General shall be appointed to perform such duties as may be prescribed by the laws of such State or Territory and make returns to the Secretary of War of the strength of the organized militia and such other reports as may from time to time be required by the Secretary of War. An abstract of the returns and reports of these adjutant-generals shall be transmitted each year by the Secretary of War with his Annual Report to Congress. A member of the militia, disabled by reason of wounds or disabilities received or incurred in the service of the United States, is entitled to all the benefits of the pension laws existing at the time of his service.

This Act marks the first time that the powers of Congress with respect to the militia, which are granted by the Constitution, have been fully exercised. The Act approved Jan. 21, 1903, was a long step in advance toward exercising these powers, but it failed in certain essential particulars to create a body of organized militia that would be of general utility in case of emergency, in that the authority given to the President to call forth the militia was so restricted as to limit the period of service of the militia called forth to nine months and as to prohibit the use of the troops so called to the service of the United States beyond the limits of the United States. The Act of May 27 removes these two restrictions and makes the body

^a No organized militia.

of the Organized Militia of the several States available for service during the period of the enlistment of the officers and men within and without the boundaries of the United States. It will not be necessary as heretofore to go through the formalities of newly enlisting the Organized Militia when called by the President. The call of the President itself accomplishes the transfer of the Organized Militia, which is called forth by him from its State relations to its Federal relations. It becomes a part of the army of the United States and the President becomes its commander-in-chief. He is also the exclusive judge of the existence of an emergency which would justify the calling forth of the Organized Militia. Provisions are made in the enactment for the mobilization, transportation, and equipment of the Organized Militia on its new footing.

On May 29, 1908, the Secretary of War appointed a body of five officers, consisting of Brigadier-General Nelson H. Henry, Adjutant-General of New York; Brigadier-General Oran Perry, Adjutant-General of Indiana; Brigadier-General Charles R. Boardman, Adjutant-General of Wisconsin; Brigadier-General James A. Drain, Chief of Ordnance of Washington; and Brigadier-General Bibb Graves, Adjutant-General of Alabama, to represent the Organized Militia of the United States in consultation with the Secretary of War respecting the condition, status, and needs of the whole body of the militia. This body met in Washington from June 15 to 17, and as a result of their deliberations, made certain recommendations to the Secretary of War in regard to equipment, ammunition, and inspection of the militia.

During 1908, in addition to field manœuvres, participated in by both regulars and militia and held on a large scale at Pine Plains, N. Y., Chickamauga Park, Ga., Fort Benjamin Harrison, Ind., Fort Riley, Kan., Fort D. A. Russell, Wyo., Leon Springs, Tex., American Lake, Wash., and Atascadero, Cal., joint army and militia coast defense exercises were held in Massachusetts, Rhode Island, Connecticut, New York, Delaware, Maryland, District of Columbia, North Carolina, South Carolina, Georgia, Florida, and Alabama. An approximate total of 45,000 officers and men of the Organized Militia participated in the joint manœuvre camps of the field troops, and approximately 10,100 officers and men in the joint army and militia coast defense exercises. The reports from these manœuvres and exercises indicate that they were successfully conducted. The general scheme of the joint manœuvres of the field troops contemplates that they shall take place only in every alternate year, and that each State on its own initiative shall arrange to have yearly encampments of all the State forces within its own borders.

The chief of the Division of Militia Affairs, in his annual report, states that it is believed from inquiry of adjutants-general of the States, that the average efficiency of the militia is progressing toward a higher standard from year to year. There is a disposition on the part of the military authorities of those States whose standard is below what may be considered the average, to compare means and methods with those of the States having the best standards.

The table on the preceding page shows the strength (officers and enlisted men) of the Organized Militia by branches of the service, as

shown by the special inspection made by the United States inspection officers during the spring of 1908.

MILK. See DAIRYING.

MILTON, WILLIAM HALL. An American legislator, United States Senator (Democrat) from Florida. He was born in Jackson County, Fla., on Mar. 2, 1864, was educated in the public schools and at the Agricultural and Mechanical College at Auburn, Ala., and was admitted to the bar in 1890. He served as city clerk of Marianna, Fla., from 1885 to 1893, as State legislator in 1889, and as presidential elector in 1892. In 1894 he was appointed United States Surveyor-General by President Cleveland, and in 1898 was elected Mayor of Marianna. He was for some years president of the board of managers of the State Reform School at Marianna. On Mar. 27, 1908, he was appointed United States Senator by Governor Broward to fill the vacancy caused by the death of William James Bryan (q. v.) His term expires on Mar. 3, 1909.

MINERALOGY. The work of Penfield and Stanley on the chemical constitution of the amphiboles, reviewed in the YEAR BOOK for 1907, brought to light the existence of fluorine and water as integral parts in the molecular structure of these minerals and evidence that the amphiboles are essentially metasilicates. As a further contribution to the subject, careful analyses were made of five specimens of tremolite from different localities selected by reason of the exceptional purity exhibited by the examples. The results of the analyses, as communicated by E. T. Allen and J. K. Clement, show from 1.72 to 2.5 per cent. of water, which is in practical agreement with the previous work of Penfield and Stanley. The writers were disinclined, however, to regard the water as chemically combined, since it was driven off very gradually with rising temperatures and without apparent effect upon the homogeneous character of the mineral. They hold the opinion rather that the water is dissolved and that tremolite is a solid solution. The effect of radium emanations in changing the color of minerals has been the subject of numerous experiments. By heating some minerals to high temperatures, K. Simon found that they lost their characteristic coloration, but on subjecting the stones to radio-activity they again assumed colors like the original ones. Thus, zircon after bleaching by heat became brown, amethyst violet, smoky quartz brown, and rose topaz orange red. The experiments seemed to indicate that the coloration is due to the presence of inorganic substances different from the minerals themselves. Though the coloring property inherent to these substances undergoes change by heating, the change can be reversed by radio-activity, and in some instances by exposure to sunlight. Several new minerals were described during the year. *Natrochalcite* occurs in bright emerald-green crystals of monoclinic habit, and is a hydrous sulphate of copper and sodium. It is found in old copper mines in the district of Chuquicamata, Antofagasta Province, Chile. *Palmierite* is an anhydrous sulphate of lead, potassium, and sodium, found in the lava of the Vesuvian eruption of April, 1906. It crystallizes in hexagonal scales. *Rutherfordine* is the name given to a yellow uranyl carbonate, resembling uranochre in appearance, from German East Africa. The mineral possesses strong radio-active properties.

Tarbuttite, a hydrous phosphate of zinc, forms colorless or faintly colored crystals, and is found in the Broken Hill mines of Rhodesia. *Hulsite* comes from the tin-bearing region of the Seward Peninsula, Alaska. It is an iron-magnesian borate of black color, prismatic cleavage, and a hardness of 3 on the Mohs scale. The original occurrence is on Brooks Mt., near the contact of granite and limestone. *Paigeite*, from the same vicinity, is a coal black lustrous mineral, resembling hulsite in composition, but with a smaller percentage of boron. See DIAMONDS.

MINERAL PRODUCTION OF THE UNITED STATES. The table of the mineral and metal production of the United States in 1906 and 1907 given below has been taken from the annual reports for *Mineral Resources of the United States*, of the United States Geological Survey, published in 1908. In 1907, for the first time in the history of the mineral industry of the United States, the value of the total production exceeded \$2,000,000,000, and also it was somewhat in excess of that of 1906, which amounted to \$1,904,007,034, the gain amounting to 8.68 per cent. as compared with 17.15 per

cent., which represented the gain for 1906 over 1905. Iron and coal still head the list as the most important mineral products, and show considerable increase, but the gains were general in both metallic and non-metallic minerals. In 1908 the mineral industry in common with other business suffered from the general depression and financial conditions, and as a result there was a considerable curtailment in the production. Copper and petroleum alone showed any marked increase, gold held its own with a small gain, while among manufactured products copper sulphate and zinc oxide showed an increase. The accompanying preliminary statistics published by *The Engineering and Mining Journal*, though issued subject to revision, indicate very closely the output of the most important products for the year 1908, as compared with similar figures for 1907. Detailed statistics of production and information of the progress of the various industries during 1908 and the years immediately preceding will be found under the following captions: ALUMINUM; ANTIMONY; ARSENIC; COAL; COKE; COPPER; GOLD; IRON AND STEEL; LEAD; MANGANESE; MERCURY; MINERAL PRODUCTION; NICKEL; SILVER; PETROLEUM; PLATINUM; TIN; ZINC.

MINERAL PRODUCTION IN THE UNITED STATES, 1906-1907.

From *Mineral Resources of the United States*, 1907, U. S. Geological Survey.

(a) Production of iron ore—1906: 47,749,728 long tons; value at mines, \$100,597,106. 1907: 51,720,619 long tons; value at mines, \$131,996,147. Statistics for iron ore and for value of pig iron are collected by the Survey; statistics for output of pig iron are furnished by the American Iron and Steel Association.

(b) By "spot" value is meant value at the point of production.

(c) Long tons are tons of 2,240 avoirdupois pounds; short tons are tons of 2,000 avoirdupois pounds.

(d) Average price per troy ounce in 1906 was 67 cents; in 1907 it was 66 cents.

(e) Prior to 1906, coining value, \$20.6718 per troy ounce; in 1906, coining value, \$20.671834; in 1906 and 1907, coining value, \$20.671834626323.

(f) The product from domestic ores only.

(g) Of 76½ avoirdupois pounds net; of 75 avoirdupois pounds net since June, 1904.

(h) Consumption in 1904, 1905, 1906, and 1907.

(i) Includes antimony smelted from imported ores and antimony contained in hard lead.

(j) Includes nickel in copper-nickel alloy and in exported ore and matte.

(k) Included under unspecified.

(l) In 1906, 2,500 pounds of metallic tin, 55 short tons of concentrates from Alaska, and 14 short tons of concentrates from North Carolina and South Carolina.

(m) Includes brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania. 1906: 36,401,217 short tons; value at ovens, \$91,608,034. 1907: 40,779,564 short tons; value at ovens, \$111,539,126.

(n) Of 42 gallons.

(o) Value of clay mined and sold as unmanufactured clay. 1906: \$3,245,256. 1907: \$3,448,548.

(p) Of 380 pounds net.

(q) Includes limestone for iron flux, but not including grindstones.

(r) Of 280 pounds net. Value is for net product exclusive of cost of packages.

(s) Includes metallic paint, ochre, umber, mortar, colors, sienna, ground slate, shales, sublimed blue lead, sublimed white lead, and zinc lead.

(t) Includes pearls valued at \$381,000 in 1906 and at \$264,500 in 1907.

(u) Includes nitrate of soda, carbonate of soda, sulphate of soda, and alum clays used by paper manufacturers; and molybdenum, nickel and cobalt, tantalum, titanium, uranium, and vanadium, valued together at \$31,945.

MINERAL AND METAL PRODUCTION OF THE UNITED STATES, 1907-1908.

(a) Includes zinc-lead pigment.

MINNESOTA. One of the North Central Division of the United States. Its area is 84,682 square miles. The population according to a Federal census of 1908 was 2,117,022.

MINERAL PRODUCTION. The chief mineral production of the State is iron ore, and of the total value of the iron output Minnesota contributes over five-sixths. In 1907, 28,969,658 long tons were produced, valued at \$76,668,836. It is important compared with the production of 1906, which was 25,364,077 tons, valued at \$51,799,256. The production and consumption of iron ore in 1908 showed a very considerable decrease as the result of the cutting down of operations due to financial conditions. The Lake Superior ores furnished the raw material for from 75 to 80 per cent. of the pig iron production. The estimated output of the Lake Superior region for 1908 was 25,927,000 tons. A portion of this production (about 30 per cent.), however, is to be credited to Michigan and Wisconsin. In addition to iron, clay products were produced in the State in 1907 to the value of \$1,689,933; mineral waters, \$524,800; stone, \$1,582,126, and other products, \$1,441,313. The value of the mineral products of the State, exclusive of iron, in 1907, was \$5,457,422.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to the figures of the United States Department of Agriculture, were as follows: Corn, 46,835,000 bushels, valued at \$25,759,000, from 1,615,000 acres; spring wheat, 68,557,000 bushels, valued at \$64,444,000, from 5,356,000 acres; oats, 59,004,000 bushels, valued at \$25,372,000, from 2,682,000 acres; barley, 32,500,000 bushels, valued at \$15,925,000, from 1,300,000 acres; rye, 1,628,000 bushels, valued at \$1,026,000, from 88,000 acres; buckwheat, 91,000 bushels, valued at \$66,000, from 5,000 acres; flaxseed, 4,526,000 bushels, valued at \$5,431,000, from 427,000 acres; potatoes, 11,020,000 bushels, valued at \$6,171,000, from 145,000 acres; hay, 1,527,000 tons, valued at \$8,428,000, from 909,000 acres. In the acreage and production of wheat Minnesota ranks third, being surpassed only by Kansas and North Dakota, while in spring wheat alone, it occupies first rank. The wheat crop increased in 1908 from the figures of 1907 which were 67,600,000 bushels. In the production of barley, Minnesota occupies first place. The crop in 1908 showed a considerable increase over that of 1906, which was 26,663,000 bushels. In the production of oats, Minnesota is surpassed only by Iowa and Wisconsin. There was a slight decrease in 1908 from the production of 1907, which was 61,985,000 bushels. A small quantity of beet sugar is produced in the State. The farm animals on Jan. 1, 1909, were estimated as follows: Horses, 752,000; mules, 9,000; dairy cows, 1,092,000; other cattle, 1,253,000; sheep, 468,000; swine, 1,153,000. Compared with 1900 these figures show an increase of 10 per cent. for dairy cows and about 25 per cent. for other cattle. The wool clipped in 1908 was 2,531,250 pounds, valued at \$520,931.

MANUFACTURES. Very considerable progress was made in manufacturing between the census of 1900 and that of 1905. The latter reported 4,756 establishments classed as factories, with \$184,903,000 capital, 69,636 wage-earners, and products valued at \$307,858,000, these figures being, respectively, 16.1, 38.9, 7.9, and 37.6 per

cent. larger than in 1900. The value of products of the five leading industries were: Flour and grist mills, \$122,059,000; lumber and timber products, \$33,183,300; slaughtering and meat packing, \$17,526,700; cheese, butter, and condensed milk, \$12,871,100; and printing and publishing, \$11,105,300; these values were, respectively, 47.1, 4.9, 124.4, 51.8 and 44.6 per cent. greater than those of 1900. Minnesota is pre-eminent in the flour milling industry. The products in 1905 were 23,871,227 barrels of wheat flour, 132,671 barrels of rye flour, 66,018 barrels of corn meal, 198,217 tons of feed, and 933,525 tons of offal. About 90 per cent. of the value of lumber products was credited to white pine and most of the remainder to Norway pine. The dairy products included 58,542,838 pounds of butter, valued at \$11,549,800. Other important industries in 1905 were: Planing mill products, railway repair-shop work, manufacture of linseed oil, foundries and machine shops, malt liquors, and boots and shoes. Values were credited to leading cities as follows: Minneapolis, \$121,593,000; St. Paul, \$38,318,700; Duluth, \$10,139,000; and Winona, \$7,850,000.

EDUCATION. The report of the State Superintendent showed a total enrollment in 1908 of 430,748 out of a total population of approximately 600,000 (ages 5 to 18). The average daily attendance in 1908 was 334,600. There were 206 State-aided high schools, with 992 instructors, and a total enrolment of 24,530. There were 152 graded, 340 semi-graded, 1,305 first-class rural, and 632 second-class rural schools, with a total enrollment of about 252,000, of whom 26,500 were in graded schools. The State high schools received \$1,400 each, graded schools \$525 each, and for other classes \$230, \$105, and \$40 each, respectively. Teachers in common school districts in 1908 numbered 9,169, of whom 85 per cent. were women. The average monthly salary of men teachers was \$53.30 and of women \$40.82. Teachers in independent and special districts numbered 542 men and 4,719 women, with average monthly salaries of \$108.87 and \$52.93, respectively. The total number of teachers in 1908 was 14,430. The average length of term in common school districts in 1908 was 7 months, and of independent and special districts, 9 months. The total enrollment in the five State normal schools in 1908 was 4,114. The total expenditures for public schools were \$11,495,615. The permanent school fund was \$19,709,383, and the permanent university fund, \$1,413,817.

FINANCE. The report of the State treasurer for the fiscal year ending July 31, 1907, showed a balance in the treasury, Aug. 1, 1906, of \$1,810,904. The receipts for the fiscal year 1907 were \$11,250,342 and the disbursements were \$10,660,813, leaving a balance in the treasury, July 31, 1907, of \$2,400,432. Of the receipts, \$1,293,939 were from the permanent school fund, \$1,539,481 from the general school fund, \$7,062,755 from the revenue fund. From the general university fund was received \$471,867. The permanent school funds of the State amounted to \$12,924,855 and the permanent university fund to \$1,177,714. The State debt on July 1, 1907, amounted to \$1,109,000.

CHARITIES AND CORRECTIONS. The State Sanatorium for Consumptives, authorized in 1903, was opened in Dec., 1907, with two patients. On July 31, 1908, there were 55,—23 males, 30

females. A law of 1905 provided that district courts in counties having a population of at least 50,000 should have original and exclusive jurisdiction in special juvenile courts. These courts were given charge of neglected, dependent, or delinquent children under seventeen years of age, were authorized to appoint probation officers for delinquent children, and were given wide discretion in disposing of all children included under the act in homes or private or public institutions. New institutions provided for in 1907 were detention hospitals at the various asylums for the insane, a hospital for dangerous or criminal insane at St. Peter, an Industrial School for Girls at Sauk Center, (no buildings erected yet), a hospital farm for inebriates, and a hospital for crippled and deformed children at St. Paul. A law of 1907 also provides for the appointment of State agents for the care of the insane after their discharge from hospitals. A statement of the Board of Control gave the number of inmates of the hospitals for the insane on July 31, 1908, as follows: Anoka, 416; Hastings, 424; Fergus Falls, 1,578; Rochester, 1,161; St. Peter, 981; total, 4,560, of whom 2,608 were males and 1,952 females; the total current expense was \$717,771.03. The population of other institutions on the same date was: School for the Blind, Faribault, 93; School for Feeble-Minded, Faribault, 1,113; School for Deaf, Faribault, 275; State Public School, at Owatonna, 202; State Training School, Red Wing, 397; State Reformatory, St. Cloud, 318; State Prison, Stillwater, 665. The total current expense of all institutions, including insane asylums, was \$1,347,089.39, excluding the Sanatorium, which is partially supported by patients.

POLITICS AND GOVERNMENT. There was no meeting of the State Legislature in Minnesota in 1908. On Jan. 8, Judge Sanborn, of the United States Circuit Court, at St. Paul, appointed A. B. Stickney and Charles H. F. Smith receivers for the Chicago Great Western Railroad. Mr. Stickney was president of the road. This action followed the inability of the company to meet obligations falling due in 1908, which creditors refused to extend. The loss through the boiler makers' strike in the fall of 1907 was given as a partial cause of the financial troubles of the road. The Great Western owns in fee, without mortgage, lines of railroads in Illinois, Iowa, Minnesota, Kansas, and Missouri. On Mar. 23d, the United States Supreme Court handed down a decision declaring the Minnesota railroad law passed in 1907, unconstitutional. (See RAILWAYS.) By a decision, unanimous except for Justice Harlan, the court held that where such laws affected the rights of the railroads or their stockholders guaranteed by the Constitution of the United States, the subordinate Federal courts had authority not only to hear the claims raised, but also to stay the execution of such laws, notwithstanding the prohibition contained in the Eleventh Amendment against the institution of suits against a State. In the Minnesota case, the controversy arose from the enactment, first, of the two-cent rate law and the excessive penalties that were provided against the railroads or their officers who refused to comply with its terms, \$5,000 fine and five years' imprisonment for each refusal to sell a ticket at the rate named. For a fuller discussion of this decision, see the article RAILWAYS. On April 3, Chief Justice Clabaugh, of

the Supreme Court of the District of Columbia, decided a case in favor of the Secretary of the Interior, the effect of which will be to turn over to the State of Minnesota several hundred thousand acres of land. The decision was in the case of Gus A. Beaulieu, who, acting on behalf of the Chippewa tribe of Indians, sought to restrain the Secretary of the Interior from turning over the lands in question to the State. The Indians claimed that the lands should be sold and the proceeds divided among them, but the Secretary of the Interior decided that the lands should be allotted to the State under an act of Congress giving to it lands that were swampy in character. These lands are in the ceded Chippewa Indian Reservation in Minnesota.

CONVENTIONS AND ELECTIONS. On Mar. 11, town and village elections were held throughout the State. In many places the question of liquor prohibition was submitted to the voters. The Prohibitionists were victorious in 18 towns and villages, and the advocates of license in 20. On May 17, Democratic primaries were held throughout the State to choose delegates to the State Democratic Convention on May 14, when delegates to the National Convention were to be selected. The result showed an overwhelming sentiment in favor of Governor John A. Johnson for presidential candidate. His supporters carried every district in the State and all but two counties. The convention, which met on May 14, selected delegates-at-large and also delegates from the nine districts. Resolutions were passed unanimously instructing the delegates to vote for Governor Johnson for President as long as he should be a candidate. The resolution also declared for the support of the nominee, whether he were Johnson or some other candidate. The Republican Convention for the nomination of delegates to the National Convention met at Minneapolis on April 16. The delegates-at-large chosen were instructed to vote for William H. Taft. Resolutions were adopted praising the administration of President Roosevelt, and "especially his effort for the establishment of a sound financial system, the enforcement of the laws, and proper regulation of corporations, for free competition in business, for the protection of property rights, for the stability of government and for the maintenance of the highest standard of business integrity and civic duty." The Republican State Convention to nominate candidates for Governor and other officers was held at St. Paul on June 31. J. P. Jacobson was nominated Governor. On Aug. 19, the Democratic Convention for the nomination of a candidate for Governor met at St. Paul. In spite of his declaration previous to the convention that it would be impossible for him to be a candidate for the third time, Governor John A. Johnson was unanimously renominated, and Governor Johnson accepted the nomination. The results of the election of Nov. 3 were a notable example of the effects of independent voting, for while Taft received a plurality over Bryan of over 85,000 votes (Taft, 155,416; Bryan, 109,504; Chafin, 8658; Debs, 10,021), Governor John A. Johnson, the Democratic candidate, was reelected by a majority of 20,000 votes (173,845-153,667). The cities of St. Paul, Minneapolis, and Duluth gave Johnson a plurality of about 20,000 over his Republican opponent.

OTHER EVENTS. Forest fires did considerable damage in the State in September and October, especially in St. Louis, Carlton, and Itasca

counties, although the damage done was not great as compared with that in the neighboring States of Michigan and Wisconsin. On June 22, a wind storm broke over Minneapolis and St. Paul and caused damage to property estimated at \$1,000,000.

STATE OFFICERS. Governor, John A. Johnson, Dem.; Lieutenant-Governor, A. O. Eberhart, Rep.; Secretary of State, Julius A. Schmahl, Rep.; Auditor, S. G. Iverson, Rep.; Treasurer, C. C. Dinehart, Rep.; Attorney-General, Geo. T. Simpson, Rep.; Adjutant-General, Fred. B. Wood, Dem.; Superintendent of Education, J. W. Olson, Rep.; Commissioner of Insurance, J. M. Hartigan, Dem.

JUDICIARY. Supreme Court: Chief Justice, Charles M. Start, Rep.; Associate Justices, Calvin L. Brown, Rep.; Edward A. Jaggard, Rep.; Charles L. Lewis, Rep.; Charles B. Elliott, Rep.; Clerk, C. A. Pidgeon, Rep.

The State Legislature of 1909 is composed of 43 Republicans and 20 Democrats in the Senate; 94 Republicans, 22 Democrats, and 3 Prohibitionists in the House. The State representation in Congress will be found in the article UNITED STATES, under the section *Congress*.

MINNESOTA, UNIVERSITY OF. An institution of higher learning at Minneapolis, founded in 1851. In 1907-8 the attendance was 4,421, and in the autumn of 1908, 4,687. The distribution is as follows: College of science, literature and the arts, 1,484; engineering, 473; agriculture, 931; law, 500; medicine, 173; dentistry, 176; pharmacy, 99; mines, 148; chemistry, 58; education, 32; graduate school, 107; summer school, 1,040. A large majority of the students are from the State and one-third of all are women. In 1907, about thirty acres were added to the campus by act of the Legislature, and provision has been made for the new buildings by the college of engineering, medicine, dentistry, and pharmacy. The entire income of the University is \$692,000, of which \$116,000 is from the United States government. The President in 1908 was Cyrus Northrop. He announced his resignation to take effect in 1909. A successor had not been chosen at the end of the year.

MINOR PLANETS. See *ASTRONOMY*.

MISSIONARY ASSOCIATION, AMERICAN. A society under the auspices of the Congregational denomination, organized in 1846 to carry on educational and missionary work, a feature of the latter being industrial training among the eight different peoples comprised in the population of the United States. The association has its largest field in the South, where there are missions and schools for negroes and mountaineers. Work is carried on also in Alaska, Hawaii and Porto Rico, and among Indians, Chinese, and Japanese. The association has 823 missionaries, and under its auspices are 101 schools with 17,690 pupils, and 238 churches, having 14,196 members. Institutions covering instruction from kindergarten and primary work to professional training to the number of 63 are maintained for the negroes of the South. The receipts for current work for the year ending Sept. 30, 1908, were \$387,728.81, and the expenditures were \$379,695.55. The amount paid on the debt was \$8,033.26, which reduced the debt balance to \$46,917.92. The donations from churches and individuals were \$183,213.10, a decrease of \$21,326.21 over the previous year. Donations from estates were \$115,975.91, a decrease

of \$9,422.99 over the donations of 1907. The official organ of the association is *The American Missionary*, issued in ten monthly numbers each year. The honorary secretary and editor is Rev. A. F. Beard, D.D.; corresponding secretaries, Rev. James W. Cooper, D.D., and Rev. Charles W. Ryder, D.D.; treasurer, H. W. Hubbard, 287 Fourth Avenue, New York City.

MISSIONS, PROTESTANT FOREIGN. The following statistics relating to foreign missions are taken from the *Almanac of Missions* issued by the American Board of Commissioners for Foreign Missions. The leading missionary societies in the evangelical churches of the United States in 1907-8 were as follows (the communicants, number of missionaries, and the total income are given, together with the number of stations maintained): American Board of Commissioners for Foreign Missions (Congregational): Communicants, 71,137; missionaries, 208 men, 386 women; principal stations, 107; income, \$837,999. Presbyterian Board of Foreign Missions, U. S. A., North: Communicants, 85,487; missionaries, 398 men, 550 women; principal stations, 148; income, \$1,347,295. Presbyterian Board, U. S. A., South: Communicants, 9,064; missionaries, 105 men, 111 women; principal stations, 49; income, \$323,878. United Presbyterian Church, North America: Communicants, 24,097; missionaries, 58 men, 116 women; principal stations, 24; income, \$306,197. Reformed Church in America: Communicants, 5,282; missionaries, 42 men, 69 women; principal stations, 23; income, \$197,468. Reformed Church in the United States: Communicants, 2,650; missionaries, 22 men, 30 women; principal stations, 5; income, \$96,100. Evangelical Lutheran General Synod, U. S. A.: Communicants, 13,063; missionaries, 15 men, 24 women; principal stations, 9; income, \$74,531. American Baptist Missionary Union: Communicants, 143,873; missionaries, 250 men, 365 women; principal stations, 117; income, \$934,434. Methodist Episcopal Church: Communicants (including probationers), 235,018; missionaries, 343 men, 638 women; principal stations, 170; income, \$2,050,237. Protestant Episcopal Church: Communicants, 11,170; missionaries, 119 men, 128 women; principal stations, 87; income, \$728,202. Foreign Christian Missionary Society: Communicants, 10,435; missionaries, 84 men, 86 women; principal stations, 48; income, \$223,689. The total number of communicants represented by the foreign missions of all the evangelical churches in the United States was in 1907-8 672,103. There were 1,105 principal stations maintained, with 10,410 out-stations. The total number of men missionaries was 2,063, and women, 3,054. There were 27,319 native laborers and 5,745 churches. Under instruction were 344,533. The total income was \$9,147,364, and the native contributions amounted to \$1,564,981.

Following are notes on mission work in some of the more important fields: In India there are now said to be 91 missionary organizations of America and Europe engaged in missionary work, with a total missionary force of about 4,000. The native force far outnumbers the foreign, consisting of 26,000 men and women, of whom 1,100 are ordained. During the year the church union in southern India between various missionary organizations, Presbyterian, London Missionary Society, and the American Board of Commissioners for Foreign Missions, has resulted in great good. In China are nearly 4,000

missionaries, including physicians connected with the Protestant foreign missions. There are 5,102 stations and out-stations. The total number of communicants reported at the Shanghai Conference in 1907 was 154,000. The latest statistics in regard to Protestant mission work in Japan give the total number of foreign missionaries, including wives, as 886; the number of organized churches, 453; number of preaching places, other than churches, 751; number

of Japanese ordained ministers and helpers, 698; number of communicants, 54,352. For additional notes on Missions see the articles on the different Protestant denominations. The following table, taken from the *Almanac of Missions*, published by the American Board of Commissioners for Foreign Missions, gives the number of missionaries from different portions of the globe, the number of native laborers, the number of communicants, and other information:

Countries	Stations and Out-stations	Missionaries		Native Laborers	Communicants	Added Last Year	Under Instruction	Income
		Men	Women					
United States	11,515	2,063	3,054	27,319	672,103	80,994	344,533	\$9,165,603
Canada	420	163	198	638	16,055	912	6,654	544,158
Great Britain & Ireland	13,809	3,064	3,377	36,654	550,016	29,651	597,001	8,293,599
Continental Europe	7,039	1,523	1,450	13,558	134,129	20,895	235,922	2,745,430
Totals	32,783	6,813	8,079	78,169	1,372,303	132,452	1,184,110	\$20,748,790

MISSISSIPPI. One of the South Central Division of the United States. Its total area is 46,665 square miles. The population, according to a Federal estimate made in 1908, was 1,780,606.

MINERAL PRODUCTION. The mineral products of the State are relatively unimportant. They include clay products, which were produced in 1907 to the value of \$846,529, as against a value of the same product in 1906 of \$851,080. The State produced in 1907 425,500 gallons of mineral water, a marked increase over the production of 1906, which was 254,279 gallons. The value of the production of 1907 was \$93,350, as compared with a value in 1906 of \$52,820. Other mineral products are coal products, sand and gravel, and sand-lime brick. According to the figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$1,024,302, as compared with a value in 1906 of \$954,559.

AGRICULTURE AND STOCK RAISING. The acreage, production, and value of the principal farm crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 45,845,000 bushels, valued at \$38,051,000 from 2,650,000 acres; winter wheat, 14,000 bushels, valued at \$14,000 from 1,000 acres; oats, 2,188,000 bushels, valued at \$1,466,051,000 from 2,650,000 acres; winter wheat, valued at \$28,303 from 1,100 acres; potatoes, 728,000 bushels, valued at \$677,000 from 8,000 acres; hay, 122,000 tons, valued at \$1,342,000 from 81,000 acres; tobacco, 25,000 pounds, valued at \$6250 from 100 acres. In the production of cotton Mississippi ranked third in 1908, being surpassed by Texas and Georgia. The estimated crop for 1908-9 was 1,560,000 bales, which was about the same as the crop of 1907-8. The number of farm animals has remained practically constant since 1900. The estimated value of the wool clip in 1908 was \$139,200.

MANUFACTURES. Manufacturing is still unimportant, though rapid progress was made between the censuses of 1900 and 1905. The latter reported 1,520 factories, with \$50,256,000 capital,

38,690 wage-earners, and products valued at \$57,451,000, these four items exceeding the corresponding ones of 1900 by 17.5, 121.3, 44.4, and 70.4 per cent., respectively. Of the wage-earners 2,054 were women, and 1,272 were children under 16. The leading industries in 1905 were lumbering, with products valued at \$24,035,500, and the manufacture of cottonseed products, with products valued at \$12,587,000. These values were respectively 57.2 and 88.4 per cent. greater than the corresponding values in 1900. Yellow pine represented 70 per cent., oak 12 per cent., cotton-wood 4.8 per cent., cypress 4.7 per cent., gum 3.3 per cent., and poplar 1.4 per cent. of the timber value. The cottonseed products included 22,329,400 gallons of oil and 224,953 tons of meal and cake. Other industries in 1905 were railway shops, turpentine and resin, cotton goods, planing mill products, and canning oysters. Meridian was credited with products valued at \$3,267,600, Vicksburg with \$1,887,924, and Natchez with \$819,729.

EDUCATION. The last report of the State Superintendent of Education is for the biennium 1906-7. Although progress made in educational development during the school year 1906-7 was not so great as could have been desired, considerable progress was made in arousing public school sentiment and in raising school funds by local assessment. There was still lacking a State normal school for white teachers, provision for industrial and manual training in public schools, and adequate rural school superintendents. The number of white schools taught in 1907, exclusive of separate districts, was 4,068, and of colored, 2,951. The number of white pupils enrolled was 174,782, and of colored, 248,095. The numbers in average daily attendance were: white, 110,623, and colored, 137,536. The total number of white teachers employed was 5,068, colored 2,308. The average monthly salary of white teachers was \$39.50, and of colored teachers \$20.52. In the foregoing statistics there are not included the returns from 117 separate districts for towns and cities, maintaining schools for at least seven months. The

enrollment in these districts in 1907 was 36,767 and 22,564.

CHARITIES AND CORRECTIONS. The appropriations for the various State institutions for 1908-9 were as follows: State Charity Hospital at Vicksburg, \$25,000; the Confederate Hospital Annex, Vicksburg, \$2,500; the Natchez Hospital, \$20,000; for the support of the insane, \$162,500; for the East Mississippi Insane Asylum, \$77,000. Other appropriations were made for the Deaf and Dumb Institute and for the Institution for the Blind.

POLITICS AND GOVERNMENT. On Jan. 21, Edmond F. Noel was inaugurated Governor of the State. On the same date the Legislature elected John Sharp Williams to the United States Senate to succeed Senator H. D. Money. Mr. Williams defeated James K. Vardaman in the Democratic primary elections held to choose nominees for the Senate in 1907. He does not take his seat in the Senate until 1911. The most notable happening in the political history of the State in 1908 was the passage of the statutory prohibition bill in February. This bill becomes operative on Jan. 1, 1909. About 90 per cent. of the territory of the State was already under local option. Another significant law was that which prohibits counties or cities hiring out prisoners. Public farms must be secured for them to be worked on, by the county authority, or they must be worked on the public roads. An attempt made in the Legislature to pass a measure providing for constitutional prohibition was defeated in the Senate on March 11 by a close vote. The bill had the support of Gov. Noel, but in spite of this it was unable to pass. On Jan. 6, Judge Wood of the Chancery Court at Gulfport declared unconstitutional an act of the Legislature which penalized railroads that remove litigation from the State to the Federal courts. The case was that of the State of Mississippi against the Louisville and Nashville Railroad. The State sought to oust the railroad from the State because the road had transferred litigation, started in the State courts, to the Federal courts.

CONVENTIONS AND ELECTIONS. The Republican State Convention for the election of delegates to the National Convention met at Jackson April 29th. There was a split between the delegates favoring instructions for Senator J. B. Foraker and those wishing an uninstructed delegation. The Foraker adherents held a separate meeting and selected delegates instructed to vote for Senator Foraker for President. The regular convention chose a full set of delegates and gave no instructions. It was understood, however, that the unanimous sentiment of the delegation was in favor of William H. Taft for President. The Democratic State Convention for the election of delegates to the National Convention met at Jackson June 17. Resolutions were adopted endorsing and instructing for W. J. Bryan for President, and condemning the Republicans for extravagance in the last session of Congress. Mississippi is the most Democratic in sentiment of any of the States, and the casting of ballots is hardly more than a matter of form. The majority of the votes cast for the Democratic candidate in the election of November 3 was, however, smaller than ever before. The figures were as follows: Bryan, 60,876; Taft, 4,505; Watson, 1,057; Debs, 1,048.

OTHER EVENTS. Much damage was caused in the State during the year by tornadoes and wind

storms. On Jan. 31, a wind storm killed 5 persons, wrecked many houses, and injured much property at Wesson. The lumber industries, of which there are many in the vicinity, were greatly damaged. On Feb. 14, a tornado passed over Jones County and other sections of the State. The Capitol at Jackson, in which the Legislature was in session, was slightly damaged. The storm was followed by heavy floods. On April 24, three tornadoes of great severity passed over the different sections of the State. One crossed the northwest corner; another crossed the Mississippi River near Natchez, causing great destruction of property in that city, and the third and worst took a northwest course through Purvis and other small towns and inflicted great losses at Purvis and immediate vicinity; 55 were killed, 200 wounded, and 2,000 made homeless. Congress made available \$250,000 for the purpose of furnishing aid to those who suffered from the disaster in Mississippi and other States. The State suffered during the year, in common with most of the other Southern States, from the terrorism of the "night riders." In September, bodies of these men undertook to stop the ginning of cotton in the southern part of the State. Notices were sent to the owners of gins to stop work under penalty of having their gins burned. The movement, which did not materialize, was restricted to a few counties. On March 14, eight persons were killed and property valued at many thousands of dollars was wrecked at Natchez, as the result of an explosion of gas in a five-story building, occupied by the Natchez Drug Company. The spread of the boll weevil in the southwestern part of the State induced a heavy migration of the negro population.

LEGISLATION. Among the important measures passed at the legislative session of 1908 were the following: A child labor law was enacted. (See CHILD LABOR.) A measure was enacted providing that any public service corporation which shall remove a suit from a State to a Federal court shall forfeit its right to carry on interstate commerce in the State. The hiring of county prisoners to an individual or corporation for any purpose was abolished. (See above.) A measure was enacted providing that any public service corporation blacklisting or refusing employment to telegraph operators only because of their affiliation with a labor organization shall be liable to actual and exemplary damages. For account of the legislation against the liquor traffic, see above, also the article PROHIBITION. A live stock sanitary board was created for the purpose of dealing with infectious diseases of animals. Several important amendments were made to the laws relating to railroads, and amendments were also made to the laws governing elections. Provision was made for the general enforcement of the anti-trust laws. A commission form of government for cities and towns was provided for, and permission was given for the adoption of such form by an election.

STATE OFFICERS. Governor, E. F. Noel; Lieutenant-Governor, Luther Manship; Secretary of State, J. W. Power; Treasurer, Geo. R. Edwards; Auditor, E. J. Smith; Superintendent of Education, P. C. Powers; Attorney-General, R. V. Fletcher; Adjutant-General, Arthur Fridge; Land Commissioner, E. W. Nall—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, A. H. Whitfield; Associate Justices, Jeff. Truly, and S. S. Calhoon; Clerk of the Court, George C. Meyers—all Democrats.

The State Legislature of 1909 is wholly Democratic. The State representation in Congress will be found in the article UNITED STATES, under the section *Congress*.

MISSOURI. One of the Central States of the United States. Its area is 69,430 square miles. The population in 1908, according to a Federal estimate, was 3,448,649.

MINERAL PRODUCTION. From the report of the State Bureau of Mines and Mine Inspection, the following figures for mineral production in 1907 are taken: (For these figures the product and value of the raw material is taken, and the value of spelter or refined zinc or zinc oxides is not included. Lead is covered by the ore itself, and not the value of the pig lead, or the other productions manufactured from the ore.) The zinc production of 1907 was 225,396½ tons, valued at \$9,056,965. The production in 1906 was 223,588 tons, valued at \$9,115,006. Lead production in 1907 showed a loss as compared with 1906, with a product of 151,291½ tons, valued at \$9,823,823, as against 160,232 tons, valued at \$10,697,582, in 1906. The financial troubles of the country cut prices for both lead and zinc ores during 1907, which seriously affected values. There was a considerable increase in the tonnage, price per ton, and total value of coal in 1907 as compared with 1906. In 1907 there were mined 4,355,494 tons, valued at \$7,306,125, as compared with 3,889,655 tons in 1906, valued at \$6,352,913. Coal was apparently less affected by the depressed trade and prices than any other mineral mined in the State. The iron production in 1907 was 107,363 tons, valued at \$329,073, as against 158,332 in 1907, valued at \$329,073, in 1906. Barytes showed an increase in both tonnage and value over 1906. There were produced in 1907, 60,370½ tons, valued at \$292,540. The production of tripoli showed a slight increase over 1906, with a value of \$48,144. The production of copper for 1907 was the largest in quantity and value yet mined in the history of the State. The value of the product was \$70,187. Copper, nickel, and cobalt by-products of some of the lead mines were mined largely in 1907 and gave promise of largely increased values during 1908. These ores are found in greater quantity than ever before in southeastern Missouri. With a new and successful plant at Fredericktown for the separation of these sulphide ores, decided advantages in the value of copper, cobalt, and nickel from the State may be expected. The minerals above named show a value for the year 1907 of \$26,823,422. To this may be added the clays, which, in 1907, were valued by the United States Geological Survey at \$6,862,000, and in addition, marble, granite, building-stone, cement, and lime-rock, whose value brings the total of all underground mining for 1907 to \$34,685,482, as against a total value in 1906 of \$55,496,317, and \$23,043,768 in 1905. The values of the gravel, glass-sand, mineral waters, natural gas, petroleum, sulphur, and several other minerals are not included in the values for 1907. According to figures by the United States Geological Survey, the value of the total mineral production of the State in 1907 was \$53,129,431, as compared with a value in 1906 of \$55,496,317. It is estimated that the production of coal in the State in 1908 decreased about 15 per cent. from the production in 1907.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm

crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 203,634,000 bushels, valued at \$116,071,000, from 7,542,000 acres; winter wheat, 22,260,000, valued at \$20,702,000, from 2,226,000 acres; oats, 13,510,000 bushels, valued at \$6,080,000, from 700,000 acres; barley, 46,000 bushels, valued at \$29,000, from 2,000 acres; rye, 192,000 bushels, valued at \$146,000, from 15,000 acres; buckwheat, 20,000 bushels, valued at \$17,000, from 1,000 acres; flaxseed, 182,000 bushels, valued at \$187,000, from 26,000 acres; potatoes, 6,800,000 bushels, valued at \$5,032,000, from 85,000 acres; hay, 4,350,000 tons, valued at \$30,450,000, from 2,900,000 acres; tobacco, 2,187,500 pounds, valued at \$273,438, from 2,500 acres. The cotton crop in 1908-9 was estimated at 54,000 bales. In the production of corn, Missouri is surpassed only by Illinois, Iowa, and Nebraska. The corn crop showed a considerable decrease in 1908 from the crop of 1907, which was 241,025,000 bushels. There was also a decrease in the production of wheat, of which 29,212,000 bushels were produced in 1907. The oat crop decreased in 1908 from 14,254,000 bushels in 1907. The production of potatoes also showed a marked decrease, the crop in 1907 having been 7,134,000 bushels. The hay crop showed a slight increase, 4,060,000 tons having been produced in 1907. The numbers of farm animals in 1909 were as follows: Horses, 995,000; mules, 337,000; dairy cows, 984,000; other cattle, 2,232,000; sheep, 997,000; swine, 3,270,000. The State ranks second in the number of mules, fourth in the number of swine and fifth in the number of neat cattle. The wool clipped in 1908 was 5,712,071 pounds, valued at \$1,306,922.

MANUFACTURES. Comparison of the census of 1905 with that of 1900 shows a gain of 69.5 per cent. in capital, 23.6 per cent. in the number of wage-earners, and 39 per cent. in the value of products. These three items in 1905 were, respectively, \$379,368,800, \$133,167, and \$439,548,900. Of the wage-earners 22,769 were women and 4,471 were children under 16. The values credited to leading industries, and, in parentheses, the per cent. of increase over 1900 were: Slaughtering and meat packing, \$60,031,100 (39.5); flour and grist mill products, \$38,026,142 (59.6); chewing and smoking tobacco and snuff, \$27,836,422 (10.9); malt liquors, \$24,154,264 (75.3); boots and shoes, \$23,493,552 (108.8); printing and publishing, \$23,015,515 (49.9); foundry and machine shop products, \$16,849,974 (11.8); lumber and timber products, \$10,903,783 (3.6); men's clothing, \$8,872,800 (no change); railway repair shops, \$8,720,400 (32); roasting and grinding coffee and spices, \$7,263,700 (40); carriages and wagons, \$6,551,100 (20); and paints, \$6,144,500 (42.3). Missouri ranked fourth in slaughtering and meat packing, seventh in flour milling, first in the manufacture of chewing and smoking tobacco, third in malt liquors, and fourth in boots and shoes. Of the total value of products St. Louis produced \$267,307,000; Kansas City, \$35,573,000; St. Joseph, \$11,573,700; Springfield, \$5,293,300; Hannibal, \$4,442,000; Jefferson City, \$3,926,600; and Joplin, \$3,006,000.

EDUCATION. Legislation in 1901 and 1907 providing for a State Library Commission greatly facilitated the establishment of school libraries in the State. In 1907 there were 6,657 such libraries, having a total of 637,530 volumes, of

which 418,655 were in rural schools. Laws of 1903 and 1907 provided for State inspectors of high schools and rural schools. Rural school inspection, under provisions of this law, has greatly stimulated the elementary schools. Probably 6,000 pupils were graduated from these schools and received high school entrance certificates. Perhaps one-half of this number were attending high schools in 1908. Four counties adopted county supervision at the election held in 1908. Twenty-four counties now have such supervision. The total school population for the school year ending June 30, 1908, was 934,659. The total enrollment for the term 1907-8 was 708,949 white and 32,796 colored. The number of white teachers was 12,282 women and 4,825 men, and of colored 504 women and 232 men. The average length of term in all schools was 145 days. The total expenditure for public schools in 1907 was \$11,712,751. The money apportioned in 1908 was \$1,564,557.67. The various permanent school funds aggregated \$13,754,150 on July 1, 1907.

FINANCE. The report of the Auditor for the year ending Dec. 31, 1907, showed a balance in the treasury on Jan. 1, 1907, of \$2,308,286. The receipts for 1907 were \$5,949,193, and the disbursements were \$7,310,329, leaving a balance in the treasury on Jan. 1, 1908, of \$947,149. The chief receipts were from the State revenue funds, from the State seminary money, from the earnings of the Missouri Penitentiary, and from the county foreign insurance tax fund. The State debt on Jan. 1, 1908, amounted to \$4,398,839. The assessed valuation of the State for 1908 was as follows: Real estate, \$1,040,252,288; personal property, \$312,036,054; merchants and manufacturers, estimated, \$106,000,000; railroad, bridge, telegraph, and telephone, \$163,482,879, or a total of \$1,621,771,213.

CHARITIES AND CORRECTIONS. The principal charitable and correctional institutions of the State, with their population in 1908, were as follows: School for the Blind, St. Louis, 108; School for the Deaf, Fulton, 327; Tuberculosis Sanitarium, Mount Vernon, 95; Confederate Home, Higginsville, 300; Federal Home, St. James, 259; Insane Hospital, Fulton, 1,117; Insane Hospital, St. Joseph, 1,407; Insane Hospital, Nevada, 1,246; Insane Hospital, Farmington, 574; City of St. Louis Insane Hospital, 628; Feeble Mind Colony, Marshall, 416; Girls' Industrial School, Chillicothe, 263; Boys' Training School, Booneville, 522; State Penitentiary, Jefferson City, 2,125. In 1908 the Board of Charities and Corrections visited the poorhouses of the State with a view to improving conditions therein. As a result, in many counties new and modern buildings have been erected. The charitable and penal institutions of the State were, in 1908, in excellent condition.

POLITICS AND GOVERNMENT. There was no session of the State Legislature in Missouri in 1908. A number of important judicial decisions affecting recent legislation in the State were made during the year. On Jan. 20, the law forbidding transfer of suits from State to Federal courts, passed by the Legislature of 1907, was declared to be unconstitutional. On Jan. 27, a decision was handed down by the Supreme Court declaring unconstitutional the law requiring free transportation for shippers of live stock. On Feb. 29, the State officials were enjoined from enforcing the law against high insurance salaries, passed in 1907. The local option law of the State was upheld as constitutional by a de-

cision rendered on March 17. The constitutionality of the primary law was attacked, and on April 14 the courts handed down the opinion that the law was constitutional. The Supreme Court on June 6 held the eight-hour train dispatchers' law, passed in 1907, invalid. The railroads of the State won a notable victory on March 31, when Judge Smith McPherson, in the Federal Court, decided that he had full jurisdiction over both the maximum freight rate and the two-cent passenger fare cases. Attorney-General Hadley had fought for an amendment denying the right of the Federal Court to enjoin him or interfere with the enforcement of the criminal statute. The railroads agreed to give the two-cent law a test for three months, and asked Judge McPherson to give them that much time to indicate how much the law would affect their revenues. This decision of the court in effect holds that in enjoining the State officers the court is not enjoining the State itself; that the court has a perfect right to go into the question of whether the rates fixed by the statutes are remunerative. On Oct. 3, a grand jury, which had been investigating alleged primary and legislative frauds in St. Louis, returned an official report bringing indictments against 97 persons, of whom 69 were judges or election clerks. At a special election held on June 2, the proposition to substitute the commission form of city government was defeated in Kansas City by about 1,009 votes.

By a unanimous decision handed down by the Supreme Court on Dec. 23, the Standard Oil Company of Indiana and the Republic Oil Company of New York were forbidden ever to do business in the State of Missouri again, and the Pierce-Waters Oil Company, a Missouri corporation, was ordered to dissolve under a condition which will permit the company to be reorganized. Each of the three companies is fined \$50,000. The court found that the companies conspired, first, to regulate and fix prices to retail oil; second, to control and limit the trade in the refined products of petroleum; third, to control and limit and to prevent competition in the buying and selling of these products; fourth, to deceive and mislead the public into the belief that they were separate and distinct corporations, pursuing independently their business as legitimate competitors. The decision is the result of a suit brought by Attorney-General Hadley, later Governor-elect, nearly three years ago. The Attorney-General in his suit alleged that the Standard Oil Company controlled the other two companies, and that they were operating in violation of the anti-trust laws of the State. The decision against the Waters-Pierce Company gave that concern until March 1, 1909, to cut loose from the Standard Oil Company and operate independently.

The Legislature of Missouri in 1907 passed a law, known as the Civic League Act, requiring that all leagues, societies, or committees having as their purpose the investigation of the character and qualifications of candidates or nominees for public office should state in full on what facts they based their reports and give names and addresses of all persons furnishing the information. The law was aimed primarily at the Kansas City Civic League, but also generally against all such organizations as sought to lay before the voters in a non-partisan and dispassionate spirit the facts concerning candidates. A test case was brought by the Secretary and President of Kansas City Civic

League. They contended that the law violated that part of the Missouri Constitution which provides that "no law shall be passed impairing the freedom of speech, and every person shall be free to say, write or publish whatever he will on any subject, being responsible for all abuse of that liberty." This contention was upheld by the Missouri Supreme Court. The Supreme Court declared that this Act "is not confined to forbidding and punishing of the liberty of speech or publication, but undertakes to punish speech or publication without any reference to whether they fall within the legal acceptance of blasphemy, obscenity, sedition or defamation."

CONVENTIONS AND ELECTIONS. At the State elections held on April 7, the Democratic ticket was elected in Kansas City. The issue in the State campaign was the Public Utilities Commission, authorized by the last Legislature and created for the regulation of public service corporations. The local option election in Monroe county on April 7 resulted in a victory for license by 44 majority. This leaves 66 of the 114 counties in the State "dry." On Feb. 13, Livingston county voted in favor of local option by a majority of four to one. The Republican State Convention for the selection of delegates to the National Convention was held at St. Louis on Feb. 27. The delegates chosen were instructed to vote for William H. Taft for President. Herbert S. Hadley was endorsed as candidate for Governor of the State. The Democratic State Convention to choose delegates to the National Convention met at Jefferson City on May 20. Resolutions were unanimously adopted instructing the delegates chosen to support William J. Bryan for President as a unit. Primary elections were held in the State for the first time under the new law on Aug. 4. The Republicans named for Governor the Attorney-General of the State, Herbert S. Hadley, who had won wide reputation from his prosecution of the Standard Oil Company and other corporations. The Democrats, who were forbidden by the State Constitution to nominate Governor Joseph W. Folk for the second time, chose as their nominee William S. Cowherd of Kansas City. On Feb. 23, Governor Folk announced his candidacy as successor to Senator William J. Stone, whose term in the Senate expired in 1909. The campaign for this nomination was very spirited. The result of the election on Nov. 3, which was to decide the Senatorship, was so close that while the first returns indicated that the Democrats had carried the State, a later count gave the Republicans a plurality of about 1000. In the Senatorial primary, Senator Stone defeated Governor Folk by a safe plurality. The carrying of the State by the Republicans was one of the surprises of the campaign, as it is normally reckoned among the Democratic States. The plurality of Mr. Hadley for Governor was over 15,000. The detailed vote of the State and national ticket was as follows: Taft 347,203; Bryan, 346,574; Chafin, 4198; Debs, 15,391; Hadley, 355,932; Cowherd, 340,053.

OTHER EVENTS. The National Bank of Commerce of Kansas City, which was obliged to suspend in 1907, reopened for business on Mar. 30.

STATE OFFICERS: Governor, Herbert S. Hadley; Lieutenant-Governor, in doubt; Secretary

of State, Cornelius Roach; Auditor, John P. Gordon; Treasurer, James Cowgill; Attorney-General, H. S. Hadley; Superintendent Public Schools, H. A. Gass; Adjutant-General, James A. DeArmond; Commissioner of Insurance, W. D. Vandiver—all Democrats except Hadley.

JUDICIARY. Supreme Court: Chief Justice, James B. Gantt; Associate Justices: Division 1, Henry Lamm, Walter W. Graves, Leroy B. Valliant; Division 2, A. M. Woodson, Govon D. Burgess, James D. Fox, John R. Green—all Democrats except Lamm.

The State Legislature of 1909 is composed of 23 Democrats, and 11 Republicans in the Senate, 69 Democrats and 73 Republicans in the House. The State representation in Congress will be found in the article UNITED STATES, under the section Congress.

MISSOURI, UNIVERSITY OF. An institution of higher learning at Columbia and Rolla, founded in 1839. In 1907-8 the attendance was 2,536, and in the autumn of 1908 it was 2,558, distributed as follows: arts, 910; applied science, 667; summer session, 508; education, 315; law, 260; agriculture, 222; graduate students, 137; medicine, 35; and journalism, 60. The University has affiliation with 147 high schools in the State. The College of Agriculture conducts the State soil survey and issues a series of monthly bulletins. The entire income of the University is \$644,000, chiefly from the State. The library contains 108,000 volumes. A new department of journalism was opened in Sept., 1908. A new agricultural building to cost \$100,000 is in course of erection. The President is A. R. Hill.

MITCHELL, DONALD GRANT. An American essayist, known especially (under the pseudonym of "Ik Marvel") as the author of *Reveries of a Bachelor*, died on December 15, 1908. He was born in Norwich, Conn., on April 12, 1822, the son of the jurist Stephen Mix Mitchell (who successfully defended the Connecticut settlers' claim to the Ohio tract, called the Western Reserve), was a pupil in Dr. John Hall's Academy at Ellington, and graduated at Yale in 1841. During the next three years he lived and worked on a farm near Norwich, and incidentally contributed to the *Albany Cultivator*. Then followed two years of residence on the Isle of Jersey, and about a year of travel upon the Continent, which gave him the material for his first volume, *Fresh Gleanings; or a New Sheaf from the Old Fields of Continental Europe* (1847). He then began to study law in New York City, but was compelled by his delicate health to abandon that, and again went to Europe. A sojourn in Paris, during the troubled times of 1848, gave him the matter for his book *The Battle Summer; or Paris in 1848* (1849). The following year he published *The Lorgnette; or Studies of the Town by an Opera-Goer*, satirical sketches; and then came his *Reveries of a Bachelor* (1850) and *Dream Life* (1852), whose graceful literary style, delicate imaginative quality, and gentle and genial philosophy made their author famous and beloved by readers of such literature. Less widely read, very likely, yet no less gracefully expressed, and of better literary quality, withal, is his writing about farming and gardening, especially in his two volumes *My Farm at Edgewood* (1863) and *Wet Days at Edgewood* (1865), wherein we have a happy blending of the practical knowledge of the gentleman farmer, with the

attitude toward agriculture of the sympathetic student of the best literature on that subject.

Mr. Mitchell was United States Consul at Venice from 1853 to 1855, and while there collected material for a history of the Venetian Republic, which remained unwritten. In 1855 he bought his country place, Edgewood, where he passed the remainder of his life, writing about farming and landscape gardening, and doing much skilful and effective work in the latter profession, as his own grounds and the City Park, at East Rock, New Haven, bear witness. Besides the volumes already mentioned, his publications include: *Fudge Doings* (1855); *Seven Stories with Basement and Attic* (1864); *Rural Studies* (1867); *Dr. Johns* (1866), reminiscent of Dr. John Hall, whose school he attended at Ellington; *About Old Story Tellers* (1878); *Daniel Tyler* (1883); *The Woodbridge Record* (1883); *Bound Together* (1884); *Out-of-Town Places* (1884); *English Lands, Letters and Kings* (1889); and *American Lands and Letters* (1897).

MITCHELL, SAMUEL CHILES. An American educator. He was born in Coffeerville, Miss., on Dec. 24, 1864. He graduated at Georgetown (Ky.) College in 1888. He was professor of history and Greek at Mississippi College during 1889-91; of Latin at Georgetown College during 1891-95; and of history at Richmond College during 1895-1908. In 1908 he became president of the University of South Carolina.

MÖBIUS, KARL AUGUST. A German zoologist, died on Apr. 26, 1908. He was born in Eilenburg on Feb. 7, 1825, studied natural history in Berlin under Ehrenberg and Johannes Müller, and in 1853 became assistant to Professor Lichtenstein, then director of the Zoological Museum in Berlin, through whose influence he got a teaching position in Hamburg. In 1868 he was made professor of zoölogy at Kiel, where he made an especial study of marine animals, with results set forth in *Die Fauna der Kieler Bucht* (2 vols., 1865-73), in the preparation of which he was assisted by H. A. Meyer. He also made important observations and collections in Mauritius, the Seychelles, and elsewhere. He was especially interested in the establishment of the Kiel Zoological Gardens, which were completed in 1880. In 1887 he became director of the new Zoological Museum at Berlin, a position he retained until 1905. He was president of the fifth International Zoological Congress, at Berlin, in 1901. His publications include *Die echten Perlen* (1857); *Neue Seeesterne* (1859); *Die Auster* (1877); *Die Fische der Ostsee* (1833), and *Aesthetische Beurteilung der Säugetiere* (1900).

MODERNISM. See ROMAN CATHOLIC CHURCH, and FRANCE and AUSTRIA-HUNGARY, sections on *History*.

MOHMAWDS. See INDIA, *History*.

MONTANA. One of the Northwestern Division of the United States. Its area is 146,572 square miles. The population, according to Federal estimate, was, in 1908, 323,655.

MINERAL PRODUCTION. The aggregate value of the mineral products of the State in 1907 was \$60,663,511, which was a considerable decline from the value of the product in 1906, which was \$74,126,567. Of this reduction in values the most striking was in the production of copper, which in 1907 was \$44,852,758 from 224,263,789 pounds, while in 1906 it was \$56,877,341

from 294,701,252 pounds. The value of the silver produced decreased from \$8,027,072 in 1906 to \$7,345,500 in 1907. The quantities for the respective years were 11,980,705 and 11,129,600 fine ounces. Clay, too, showed a decreased production in 1907 as compared with the preceding year. In the former year 167,987 fine ounces were produced, valued at \$3,472,600, while in 1906 the production was 216,188 fine ounces, valued at \$4,469,014. There was a small increase in the production of coal in 1907 over the amount produced in 1906. In the former year there were produced 3,907,082 short tons, valued at \$2,016,857, while the production in 1906 was 3,240,357 short tons, valued at \$1,829,921. Other mineral products of the State are lime, lead, sand and gravel, stone, and zinc.

The metal output of the State in 1908 is not likely to show great increase over that of the preceding year, considering the unfavorable conditions at the close of 1907 and during the preceding three months. The largest reduction plant in the State, the Washoe smelter, Anaconda, was closed during this time, and in June the smelter at Great Falls was badly damaged by floods in the Missouri River, which caused the cessation of operations during three months. Several small copper and lead plants were under construction during the year. The Director of the Mint estimates the gold production of the State in 1908 as valued at \$3,322,551, against \$3,472,600 in 1907; and the production of silver as 11,518,913 fine ounces, against 11,129,600 in 1907. It is estimated that the coal production of the State in 1908 did not exceed 60 per cent. of that of 1907. This decline was caused by the business depression and by an oversupply of fuel mined during the summer and early fall of 1907. The production of copper in 1908 was 255,446,447 pounds.

AGRICULTURE AND STOCK RAISING. The acreage, production, and value of the principal farm crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 94,000 bushels, valued at \$85,000 from 4,000 acres; spring wheat, 3,703,000 bushels, valued at \$3,185,000 from 153,000 acres; oats, 10,566,000 bushels, valued at \$5,177,000 from 254,000 acres; barley, 875,000 bushels, valued at \$534,000 from 25,000 acres; rye, 40,000 bushels, valued at \$27,000 from 2,000 acres; potatoes, 2,760,000 bushels, valued at \$1,932,000 from 20,000 acres; hay, 1,050,000 tons, valued at \$8,768,000 from 525,000 acres; flaxseed, 104,000 bushels, valued at \$104,000 from 9,000 acres. The oat crop in 1908 shows a decrease from that of 1907, which was 11,760,000 bushels. In the production of hay there was a considerable increase over the crop of 1907, which was 850,000 tons. Potatoes, too, showed an increase over the crop of 1907, which was 2,700,000 bushels. The acreage in flax showed a decided decrease. In 1907 34,000 acres were given to this product, while the crop was 436,000 bushels. The increase in agricultural development in recent years is due largely to the irrigation improvements carried on in the State by the United States Reclamation Service. (See IRRIGATION.) The numbers of farm animals on Jan. 1, 1909, were as follows: Horses, 304,000; cattle, 980,000; sheep, 5,634,000; swine, 68,000. The increase in dairy cattle has been large since 1900. Sheep and swine have also increased materially. The wool clip for 1908 was

32,200,000 pounds, valued at \$5,911,920, giving the State first rank in the production of wool and the number of sheep.

MANUFACTURES. The special census of 1905 showed manufactured products valued at \$66,415,400, as compared with \$52,744,900 in 1900. Most of the value was represented by the smelting and refining of copper. (See paragraph *Mineral Production*.) Other industries and the values of their products were: Lumber and timber products, \$3,024,674; flour and grist mill products, \$2,003,000; malt liquors, \$1,731,700; and railway shop works, \$1,572,400. The values credited to leading centres were: Anaconda, \$28,581,500; Great Falls, \$13,292,000; Butte, \$2,132,872; and Helena, \$1,309,746.

EDUCATION. In 1906, the last year for which statistics are available, the number of children in the State of school age, 6 to 21, was 72,498. Of these 48,744 were enrolled in the public schools and 34,738 were in daily attendance, while 5,000 were enrolled in private schools. The number of school districts in which some school was held was 833. There were 25 district high schools and 15 county high schools. There were in the State 228 men teachers, with an average salary of \$87.30 per month, and 1573 women teachers, with an average monthly salary of \$56.07. The course of study was revised for 1907-8, following the introduction of a new series of textbooks.

FINANCE. The report of the State Treasurer for the fiscal years ending Nov. 30, 1907 and 1908, showed a balance on hand Dec. 1, 1906, of \$840,941. The receipts for 1907 and 1908 were \$6,343,012. The disbursements for 1907 were \$3,087,105 and for 1908 \$2,691,790, leaving a balance on hand Nov. 30, 1908, of \$564,116. The chief receipts were: from the General Fund, \$1,112,299; from School Income, \$454,321; from the Permanent School Fund, \$214,385; and from the Capitol Building Interest and Sinking Fund, \$152,743 for 1908. The chief expenditures in 1908 were on account of the General Fund, \$1,022,662; Permanent School Fund, \$271,420; School Income Fund, \$463,702; and School of Mines Permanent Fund, \$152,221.

POLITICS AND GOVERNMENT. There was no session of the State Legislature in 1908. On Feb. 1, Governor J. K. Toole announced his resignation from office, to take effect Apr. 1, on account of ill health. The sixteen-hour railway law passed by the legislative session of 1907 was declared constitutional by the Supreme Court on Feb. 25. On Jan. 3, Judge Hunt of the United States Court, declared Joseph Shannon, former member of the Legislature from Butte, and President of the State organization of the Western Federation of Miners, William Cutts of the Carpenters' Union, and A. R. Edwards, a prominent labor leader, guilty of contempt of court for violating an injunction restraining interference with the Rocky Mountain Bell Telephone Company, by the forcible ejection of two non-union workmen from the company's property in Butte. Judge Hunt declared that the laws of the country were paramount and must be obeyed. He said that while he believed in the right of labor to organize, it must obey the orders of the court, which stand as laws until reversed. The men were sentenced to jail for three months each, and in addition, Cutts and Edwards were fined \$200 and \$100 respectively. On Mar. 12, David Pratt of Billings, a prominent stockman and politi-

cian, pleaded guilty in the Federal Court to unlawful enclosure of the public domain and was sent to jail for forty-eight hours and fined \$250. On July 4 Anaconda celebrated the 25th anniversary of the breaking of ground for the building of the city and its smelters.

CONVENTIONS AND ELECTIONS. The Republican State Convention for the selection of delegates to the National Convention met at Butte May 14. The delegates chosen were instructed to vote for William H. Taft for President. The Democratic State Convention met on July 1, and chose delegates instructed to vote for William J. Bryan for President. The Republican State Convention for the nomination of State officers met at Helena on September 17. Edward Donlan of Missoula was nominated for Governor. The Democratic State Convention met at Anaconda on Sept. 8 and nominated Edwin L. Norris for Governor. The result of the election on Nov. 3 was very close in the State. William H. Taft received a plurality of about 3,000 votes over William J. Bryan (Taft, 32,333; Bryan, 29,326; Debs, 5,855; Chafin, 837; Hisgen, 443). Norris, Democrat, was elected Governor, but all the other State officers elected are Republicans.

OTHER EVENTS. The resumption of the operation of the mines and smelters in Butte and Anaconda, belonging to the Amalgamated Copper Company, on Mar. 1, caused great rejoicing in that city and in Anaconda. These plants, together with the various sawmills, coal mines, and quarries throughout the Northwest, employ an aggregate of 20,000 persons. In Anaconda, the Washoe smelters of the company employ 3,000 men, and are the sole support of the city. The schedule of wages prevailing before the suspension in 1907 remains unchanged. The Iron Mountain drainage tunnel, one of the most remarkable works in engineering ever undertaken, was completed on Mar. 12. This tunnel had been under construction for more than ten years and is more than a mile long. On Apr. 15, Hauser Lake Dam in the Missouri River, 20 miles from Helena, burst on account of floods, and caused a loss of more than \$500,000. The power generated by this dam was used by the Butte mines and Washoe smelters at Anaconda. In the early part of June floods washed away portions of the railroads entering Butte, and for a time the city was completely cut off from train service with the outer world. The floods caused a suspension in several of the large works of the State. Losses exceeding \$1,000,000 were caused by forest fires, which broke out in Big Timber, the county seat of Sweet Grass County, on Mar. 13. Twenty-two persons were killed, as many more injured, and a passenger train and half a freight train crushed into splinters as the result of a collision on Sept. 25 on the Northern Pacific Railroad near Youngs Point, 4 miles from Park City. On Nov. 3 fire destroyed the new town of Taft on the St. Paul Railroad, west of Missoula. This was the second time in a few months that this town was destroyed by fire.

STATE OFFICERS: Governor, Edwin L. Norris, Dem.; Lieutenant-Governor, William R. Allen, Rep.; Secretary of State, A. N. Yoder, Rep.; Treasurer, Elmer E. Esselstyne, Rep.; Auditor, H. R. Cunningham, Rep.; Attorney-General, A. J. Galen, Rep.; Adjutant-General (to be appointed); Superintendent of Education, W. E. Harmon, Rep.

JUDICIARY. Supreme Court: Chief Justice, Theo. Brantley, Rep.; Justices, Henry C. Smith, Rep., William L. Holloway, Rep.; Clerk, John T. Athey, Rep.

The State Legislature of 1909 is composed of 17 Republicans and 10 Democrats in the Senate, 33 Republicans and 38 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES, under the section Congress.

MONTENEGRO. An independent principality of the Balkan peninsula. Area, 3,506 square miles; population, about 250,000. About 20,000 Montenegrins live in adjacent countries. Greek-Orthodox number 223,500; Roman Catholics, 12,500; Mohammedans, 14,000. Cetinje, the capital, has 4,500 inhabitants; Podgoritz, 10,000; Dulcigno, 5,100; Niksic, 3,900; Antivari, 2,300. Education is free and compulsory. Elementary schools are supported by the government. At Cetinje there is a theological seminary, a boys' gymnasium, and a girls' gymnasium supported by the Empress of Russia. Land is held either in domestic communism or in small private freeholds. Agriculture and grazing are the principal occupations. A large part of the country is uncultivable. Maize, barley, buckwheat, oats, potatoes, wine, olives, and tobacco are cultivated. The manufacture, sale, and export of tobacco have, since 1903, been the monopoly of an Italian syndicate—the privilege having been granted for 25 years. Imports and exports in 1906 amounted to 5,203,700 and 1,705,000 kronen respectively (1 krone = 20.3 cents). The trade is mainly with Austria, imports from which were 3,582,500 kronen, and exports to which, 1,700,000 kronen. Turkey comes next, with 1,410,700 and 162,500 kronen respectively. There are good carriage roads. The first railway, 100 miles long, is being constructed from the port of Antivari to Niksic, in order to reach the iron mines which are being opened. There are 528 miles of telegraph line.

A Constitution was granted by Prince Nicholas I., who has reigned since 1860, on Dec. 19, 1905. The unicameral National Assembly consists of 74 members, of whom 62 are elected by universal suffrage, and 12 are members *ex officio*. The latter include the Greek-Orthodox Metropolitan, the Roman Catholic Archbishop, the Mohammedan Mufti, six high State officials, and three generals appointed by the Prince. The ports are closed to the ships of war of all nations. The administration of the maritime and sanitary police on the coast is in the hands of Austria. The budget for 1907 estimated the revenue and expenditure, respectively, at 2,980,000 and 2,888,893 kronen. The public debt stood in 1907 at 1,657,192 kronen.

The army consists of a tribal or patriarchal militia, to which each household contributes a man. There are 2 battalions of infantry and 2 battalions of artillery maintained for instruction purposes, about 2800 men passing through the three infantry and two artillery courses each year. The only additional training they receive is that given in the 10 annual village musters for rifle practice. Mohammedans have a separate organization and would probably refuse to fight other Mohammedans. There are 58 battalions of infantry and 12 batteries of artillery, nominally organized into 11 brigades. There is no cavalry. The total fighting strength

is between 50,000 and 60,000 men, of which probably one-half could be put into the field.

HISTORY. By an edict of Nov., 1905, a parliamentary government was instituted through the creation of a Skupschtina to consist of 76 members—56 elected by the military districts, 6 by the principal towns, and 14 *ex officio*. In April, 1907, a transition Ministry was appointed under M. Tomanovich, for the purpose of arranging a coalition between the parties, whose struggle had brought the preceding Ministries quickly to an end. The Skupschtina was dissolved in June, 1907, and the elections of Oct. 31 rendered the Skupschtina entirely Conservative in character. In December it was reported that a plot had been formed against the government with the design of killing members of the royal family and of the Cabinet. It was laid at the door of the National Democratic Party, Premier Tomanovich charging them directly with the crime. The trial for treason was begun at Cetinje on May 25th, and some sensational testimony was brought out, a Bosnian journalist having testified that the Crown Prince had been concerned in the manufacture of bombs which were to be used against Prince Nicholas. Sentence was rendered on June 27th. Six of the persons were condemned to death, 3 to imprisonment for life, 27, among whom were 5 ex-Ministers, to from 6 to 20 years' imprisonment, 13 to from 2 to 10 years' detention, and 2 were discharged.

The paramount interest of the year centred in the course pursued by Montenegro after Austria's announcement of her annexation of Bosnia and Herzegovina. Immediately on the publication of that announcement, Prince Nicholas, in a public manifesto, expressed his grief at the annexation, and declared that since the Treaty of Berlin had been so grossly violated Montenegro was no longer bound by the restrictions which the treaty imposed on her liberty of action. For an account of subsequent events and their relation to general European affairs, see the article BALKAN QUESTION.

MONTSERRAT. An island of the West Indies, one of the Leeward Islands (q. v.), of which it constitutes a Presidency. Area, 32 square miles; population (1906), 12,215. The lime and other fruit trees are largely grown. There is a flourishing fruit and vegetable preserving industry. The imports in 1907-8 amounted to £32,756; the exports, £35,183, including 365,000 pounds of sea island cotton, valued at £27,850. The revenue in 1907-8 was £10,233; the expenditure, £8,016; and the public debt, £11,100. The Commissioner in 1908 was Lieut-Col. W. B. Davidson-Houston.

MORAVIANS, called also the UNITED BRETHREN (Unitas Fratrum) and the MORAVIAN CHURCH. An evangelical denomination which had its beginning in Bohemia and Moravia among followers of John Huss. It was established in America in 1875, in Georgia, where a colony of Moravians had settled, but five years afterward removed to Pennsylvania, where they built the towns of Bethlehem and Nazareth. The Moravians had in 1908 a total number of 17,820 communicants, of which the American Moravian Church North included 13,986 and the American Moravian Church South 3,834. There were 119 churches and 139 ministers. In the Northern Province there are 41 Missionary societies, with a membership of

2956. In the Sunday schools of the church there were in 1908 14,115 scholars and 1524 officers and teachers. Funds are maintained for retired ministers and widows of ministers. The Church sustains missions in Africa, Alaska, Canada and Bohemia. A Home for Lepers is supported in Jerusalem. Among the educational institutions under the auspices of the Moravians are the Moravian College and Theological Seminary at Bethlehem, Pa., Moravian Parochial School for Boys, the Moravian Seminary for Girls, both at Bethlehem, Pa.; Linden Hall Seminary for Girls at Lititz, Pa.; and Nazareth Hall for Boys at Nazareth, Pa. The official organ of the Church is *The Moravian*, published at Bethlehem, Pa. The Provincial Synod of the American Moravian Church North was held at Lititz, Pa., in September, 1908. The next Synod of this branch will be held in 1913. The General Synod of the Church throughout the world will be held at Herrnhut, Saxony, Germany, in June, 1909.

MOROCCO. An independent country of north-west Africa. Area, 234,000 square miles; population, about 8,000,000, including 4,000,000 Berbers, 3,600,000 Arabs and Moors, from 150,000 to 300,000 Jews, and 250,000 negroes and mixed. The capitals are Fez, 140,000 inhabitants; Morocco, 50,000; and Mequinez, 25,000. Tangier, the principal port, has about 25,000 inhabitants; Casablanca, 30,000; Rabat, 30,000; Mogador, 22,000; Safi, 10,000; Mazagan, 10,000; Larache, 10,000.

PRODUCTION, COMMERCE, ETC. Agriculture and stock-raising are the principal industries. The native manufactures include leather, pottery, textiles and carpets, copper and brass goods, silver filigree, etc. There are no reliable and complete statistics of foreign commerce. According to the French Creditors' Commission the total oversea imports and exports in 1907 amounted to about \$8,430,000 and \$6,400,000 respectively, while according to another statement the total foreign trade of Casablanca, Rabat, Mazagan, Safi, and Mogador alone amounted to nearly \$12,390,000. For 1906 the total value of imports was given as \$14,200,000, and of exports, \$18,276,000. The principal articles of imports are tea, rice, wines, beer and spirits, coffee, silk goods, woollens, paraffin candles, wood and iron manufactures, and petroleum. The principal exports are wool, sheepskins, goatskins, cattle, wax, eggs, almonds, and rubber. There are no railways. The British, French, German, and Spanish governments maintain post offices of their own at the ports. The district of Casablanca is now occupied by the French. The immediate effect of the bombardment and pillage of Casablanca in Aug., 1907, was the destruction of the native shops and stores and of the vast Arab hut quarter to the west of the town. But in a few months new shops, hotels, cafés, and restaurants had sprung up. The European population, which had previously numbered about 700, had reached by the middle of 1908 nearly 2,700, not including the troops. The holders of the new shops are mostly Frenchmen and Spaniards. One speedy result of the foreign occupation was the improvement of the roads—first those in the town, then the country roads. The lighting and sanitary condition of the streets have greatly improved, funds to meet the initial expense

having been obtained from the sale of unclaimed loot dropped by the Arabs in their flight.

GOVERNMENT, ETC. The present Sultan is Mulai Hafid, who rose against his brother Mulai Abdel-Aziz in 1907 and was recognized by the Powers in 1908. Persons under the protection of foreign consuls are exempted from the jurisdiction of native judges. The revenue derived from customs is about \$2,000,000 a year. Internal taxes are collected without any system, each tax-gatherer having to deliver a certain sum, irrespective of the amount collected. The amount of the public debt is not known. A French loan of 62,000,000 francs in 1904 is secured by the customs. The army consists of about 3000 slave soldiers and about the same number of negro cavalry, constituting a sort of guard for the Sultan and quartered at his capitol wherever it may be located. There is also the mounted police force of 8000 to 10,000, and a few unorganized batteries of artillery numbering about 800 men. In addition to this, irregular cavalry and infantry could be mobilized during a war to the number of 40,000.

HISTORY.

RÉSUMÉ. At the conference of the Powers at Algeiras Jan. 16 to April 7, 1906, France and Spain were commissioned to maintain order on the Moroccan coast. The two mandatory Powers were strictly limited in their authority. The Conference recognized the sovereignty of the Sultan and left his territory intact. Freedom of commerce on equal terms to foreign nations was guaranteed. Order in the eight Moroccan ports was to be maintained by a police force under French and Spanish officers, but recruited from the Moors and subject to the Sultan's authority. Certain reforms were demanded of the Moroccan government by the Powers. The organization of the police force was delayed by the prevalent internal anarchy, and meanwhile events occurred which called for the active interference of France and Spain (1907). In the first place a French pioneer, Dr. Mauchamp, was murdered by the natives at Marakesh. The French troops thereupon seized and occupied the town of Ujda, near the Algerian border, and declared their intention to remain there until guarantees of security were given. In holding Ujda France was within her rights, the power to protect her Algerian frontier having been conceded to her by treaties of long standing. A more serious event occurred in July, 1907, when, in accordance with the agreed programme for reform, the French began to assume control of the customs of the ports. The outbreak occurred at Casablanca on the Atlantic coast, where the appearance of the new customs officers angered the tribesmen, who on July 30 attacked a number of European laborers in the quarries, killing them and mutilating and burning their bodies. The tribesmen then raided the town and, after attacking the few European residents, retired with much plunder. French and Spanish warships were immediately ordered to Casablanca. Forces were landed on Aug. 4, 1907, and were fired upon by the tribesmen. A bombardment of the town followed. On Aug. 7 an expeditionary force of French and Spanish under Gen. Drude occupied Casablanca. Conflicts with the tribesmen took place on Aug. 28 and Sept. 2, 1907. The enemy were repulsed by the machine guns and the fire of the warships. In September terms of peace were submitted, and some of the tribesmen accepted them. A state of war still existed at the close

of the year, and the outcome was undetermined. Meanwhile matters had been complicated by the appearance of a rival Sultan in the field, in the person of Mulai Hafid, a brother of Sultan Abd-el-Aziz. Mulai Hafid gained early a large following, and in certain parts of the country was accepted as Sultan. In the autumn Abd-el-Aziz removed his court from the capital, Fez, the most fanatical of the Moslem cities, to Rabat. He had asked a loan from France, but it had not been granted. General Drude, whose course seemed lacking in energy, was replaced by General d'Amade, who began an aggressive campaign against the tribesmen. Such was the situation at the beginning of 1908.

THE EVENTS OF THE FIRST THREE MONTHS. On Jan. 11, 1908, Mulai Hafid was proclaimed Sultan at Fez, in place of his brother, who was deposed by the Ulema, or religious authorities. This event occurred almost simultaneously with the beginning of a more active military policy by the French. Gen. d'Amade sent out flying columns from Casablanca, and sought to extend his authority over the entire surrounding province of Chaouiya. A disaffected Sheik brought about a *coup d'état* at Fez which led to the deposition of Abd-el-Aziz, whose hold on the people had been weakened by his supposed subservience to the Christians. He had some months before sent a letter to the Ulema asking whether a Moslem ruler might, if he could not enforce the obedience of his own subjects, call to his assistance a Christian Power. This, in connection with the advance of the French, was said to have contributed to his deposition.

The forward movement of Gen. d'Amade continued during February; but success was difficult, owing to the comparatively small forces at his disposal and to his policy of dividing it into detachments. The tribesmen, however, were severely punished in these encounters. In the engagements of Feb. 17-18 around Abdul Kerim the French loss was considerable—57 killed, of whom 6 were officers, and 217 wounded—and some alarm was expressed by the French newspapers lest the French force was too small to cope with the tribesmen. The army was reinforced, but not heavily. On March 8 an engagement at M'Karto resulted in the routing of the Moors with severe loss. In March several tribes submitted. Gen. Lyautey, commander-in-chief in Algeria, was sent with M. Regnault, the minister to Morocco, on a mission of inspection. He left Casablanca on March 25 for the kasbah of Mediouna, and found that fertile region almost entirely deserted by its inhabitants. The chiefs there submitted and the tribesmen accepted a regular administration. On the next day he advanced to Bu Reshid, where the pacification became complete. The Moors were said to have been surprised by the clemency of the French invaders, being used to the ravages of the sherifian troops, even in their own country, and their chief fear seemed to be the restoration of the old régime. Meanwhile the French force had been considerably reinforced. When Gen. d'Amade took command they numbered 8400; at the end of February they had increased to 10,000, and afterwards additional troops were sent, making a contingent of about 4000. Thus the total strength was about 14,000, with 16 field guns, 6 mountain guns, and 20 mitrailleuses. Down to March 8, counting the casualties of the operations on the Algerian frontier, there were 99 killed, including 9 officers; 311 wounded, includ-

ing 12 officers; on the fleet 1 officer and 13 men were killed and nearly an equal number wounded. The French government had asked of the Chamber 16,121,425 francs for the war, but this did not cover the full cost to that time, which was estimated at 20,000,000 francs.

During March the region of the Madraka was occupied and practically reduced. While the French forces were still engaged there, it was learned early in April that a part of Mulai Hafid's army was advancing toward Settât, and that some of the troops of the Chaouiya territory were showing signs of revolt. Leaving 3000 men among the Madraka, Gen. d'Amade marched with the remainder, about 4000, upon Settât, and prevented the rising of the tribes. At that time the region of the French occupation was comprised within a curved line at about 50 miles from Casablanca, including as its main points Settât, Madraka, Fedala, and Bu Zenika. On April 16 the French camp at Menabba was suddenly attacked by a large body of the tribesmen who had marched overnight and driven in the outposts. The attack was so sudden that the French were obliged to fight hand to hand, and they were meanwhile harassed by the fire from a neighboring height. A company of the Foreign Legion, however, scaled the height and dislodged the Moors, who thereupon retreated, pursued by the French. The latter sustained considerable loss, 33 killed, including 1 officer, and 90 wounded, including 8 officers. The news caused some alarm in France, and occasioned in the press adverse comments on the French military tactics which had not prevented this surprise and which had not attacked the enemy first, although they were known to be in the neighborhood. In May there was further fighting against the Madraka, and the tribesmen were driven in the direction of Gaer, the French loss being slight. Severe fighting took place on the Algerian border. In an engagement between the Moors and the command of Gen. Vigy in southern Oran, May 12-13, the French lost 13 killed, including 3 officers, and 65 wounded, including 7 officers.

Meanwhile General Lyautey had returned from his tour of inspection and been relieved from his duties. The government, however, which was sharply criticised in some quarters for depriving him of his authority and for having interfered with him in the performance of his task, soon placed him in charge of southern Oran with enlarged powers. Meanwhile it was apparent that the strength of Mulai Hafid was increasing, and that soon the greater part of the country would declare for him. But little aid had been rendered by the French to Abd-el-Aziz, and their presence was even a source of weakness to him by compromising him in the eyes of the natives. While marching from Rabat toward Fez in May, his army was surrounded by hostile tribes in the territory of the Beni-Hassan, and the communications being cut off, a large part of it deserted and the remainder went back toward Rabat. Mulai Hafid meanwhile had sent a mission to Europe to ask for recognition. The embassy was informed by the Berlin Foreign Office that the German government could not treat with an authority not recognized by international law. An unofficial representation, however, was accorded to it. The Foreign Office declared that it would at once consider whether there was any occasion to communicate with the French government on the question of recognition. There

ABD-EL-AZIZ
THE DEPOSED SULTAN

MULAI HAFID
PROCLAIMED SULTAN, 1908

was some adverse comment in the French press on the fact that the German government had extended this measure of courtesy to the embassy. On June 7, Mulai Hafid entered the holy city at Fez, and immediately gave evidence of his national spirit by destroying the motley collection of automobiles, bicycles, printing presses, and other European contrivances, with which Abd-el-Aziz was wont to amuse himself. He also showed signs of a vigorous and arbitrary policy by promptly setting aside the agitator who had proclaimed the downfall of Abd-el-Aziz, and by restoring the tax which the previous Sultan had given up. The French policy was apparently confined to the protection of the South Algerian frontier and of the coast towns where European residents might be in danger, to retaining their grasp on the region around Casablanca, to the organization of the international police force, and to the observance of strict neutrality between the rival sultans.

OVERTHROW OF ABD-EL-AZIZ. In spite of these successes of Mulai Hafid, his rival was not yet finally overthrown, but that result was achieved in August. On July 12 Abd-el-Aziz started from Rabat toward Marakesh, with the design of extending his authority over the south, where it was said that the tribesmen were turning against his rival, to whom at first they had submitted. His advance was retarded by the French, who forbade him to cross the territory occupied by their troops. On Aug. 21, while in the neighborhood of Marakesh, his army was completely dispersed, not by the enemy, but owing to the treachery of his soldiers, who took advantage of a skirmish to throw the lines into disorder and scatter the entire force. The camp was plundered and the soldiers scattered in all directions. The Sultan with only a handful of men succeeded with great difficulty in escaping, and fled for protection to the French at Scttat.

Meanwhile Mulai Hafid had been proclaimed at Tangier. The German government sent a note to the Powers advising his immediate recognition, a course which provoked much adverse comment in France, who insisted that the recognition should not be accorded until the Powers had received guarantees that the Act of Algieras would be regarded and certain other conditions observed. (See FRANCE, paragraphs on *History*.Q) Another difficulty arose with Germany over the seizure by French officers of three German deserters from the Foreign Legion in Casablanca in November. On receiving the German protest the French government offered to refer the matter to arbitration, but Germany required first an expression of apology. It was refused by France, who offered, however, a simultaneous apology by both nations, and this compromise was accepted by Germany. See FRANCE and GERMANY, paragraphs on *History*.

France and Spain having signified to the Powers what the necessary conditions of recognition were, Germany consented, and there was no further trouble over the affair during the year. On Dec. 5 Mulai Hafid announced his agreement to the conditions which France and Spain imposed, in accordance with the principles laid down at Algieras. Among these conditions was the full responsibility for the public debts left by the previous Sultan. This laid a heavy burden on the new ruler, for the Maghzen's debts were estimated at \$30,000,000, to say nothing of some outside claims, and apparently the only unpledged assets were the remainder of the customs

dues. At the close of the year the deposed ruler was living quietly at Tangier, apparently reconciled to his fate. In September and October many French officers were withdrawn.

OTHER EVENTS. In May the mixed international police force for which the Act of Algieras had provided, but which had been organized very slowly, began its duties at Tangier. A noteworthy event of the year was the final surrender of Kaid Sir Harry MacLean, by Raisuli, who, it will be remembered, had seized him in July, 1907, and held him for ransom. In spite of the efforts of the British government, Raisuli refused to let him go, but on Feb. 6 released him in exchange for prisoners, and for the payment of £20,000, of which £5000 was to be given him at once, and the remainder after three years, on condition of good behavior. Raisuli and twenty-eight of his relatives became protected British subjects.

MOULTON, LOUISE CHANDLER. An American author, died on Aug. 10, 1908. She was born at Pomfret, Conn., on April 10, 1835. Her first volume of stories, *This, That, and the Other*, published in 1853, was immensely successful. She married William Moulton, a Boston publisher, in 1854. From 1870 to 1876 she was Boston literary correspondent of the *New York Tribune*, and from 1887 to 1892 she contributed a weekly literary letter to the *Boston Sunday Herald*. She is especially celebrated as a writer of stories for children. Her most notable books include: *Bed-Time Stories* (1873); *Some Women's Hearts* (1874; new ed. 1888); *Swallow Flights* (1878; reprinted 1892); *Random Rambles* (1881); *In the Garden of Dreams* (1896); *In Childhood's Country* (1896); and *At the Wind's Will* (1899).

MOUNT HOLYOKE COLLEGE. An institution of higher education for women, at South Hadley, Mass. founded in 1837. In the autumn of 1908 the attendance was 747. The faculty numbers 89. The 71st anniversary of the founding of the college was celebrated in Nov., 1908. A music building containing a concert hall, a library, and teaching and practice rooms is in process of erection, and was to be ready for use early in 1909. A president's house was also being built. The equipment includes seven buildings for instruction and eight for residence buildings. The endowment is \$201,000 and the income in 1908, \$226,992.58. There are 39,300 volumes in the library. The President is Mary E. Woolley.

MUNICIPAL GOVERNMENT. The conditions and tendencies in municipal affairs prevalent in 1907 continued in 1908. Particularly was this true of government by small commissions, as installed in Galveston, Tex., and Des Moines, Ia., in place of the large city council still commonly found. The movement for better municipal accounting and for the publication of comparable municipal statistics also gained

much new ground in 1908. Both direct legislation and the direct primary system progressed during the year.

GOVERNMENT BY COMMISSION. The unusual conditions brought about by the Galveston Flood were said to have given rise to municipal government by commission in that city, where five men administer the offices of the city. It might well have been noted that a precedent had been established years before in the creation of a commission of three to administer the affairs of Washington and the District of Columbia. The satisfactory results achieved by this District Commission may have encouraged the people of Galveston, Tex., to adopt the commission plan in their dilemma and the success of the plan at both Washington and Galveston has furthered its adoption in many other places. A half dozen or more other Texas cities, including San Antonio, Ft. Worth and Houston, in 1908 had commission governments, as had also Des Moines and Cedar Rapids, Iowa, Leavenworth, Kansas, Lewiston, Idaho, and Haverhill and Gloucester, Mass. South Dakota in 1907 authorized all its cities to adopt the commission plan, and at the same time that State made possible the initiative and referendum, with only five per cent. or one voters required on the petitions for a popular vote on any desired subject.

MUNICIPAL EXPERTS. The need for experts in the conduct of municipal affairs had been recognized to some extent for many years. At first this recognition was confined to the legal and engineering fields, and even there was applied chiefly in emergency work, like the construction of water-works, the framing of a charter, or the conduct of a case in court. Of late, the services of the expert have been extended to almost every branch of the municipal service, and to operation as well as to constructional work. But much remains to be done before it becomes generally recognized that expert supervision is required for the proper maintenance and efficient daily operation of a water or sewage filter, a refuse destructor or burner, an electric light plant or the accounting system of a city. Prof. A. Lawrence Lowell, of Harvard University, discussed municipal experts before the 1908 convention of the National Municipal League. He urged that non-professional representatives of the municipal public ought to direct the experts, and defined the relation of the two as follows: "The expert is expected to make his public work his career. He should devote his whole time to it, receive a liberal salary and be protected from removal except for cause. The non-professional is not to manage his department but to see that it is properly managed. He ought not to be expected to give a great deal of time to it, ought to be paid nothing or a much lower salary than the expert, and ought to give an account of his stewardship by coming up for reappointment or election at fixed intervals."

In line with the expert idea, although of a non-official or extra-official character, was the Bureau of Municipal Research, of New York City. During 1908 and previously, this Bureau was an efficient measurer and, in a wholly volunteer manner, had assisted in a number of important investigations of city departments, and was instrumental in starting much-needed

reforms in both the accounting and budget-making systems of New York City. Assistance from the Bureau was asked by a number of cities. The desirability of making the Bureau permanent by substituting an endowment fund for the present short-term subscription method of support was urged during the year.

UNIFORM ACCOUNTS AND REPORTS. Ohio, New York and Iowa have provided a law for uniform financial municipal reports, and also for the compilation and publication of these statistics by a State official. In Ohio, the law required uniform accounts, established and audited by a State department. Massachusetts has provided for the collection and publication of municipal financial statistics by the State. The cities and towns are not required to adopt any stipulated system of accounting, but the returns which each must make to the State must all be on forms prescribed for the purpose, and this tends toward ultimate uniformity of accounts. The essential thing, however, is not that every city and town in a State or in the whole country adopt and follow a single rigid system of accounts, but that the accounts should be so well planned and so intelligently kept as to make it possible to derive from them comparable figures for each branch of the municipal service. Uniformity of accounts is of course a great aid to this end. Each of the four States named published municipal financial statistics for one or more years. The Massachusetts report, issued for the first time in 1908 (by the Bureau of Labor Statistics), contained a valuable analytical introduction. A summary of uniform accounting progress, including many cities throughout the country, outside the four States named, may be found in a special report of the United States Bureau of the Census, *Statistics of Cities Having a Population of Over 30,000, 1906*. This report contains many valuable tables of financial statistics for the 158 cities above the population limit named. The figures given, as well as those in the four State reports already named, follow modifications of the scheme first devised by the Committee on Uniform Municipal Accounts and Statistics of the National Municipal League, which Committee had been at work on uniform accounting for a half dozen years previously. The League schedules were modified somewhat by the Bureau of the Census. The Bureau was coöperating, in 1908, with the various State departments to whom the collection of municipal statistics was entrusted. A notable book on city affairs appeared in 1908. It is entitled, *Problems of City Government*, and was written by Prof. L. Rowe, of the University of Pennsylvania.

MUNICIPAL LEAGUE, NATIONAL. An organization to promote the thorough investigation and discussion of the conditions and details of civic administration, and of the methods for selecting and appointing officials in American cities, and of laws and ordinances relating to such subjects. It was organized in New York in 1894 as a result of the Philadelphia Conference for Good City Government, held earlier in the same year. It comprises 155 affiliated organizations and 1500 individual members. It publishes an annual volume of proceedings which is a valuable reference book to students of municipal problems and to workers along municipal lines. The annual meeting for

1908 was held at Pittsburg, Nov. 16-19, in conjunction with the American Civic Association. The President is Charles J. Bonaparte, Baltimore; Secretary, Clinton Rogers Woodruff, Philadelphia.

MUNICIPAL OWNERSHIP. The change from private to public ownership continued during 1908, but outside of water-works perhaps the rate of change had diminished somewhat with the financial depression following the panic of the previous year and, in some American States, with the increasing regulation of public-service corporations by State commissions. Of the 20 largest cities in the United States, San Francisco is the only one wholly dependent on private companies for its water-supply, and on Nov. 12, 1908, San Francisco voted 6 to 1 in favor of a municipal ownership scheme. In Massachusetts, to take a State which has always been strong for municipal ownership, the remaining private water companies were disappearing so rapidly that all of the 33 cities and all but three of the towns having 8000 population or over owned their works. Of the 185 Massachusetts municipalities having public water supply, only 46 towns, with but 6.2 per cent. of the total population supplied, still depended on private water companies at the beginning of 1908. In Maine, which for many years had only two municipally-owned water-works, the companies operating in the larger places were rapidly being bought out by the cities and towns, under recent State legislation. Many interesting and instructive points in water-works appraisal were developed in connection with the recent Maine purchases. A recent paper by Leonard Metcalf ("Water-Works Valuations and Fair Rates, in the Light of the Maine Supreme Court Decisions in the Waterville and Brunswick Cases," *Proceedings American Society Civil Engineers*, October, 1908) states these points, cites various court rulings on valuation principles and proceedings, contains many useful formulas and tables, and concludes with a valuable list of references to papers on water-works valuations for purchase and for rate-fixing purposes. See WATER WORKS.

MUNICIPAL RESEARCH, BUREAU OF, See MUNICIPAL GOVERNMENT.

MURAVIEFF, NIKOLAI VLADIMIR. A Russian statesman, died in Rome on Dec. 14, 1908. He was born in 1850, and early entered the public service. He was president of the criminal section of the Senate from 1892 to 1894, and in 1894 was appointed Minister of Justice. In this position he rendered valuable service in reforming the administration of justice. He was appointed Russian arbitrator of the Venezuelan claims at The Hague in 1903, and in 1905 became ambassador to Italy. He was originally appointed to negotiate the peace with Japan, but was superseded after a few days by Sergius Witte.

MUSEUM OF FINE ARTS. An institution incorporated Feb. 3, 1870, at Boston. New buildings for the museum were under construction in 1908, and were to be opened in 1909. The estimated cost of these is \$1,533,000. They are situated on the Fenway, Boston. The building, as planned, has a number of department museums, with intervening corridors, loggias for rest and recreation; the ground floor is devoted to offices and to collections compactly installed for students; the main floor is devoted to collections shown to the best advantage for visitors.

All are amply lighted by windows. The Museum School of Drawing, Painting, and Modelling, with about 200 pupils yearly, will occupy a separate structure. Among the most important collections in the museum are collections of the original works of the art of Egypt, Greece, Rome, the Orient, and modern Europe and Asia; the Athenæum heads of George Washington and Mrs. Washington, plaster casts from antique and Renaissance sculpture, and the Morse collection of Japanese pottery. Collegiate courses in the history and observation of fine arts were carried on during the year. The income of the museum is \$110,000, and the annual expenditures about \$75,000. The visitors number about 275,000 annually. The president is Gardner M. Lane; the director, Arthur Fairbanks, and the secretary, Benjamin Ives Gilman.

MUSIC. The year 1908 showed no abatement of the phenomenal activity of musical organizations all over the civilized world. In fact, as regards the production of novelties in every branch of musical composition, the year may safely be said to surpass the record of any previous year. The value of most of these novelties is another story. A remarkable phenomenon is the instantaneous enthusiasm aroused in the United States by Debussy's music, especially by his opera *Pelléas et Mélisande*. While the success of this work here has eclipsed all records made in France, Germany's attitude is one of critical, and even skeptical, aloofness.

The question of salaries paid to operatic stars in the United States, which had been causing uneasiness among European managers for some time past, entered upon a new and critical stage. In order to prevent the depletion of their own opera houses some of the most influential of the Italian and South American impresarios have combined their interests and formed a "Trust Teatrale Italo-Argentino." The main objects are to secure absolute control of new works, and to attract the best artists by offering them practically an all-year contract as against a four or five months' contract in New York. The trust is able to do this since in South America the summer months constitute the operatic season.

THE UNITED STATES.

ARTISTS. Of all the foreign artists the well-known French composer Cécile Chaminade drew the largest audiences. It must be confessed, however, that popular curiosity rather than unusual artistic merit made her tour so successful. In her concerts, in which she played exclusively her own works, Mme. Chaminade revealed herself as a pianiste of considerable facility of execution, possessing a beautiful singing tone. Emil Sauer was heard again after an absence of nine years, and also as a composer in his E minor concerto. Josef Hofmann also could not resist the temptation of playing one of his own piano concertos, which only disclosed the fact that he lacks creative talent. Vladimir de Pachmann, Josef Lhevinne, Ossip Gabrilowitsch, Harold Bauer, Teresa Carreño, Katherine Goodson were warmly welcomed as established favorites. A new Dutch pianist, Jan Sickses, made a very favorable impression, and pleased by his smooth, velvety tone. Among violinists Mischa Elman, a Russian boy of only nineteen, astonished everyone by his truly marvellous powers. Not only in his flawless technical execution, but especially in the depth and breadth of his conception, he proved himself a mature artist. Fritz Kreisler had already established his repu-

tation as one of the foremost living violinists, but during the past year he showed himself more particularly as a masterly interpreter of the classics. His joint recitals with Josef Hofmann must be reckoned among the musical events of the year. Petschnikoff and Kubelik again fascinated their audiences with their magic power. Among the great vocalists Mmes. Gadski, Nordica, Calvé, Schumann-Heink and Sembrich showed their consummate art in numerous recitals throughout the country. Victor Maurel, after an absence of several years, appeared again in a few recitals, and was greeted with enthusiasm. Nor has David Bispham lost his attraction for his numerous admirers. But all these great artists were overshadowed by that incomparable German lieder singer, Dr. Ludwig Wüllner, whose art is absolutely unique, and whose tour of the country was one uninterrupted succession of triumphs. Among native artists Ernest Schelling, the pianist, attracted special attention. He returned after an absence of three years in Europe, and showed remarkable artistic growth. Mme. Bloomfield-Zeisler, Augusta Cottlow and Richard Buhlig appeared in many concerts. Among the violinists Arthur Hartmann and Albert Spalding scored splendid successes. Karl Klein shared laurels with Calvé on an extended tour.

ORCHESTRAL CONCERTS. The Boston Symphony Orchestra began its new season auspiciously under the conductorship of Max Fiedler of Hamburg, who three years ago was one of the "guest" conductors of the New York Philharmonic Society. Fiedler showed himself a musician of intense feeling, quiet, dignified and sparing of gestures. Besides their regular subscription concerts, the New York Philharmonic Society under Wassily Safonoff gave an extra memorial concert devoted to the works of MacDowell (q. v.).

The New York Symphony Society under Walter Damrosch devoted six of its concerts to the performance of compositions by Beethoven. All the symphonies and many overtures were played. In this cycle a newly discovered Trio of the Bonn master for harpsichord, flute and bassoon received its first performance in America. Tschai-kowski's *Eugen Onégin* was also given in concert form with such success that it had to be repeated at the following concert. Mr. Damrosch offered a unique and extremely interesting entertainment when he engaged the classic dancer Miss Isadora Duncan for pantomimic dances. The orchestra on these occasions rendered Gluck's *Iphigenia in Aulis*, Beethoven's *Seventh Symphony*—styled by Wagner the "Apotheosis of the Dance"—and several Preludes and Mazurkas of Chopin. Sam Franko's Concerts of Old Music were so successful that he enlarged his field of activity by the organization of the Bach Choral Society, which appeared with the orchestra in a Bach program.

The Pittsburg Symphony Orchestra, Emil Paur conductor, secured a new and highly efficient concert-master in the young Dutchman Eduard Tak, who had a rare opportunity of showing his talent when, owing to the illness of Calvé, he was suddenly called upon to take her place as soloist. He made an excellent impression with Beethoven's concerto for violin. The Philadelphia Symphony Orchestra, Carl Pohlig conductor, was increased from sixty to eighty players. The ever increasing demand for high-class orchestral music was attested by the establishment of several new orchestras. Thus, in

Boston, Albert Debuchy appeared at the head of a new orchestra which devotes its energies exclusively to the production of works by French composers. At one of the concerts Berlioz's *Les Troyens à Carthage* was given in concert form. A regular symphony orchestra was organized in Wilmington, Del., by A. H. Rodemann. In Seattle, Wash., the first season of eight concerts of the new Symphony Orchestra under Michael Ke-grize aroused such interest that a fund was started toward the erection of a large concert hall.

CHAMBER MUSIC. To the large number of excellent organizations several new ones were added. The return to America of Alwin Schroeder, formerly the 'cellist of the Kneisel Quartet, led to a reorganization of the Boston Symphony Quartet, which also changed its name to the Hess-Schroeder Quartet. It now consists of Messrs. Hess, Theodorowicz, Ferir and Schroeder. From among the players of the Boston Symphony Orchestra Richard Czerwonky formed the Czerwonky Quartet (Czerwonky, Fielder, Scheurer, Nagel). Their splendid playing won instant favor. The famous Kneisel Quartet (Kneisel, Roentgen, Svecenski, Willeke) played at one of their concerts the two completed movements of a posthumous quartet by Grieg. The Flonzaley Quartet (Betti, Pochon, Ara, d'Archambeau), regarded as one of the finest in all Europe, visited the United States, and fully justified its reputation.

OPERA. At the Metropolitan Opera House in New York 136 performances were given from a repertoire of 33 operas by 16 composers. According to nationality these were divided as follows: Italian, 16 works by 7 composers; German, 14 works by 6 composers (but Mozart's *Don Giovanni* and Flotow's *Marta* in Italian); French, 3 works by 3 composers. Puccini, represented by 5 works, had 29 performances. Next ranks Wagner with 28 performances of 9 works; third Verdi with 27 performances of 4 works. The operas most frequently heard were *Faust* and *Traviata*, each 9 times. Next comes *Madama Butterfly*, 8 times; then *Tristan und Isolde*, 7 times. The works that had only one representation were Mascagni's *Iris*, Donizetti's *L'Elisir d'Amore*, and Wagner's *Holländer*, *Meistersinger*, *Rheingold*, and *Parsifal*. In vain do we look through the records for *Lohengrin*! The year shows the same undue preponderance of Puccini as the preceding; and the cause also was the same. Only two novelties were given. D'Albert's *Tieftand* (Nov. 23), unquestionably this composer's best work so far, was received with approval; while it is difficult to find a reason for the production of Puccini's first operatic attempt, *Le Villi* (Dec. 17).

An event of the first magnitude was the appearance of Gustav Mahler as conductor of German operas. This artist is not only one of the foremost representatives of the modern German school of composition, but also one of the greatest of conductors and authorities on operatic affairs in general. He made his début on New Year's day with *Tristan und Isolde*, and created a profound impression. In one respect he surpasses all conductors ever heard at the Metropolitan, in the subordination of the orchestra to the singers. His dynamics were all pitched in a lower key, so that even in the fortissimo passages the voices could be distinctly heard. He also took some of the tempi faster than we have been accustomed to hear; but in this respect he was less convincing. Beethoven's *Fidelio* re-

DR. LUDWIG WÜLLNER

EDWARD A. MACDOWELL

MISCHKA ELMAN

MME. CÉCILE CHAMINADE

ceived magnificent performances under Mahler, who played it exactly as he had arranged it for Vienna with a new division of the scenes. Likewise Mozart's *Don Giovanni* was given in Mahler's revision. The accompaniments to the recitatives were played by the conductor himself on a piano in the orchestra. The influence of Mahler's artistic moderation showed itself unmistakably in the work of his colleague Mr. Alfred Hertz, who improved the excellent character of his work by toning down the scale of his dynamics. Another début as conductor was that of Arturo Toscanini, one of the foremost Italian conductors and most active apostles of Wagner in Italy. His first appearance, when he led *Aida* on the opening night (Nov. 16), brought him an ovation; but his greatest achievements were the superb performances of *Götterdämmerung*, which equalled the best ever heard. The other Italian conductor Spetrino, was a distinct disappointment. Not only did he not rise above the ordinary routine, but his work was always rough and noisy. Among the sopranos were Mmes. Fremstad, Gadski, Leffler-Burkard, Morena, Sembrich, Destinn, Kaschowska, Gay, Fornia, Alda, Farrar; among the contraltos Mmes. Kirkby-Lunn, Homer, Jacoby. The list of tenors included Caruso, Bonci, Burrian, Burgstaller, Schmedes; the basses Van Rooy, Feinhals, Noté, Goritz, Didur, Scotti, Blass, Hinckley, Witherspoon.

An event of far-reaching significance was the retirement of Director Conried. He was succeeded by Signor Gatti-Casazza and Andreas Dippel as joint directors. But, as happened in the case of the double directorship of the Paris Grand Opera, differences soon arose, which were adjusted by the appointment of Gatti-Casazza as sole director. Among the things promised in the near future is opera in English. In order to stimulate the ambition of the American composer a prize of \$10,000 was offered for the best grand opera by a native American.

At the Manhattan Opera House in New York, 103 performances were given, the repertoire consisting of 26 works by 17 composers. According to nationality these were distributed as follows: Italian, 15 works by 8 composers; French, 8 works by 7 composers; German, 3 works by 2 composers (sung in Italian). Verdi is represented by 6 works in 23 performances. The operas given most frequently were the well-worn *Lucia* and one of the novelties, *Louise*, each presented 11 times. Four novelties were offered: Charpentier's *Louise* (Jan. 3), Giordano's *Siberia* (Feb. 5), Debussy's *Pelléas et Mélisande* (Feb. 19) and Massenet's *Jongleur de Notre-Dame* (Nov. 27). While all were received favorably, Debussy's work attracted the greatest attention and proved to be the event of the season. Some ardent admirers immediately proclaimed Debussy a greater master than Wagner, and attempted to prove that the Frenchman had actually realized the ideal for which the German master had vainly striven. The strangeness, elusiveness, and absolute novelty of the music combined with entrancing stage pictures captivated many, while others were decidedly repelled. But on the whole the admirers were in the majority, so much so that at present New York is the centre of the Debussy cult. Not even in Paris has the French master so many nor such enthusiastic adherents. Massenet's opera suffered considerably from the fact that the composer had rewritten the tenor

part of the juggler as a soprano part to please Miss Garden. A quasi-novelty was Ricci's *Crispino e la Comare*, which had not been heard in New York since 1884. It certainly was not worth the trouble of rescuing from oblivion. Another revival was that of Giordano's *Andrea Chenier*, which had only one hearing in 1906. Verdi's immortal *Otello*, after its unpardonable neglect of several years, was greeted with joy. The splendid performances of Saint-Saëns' *Samson et Delilah* were an act of rather belated justice to this beautiful work. Although it has frequently figured on concert programmes, the critics and public alike declared it a failure as an opera on its only presentation at the Metropolitan in 1895.

While the programme at the Metropolitan was determined chiefly by two tenors, that at the Manhattan was influenced by two sopranos, Tetrizzini and Mary Garden. Especially the former created a furor in the threadbare operas of the old Italian school. From the standpoint of the purely vocal art, however, the reason for such demonstrations can be understood. On the other hand, the causes of Miss Garden's success are not so evident. Undoubtedly the strong Debussy party in New York was one factor. Calvé and Melba appeared in a limited number of performances, the latter in at least one new rôle, that of Desdemona in *Otello*. Among the sopranos were also Mmes. Gerville-Réache, Zeppilli, Bressler-Gianoli, Agostinelli, Jomelli, Russ, Labia, Trentini. The company was weak in contraltos. Among the tenors, four stood out as artists of the first rank: Dalmores, Périer, Zenatello, Constantino; while the chief basses were Renaud, Dufranne, Sammarco, Ancona and Arimondi. Besides the regular performances some operas (*Pagliacci*, *Cavalleria Rusticana*, *Aida*) were given in concert form on Sunday nights. The reason for this is not apparent.

In addition to the regular season of the Metropolitan and Manhattan opera houses, New York had a two months' season of Italian opera in English by the Helen Noldi Opera Company (spring) and two other seasons of Italian opera in Italian by the Ivan Abramson Opera Company (spring and fall). The Aborn Opera Company, which gave grand opera in English in many of the larger cities in the East, was also heard in New York. In fact, New York had grand opera all the year round.

The unusual success of his New York season induced Mr. Hammerstein to erect a magnificent opera house in Philadelphia, which opened its first season on November 17. By the end of the year the artistic and financial success of the undertaking was assured. Boston had a brief operatic season by the Metropolitan forces, and a very successful one of lighter opera by the Castle Square Company. The great enthusiasm aroused the previous year by the San Carlo Company led several public spirited citizens to consider plans for establishing a permanent opera in Boston, with the result that a magnificent house is now in process of construction. The cities on the Pacific Coast enjoyed excellent operatic performances by the Lombardi Opera Company, a South American organization. New Orleans had a brilliant season by the San Carlo Company which included among its artists Nordica, Olitzka, Alice Nielsen, Jane Noria, Maurel and Constantino. Among the light operas Oscar Strauss' *A Waltz Dream* scored a phenomenal success.

FESTIVALS. The eighteenth annual Cincinnati May Festival (May 5-9) under the leadership of

Frank van der Stucken was not only a splendid artistic achievement, but also a financial success. Among the soloists were Gadski, Schumann-Heink, Rider-Kelsey, Janet Spencer, Herbert Witherspoon. Bach's *Passion According to Saint Matthew* was given without cuts. The double choruses were rendered by two complete choruses, and the chorales by a third full chorus. Pierné's *Children's Crusade* was sung by a choir of 700 children recruited from the public schools. In two matinées the Theodore Thomas Orchestra of Chicago, under its conductor Frederick Stock, performed among other numbers Brahms' *Third Symphony* and "The Dance of the Seven Veils" from Strauss' *Salome*.

The fifty-first Annual Music Festival at Worcester opened Sept. 30, with a fine performance of Saint-Saëns' *Samson and Delilah*, in concert form. It was rendered by a chorus of 400 and an orchestra of 60 under the direction of Arthur Mees. Elgar's *Caractacus* had to be repeated by request. Franz Kneisel directed the orchestral concerts, at which two novelties were produced: D'Indy's *Istar* (symphonic poem) and Chadwick's *A Vagrom Ballad*. Augusta Cottlow played MacDowell's *Second Concerto* in D minor.

The Maine Annual Festival took place at Bangor (Oct. 8th, 10th) and Portland (Oct. 12th, 14th) under the leadership of William R. Chapman. The third concert was devoted to excerpts from *Aida*. The programmes were rather too mixed to be called artistic. At the Albany May Festival Berlioz's *Damnation of Faust* and Parker's *Hora Novissima* were performed with the assistance of the Boston Festival Orchestra under Arthur Mees.

NOVELTIES. The most important orchestral novelty heard during the year was Gustav Mahler's *Second Symphony* (C minor). It was produced by the New York Symphony Society under the composer's personal direction (Dec. 8th). The work is one of enormous proportions, and demands an orchestra of 115 players, two solo vocalists, a chorus of 200, organ and a choir of brass instruments in the distance. The performance lasted almost an hour and a half. The composition was received with great enthusiasm, but this was due rather to the inspiring personality and superb conducting of the composer than to the intrinsic merit of the music. Without question, the symphony contains beautiful portions full of truly inspired music, but unfortunately also many commonplaces and too much empty rhetoric.

Carl Pohlig's symphonic poem *Per Aspera ad Astra* was heard by the Philadelphia Symphony Orchestra under the composer's direction. It proved a very melodious work splendidly orchestrated. The Boston Symphony Orchestra brought out under Dr. Muck's direction Bischoff's *Symphony in E*, Rimski-Korsakoff's *Spanish Caprice* and Max Reger's *Variations and Fugue on a Theme by Hiller*, a marvel of contrapuntal skill. The same orchestra under Max Fiedler played MacDowell's *Lamia*, a symphonic poem and one of the composer's earliest works, which did not add to his reputation.

In Chicago the Theodore Thomas Orchestra under Stock played Heinrich Noren's suite *Kaleidoscope*, op. 30, which created a deep impression. In the finale the composer renders homage to R. Strauss by employing two themes from the latter's *Heldenleben*. From the same orchestra was also heard Arne Oldberg's dra-

matic overture *Paolo and Francesca*, a splendid piece of orchestral mood painting.

The Symphony Society under Damrosch introduced also Sir Edward Elgar's *First Symphony*, which had caused such a stir in England. The work proved nothing very remarkable. Like everything of Elgar it showed a serious musician who is a thoroughly accomplished technician. But the musical content is rather insignificant. As a whole the work proved tedious.

The Kneisel Quartet introduced a new string quartet in F minor, op. 12, by Roffredo Caetani. It was splendid music, very passionate and distinctly modern. For operatic novelties see *Opera*.

EUROPEAN COUNTRIES.

GERMANY. ARTISTS. The two great pianists, Godowski and Busoni, created something of a sensation in Berlin, when within the same week they played all twenty-four Preludes of Chopin. The former played them in strict time, the latter rubato; yet both interpretations seemed absolutely convincing. Busoni also played an unpublished *Rhapsodie* of Liszt, the themes of which were later used in more effective form in the *Second*, *Sixth* and *Twelfth Rhapsodies*. At the Elite concerts in Berlin, Emil Sauer played with unparalleled success, evoking applause, such as old concert-goers declared had been witnessed only in Liszt's concerts. After an absence of several years Adele aus der Ohe appeared again in Berlin, and surprised her audience in the new rôle of composer. Her principal number was a well-written suite for piano in six movements. Carreño, as usual, electrified her audiences. Alexander Siloti was warmly welcomed after an absence of fifteen years. The French pianist Edouard Risler and the Russian Waldemar Lüttschg were as warmly received. Neither was able to fascinate his audiences, yet both won the admiration of musicians through their wonderful technic and unusual intellectual grasp of the works rendered. Of special interest was the appearance of Josef Wieniawski, a brother of the famous violinist, in a concert of his own works. While not remarkable as a composer he interested his audience by a performance of his piano concerto, which was a feat for a man of seventy-one. He showed himself in all respects a worthy representative of an older school. Among the violinists Achille Rivarde aroused unusual interest in Berlin, for that great artist had never been heard there. He resembles the great Sarasate (q. v.) in the elegant and finished style of his playing, and his success was phenomenal. To say that Ysaye everywhere evoked scenes of wildest enthusiasm is a matter of course. The same may be said of the performances of Kreisler, Petschnikoff and Marteau. The last named artist was signally honored when he was appointed Joachim's successor as head of the violin department at the *Königliche Hochschule für Musik*.

Willy Hess, the concert-master of the Boston Symphony Orchestra, was heard again after fifteen years with the Berlin Philharmonic Orchestra and warmly received. Bronislaw Huberman aroused great interest and enthusiasm by his novel idea of giving three concerts of violin concertos arranged according to schools: 1. German (Beethoven, Mendelssohn, Spohr). 2. French (Saint-Saëns, Lalo, Vieuxtemps). 3. Slavic (Tschaikowski, Dvofák, Wieniawski). Alessandro Certani gave a concert at which he played only unpublished compositions for violin

and piano by the old Italian sonatists Veracini, Vivaldi, Tartini, Martini, Alberti, Porpora. César Thomson's reception was of the most enthusiastic character and his playing absolutely disproved the rumors that had been circulated regarding his general decline. Scarcely had the Germans recovered from their surprise at the marvelous art of Mischa Elman, when another prodigy, fifteen-year-old Sascha Colbertson, proved his claim to mastery in Berlin and Leipzig. In conception and execution he was ranked among the greatest violinists, while his physical power of endurance seemed sheer inexhaustible. Among the 'cellists Jean Gérardy delighted vast audiences with his art. He confined himself to the established well known compositions for his instrument. On the other hand Anton Hekking, Jacques van Lier, Pablo Casals and his wife (formerly Senhora Suggia) did pioneer work for new compositions—a rather thankless task in this case.

Lilli Lehmann showed that at the age of sixty-two she is still one of the greatest of lieder singers. The recitals of Schumann-Heink, now an American citizen, were an uninterrupted succession of triumphs. Other great vocalists who charmed large audiences were Dr. Ludwig Wüllner, Carl Heinemann, Anton Sistermanns, Julie Culp, Tilly Koenen.

ORCHESTRAL CONCERTS. Besides the regular subscription concerts of the numerous orchestral organizations throughout the Empire an unusual number of special and private concerts were given. The sum total of the various programmes shows a splendid artistic balance, bearing testimony to the universality of taste on the part of concert-goers. The older masters were reverently cultivated, and every living master, of whatever nationality, was well represented. The only school distinctly discriminated against was the modern French. Little was heard of Debussy, D'Indy, Dukas, Charpentier. That this is not due to national prejudice is sufficiently proved by the frequent performances of works of older French masters like Berlioz, Gounod, Bizet, Saint-Saëns, Massenet. Russian composers found great favor in Germany. The interest in the "guest conductor" continued unabated, as is shown by the fact that famous conductors often gave concerts without the assistance of soloists.

The twenty-fifth anniversary of the death of Wagner was fittingly and universally observed. In his series of Gürzenich concerts at Cologne, Fritz Steinbach included three concerts, each devoted exclusively to the works of Beethoven, Brahms and Bruch. Léon Rinskopf, with his Ostend Symphony Orchestra, gave a concert in Berlin at which he performed only works by Belgian composers, Blockx, Gilson, Théophile Ysaye, Tinel. Dimitri Aichscharumoff and Michael Serbuloff conducted in Berlin concerts of Russian music, including several novelties. The Russian Balalaika Orchestra, consisting only of old Russian instruments (balalaika, domra, gussli), under its leader W. Andreeff, made a most successful tour. When Weingartner entered upon his duties as director of the Vienna Opera he broke his contract with the Berlin Royal Orchestra, whose remaining concerts were led by various conductors. In the fall Richard Strauss was appointed Weingartner's successor. The famous Kaim Orchestra of Munich was disbanded, but the players organized themselves as *Der Münchener Konzertverein* under the conductorship of Ferdinand Loewe.

At the head of the Berlin Philharmonic Orchestra R. Strauss made a five weeks' tour of France and Spain, which proved a tour of triumphs.

CHAMBER MUSIC. The Halir Quartet gave a series of concerts in which it played all of Beethoven's string quartets. The Flonzaley Quartet visited Berlin for the first time and made a profound impression, in spite of the complaint of Berlin critics that they were surfeited with string quartet organizations. Marteau and Dohnanyi made a tour of the principal cities, playing all of Beethoven's sonatas for piano and violin. Marteau also organized a new quartet which was criticised for lack of balance, as Marteau and Becker ('cello) stand far above the two other players. In spite, or perhaps because, of the general apathy to works of the modern French school, Carl Flesch undertook to make propaganda, and in a series of six concerts presented works by Fauré, Franck, Chausson, Pierné, Le Borne, Widor, Debussy, Ropaertz. Sergei Taneieff assisted the Bohemian String Quartet in a concert devoted to his works. His new string quartet in B flat made a deep impression, and was pronounced by critics the greatest work of its kind since Brahms.

OPERA. Among the most important events of the operatic world was the much-regretted resignation of Gustav Mahler from the directorship of the Vienna Opera. His successor, Felix Weingartner, began his career by practically undoing everything Mahler had accomplished. The number of performances of Wagner's works was greatly reduced, and not a single cycle of the Ring dramas was given. But he revived older works of a lighter character like Auber's *Fra Diavolo*, Lortzing's *Wildschütz*, Götz's *Taming of the Shrew*, Brüll's *Das goldene Kreuz*. While Mahler had always been averse to the ballet, Weingartner encourages it.

The St. Petersburg Opera gave a series of twenty performances of Russian operas at Kroll's Theater in Berlin. On this occasion Napravnik's *Dubrowsky* and Dargomyschky's *Russalka* were heard for the first time in Germany. The undertaking was not successful, either artistically or financially. Of the singers only Mmes. Kousnetzowa (soprano), and Sbrueva (contralto) and the tenor Bonatschisch were really great artists.

In Leipzig Verdi's *Otello*, which had not been heard there since 1892, was revived with great success. Düsseldorf heard Verdi's *Falstaff* for the first time and received it with wild enthusiasm. Strauss' *Salome* continued its triumphal tour and was given in fifty cities. At the Royal Opera in Berlin, Caruso and Schumann-Heink received ovations as had not been tendered to any singer since the days of Pauline Lucca (q. v.) At its Berlin première Puccini's *Bohème* met only with moderate success, while the same composer's *Manon Lescaut* was received with indifference. In spite of a splendid representation the Berlin première of Debussy's *Pelléas et Mélisande* failed to arouse interest. Subsequent performances proved flat failures. Yet, according to all reports, the scenic effects were wonderful. No curtain was used. The change of scene was effected while the stage was completely darkened. Thus every picture rose out of the darkness as if by magic. Another belated Berlin première was Leoncavallo's *Zaza*, which proved successful. At its première in Dresden Tchaikowski's *Engen Onégin* aroused a storm of enthusiasm. Leo Blech's *Versiegelt* met with great success in

Hamburg and Berlin. In Dresden Juan Manén's *Acté* made a deep impression.

NOVELTIES. Among the vast number of novelties preformed there is an unusual number of new works for 'cello, but nothing of permanent value. Among the concertos for piano, Xaver Scharwenka's *Fourth*, in F minor, scored an emphatic success. It is spontaneous, beautiful music. Max Reger's *Concerto for Violin*, op. 101, was played by Marteau at one of the Gewandhaus concerts in Leipzig. Both the public and musicians were completely bewildered by this ultra-modern work bristling with difficulties, whose performance required more than an hour. Of new symphonies Gustav Mahler's *Seventh* was well received, but, like most of his works, divided critical opinions. Kalinnikoff's *Symphony* in E minor and Buttykay's in C sharp minor attracted favorable notice for real musical content, classic form and masterly orchestration. A new *Trio*, op. 102, by the prolific Reger proved to be a really great work, especially in the Adagio.

ENGLAND. ARTISTS. Among the pianists heard were Godowsky, Dohnanyi, Mark Hambourg, Gabrilowitsch, Burmeister, Carrefio, Samaroff, Menter; among the violinists Ysaye, Sauret, Mischa Elman, Zimbalist, Hubay, Spalding. Adelina Patti drew a large audience at a charity concert, and showed that she still can sing if she chooses, as she did, only such works as are still within her range. Theodore Byard gave recitals, which included several songs by Franz, who is still, and very unjustly, neglected in England. In seven historical recitals Ernest Sharpe gave a splendid selection of songs from the sixteenth century to the present day. The last recital was devoted to works by American composers. Dr. Ludwig Wüllner's rare art aroused wild enthusiasm.

OPERA. The year opened with a two weeks' season of grand opera in English. A complete cycle of Wagner's Ring dramas, without cuts, was given under the direction of Hans Richter. Almost all the singers were natives of England. The success of the short season was most emphatic. The regular opera season began April 30th and lasted thirteen weeks. Among the artists were Tetrizzini, Melba, Destinn, Gulbranson, Maria Gay, Kirkby-Lunn, Bonci, Zenatello, Knoté, Cornelius, Scotti, Sammarco, Van Rooy. The conductors were Richter, Campanini and Panizza. German and Italian operas were given on alternate nights. The Moody-Manners Opera Company added Halévy's *Jewess* in English to their repertoire.

ORCHESTRAL CONCERTS. The concert season was a very busy one. Debussy conducted a concert of his own works with the Queen's Hall Orchestra, but made little impression. The great contra-bass virtuoso, Kussewitzky, appeared also as conductor and made an excellent impression as a Beethoven interpreter. Señor Arbos continued his propaganda for Spanish music; two of his concerts were devoted to works by Bretón. The Worshipful Company of Musicians performed works of English and French composers of the sixteenth, seventeenth and eighteenth centuries on old instruments. Under Nikisch the London Symphony Orchestra scored a succession of triumphs on a tour of the provinces. At the popular Promenade Concerts all of Beethoven's symphonies were heard in chronological order under the direction of Henry Wood. The famous Société des Concerts d'instruments Anciens appeared for the first time in England and met

with decided success. Many novelties by English composers were heard, but few made any impression. The performance of Elgar's *Faust Symphony* by Hans Richter in Manchester was regarded as a great event. The work had a most enthusiastic reception. Many critics hailed it as the dawn of a new era in English music.

FRANCE. OPERA. The new régime at the Grand Opéra under the double directorship of Messrs. Broussan and Messager did not fulfill the high expectations that had been entertained. Misunderstandings soon arose which ended in M. Messager's handing in his resignation. This, however, was not accepted. But it is feared that the difficulties have been arranged only temporarily. Wagner's *Götterdämmerung* had its first performance at the Grand Opéra on Oct. 16th. It was given without cuts under the direction of André Messager, and was an overwhelming success. Special significance was attached to the première of Mussorgsky's *Boris Godunoff* from the fact that it was the first work by a Russian composer given at the Opéra. Rameau's *Hypolyte et Aricie* was revived, but in spite of a superb representation it failed to draw. Caruso made his début in Paris in *Rigoletto*, and roused the audiences to frantic demonstrations. At the Opéra Comique several novelties were given of which only Rimsky-Korsakoff's *Snegourotschka* proved a great success. Marie Delna after a retirement of several years returned again to the scene of her former triumphs. She was welcomed as only Parisians can welcome old favorites. At the Théâtre Gaité Leoncavallo's *La Vie de Bohème* scored a success.

ORCHESTRAL CONCERTS. The Colonne Orchestra invited Richard Strauss to conduct a concert of his own works. The German master was greeted with the wildest enthusiasm. When he appeared a little later with the Berlin Philharmonic Orchestra the excitement ran so high that hundreds had to be turned away. Felix Mottl conducted a Wagner-Berlioz festival with the Lamoureux Orchestra. With the same orchestra André Messager made his début as a concert conductor, and was no less successful than at the opera. His success was so pronounced that after the death of Georges Marty (q. v.) he was elected conductor of the famous Conservatory Concerts. At the Théâtre Châtelet Colonne performed all of Beethoven's symphonies in chronological order. At the Salle Gaveau the violinist Sechiari appeared as conductor. He had an excellent orchestra and devoted his concerts chiefly to the production of novelties.

MYTHOLOGY, INDIAN. See ANTHROPOLOGY.

NATAL. A British colony in South Africa. Area 35,371 square miles. Population on Dec. 31st, 1907 (exclusive of military), 1,164,285, of whom 949,099 were natives, 115,807 Asiatics, 6,894 mixed, and 92,485 whites. Pietermaritzburg, the capital, had 31,199 inhabitants in 1904; Durban, the only port, 68,359 (29,802 Europeans, 19,183 natives, 17,256 Asiatics, 2,088 mixed) in 1907. There are primary schools for Europeans, natives and Asiatics, and two government high schools.

PRODUCTION. A Norwegian company, recently formed for exploiting the whaling grounds adjacent to the South African coast, particularly that of Natal, has established fishing stations at Durban and Port Shepstone. Whales were landed at Durban in July and August, 1908. The production of coal in 1907 was 1,530,043 tons,

valued at £690,391. The number of coal miners in 1907 was 7,699 (440 white, 4,095 natives, 3,164 East Indians). The number killed in the mines was 21, and injured 94, against 39 and 70, respectively, in 1906. The greater part of the coal is exported or sold to steamers. The gold production in 1907 was 878 ounces, valued at £3,730. The production of copper ore was 41 tons. Immense deposits of kaolin clay, estimated to contain millions of tons, have been found at Padley's Station. On the surface the deposit is more or less impregnated with iron, but lower down it is almost pure, and compares favorably with the French clays. Their exploitation has already begun. In August, 1908, it was decided to appoint a commission to inquire into ways and means for developing the mining industry, particularly as regards gold and other metals, and to prepare a revision of the mining laws so as to bring them into conformity with those of other South African colonies. The maize crop of 1908 was estimated at 186,000,000 pounds, or 6,000,000 less than in 1907. The production of sugar was 33,000 tons in 1906-07; 40,000 tons in 1907-08; and 45,000 tons in 1908-09. Of the 24,761 indentured East Indians in Natal, 7,131 were employed on sugar estates. A modern refinery has been established at South Coast Junction by a company recently organized. The area under tea was estimated in 1908 as 5,850 acres, and the output at 2,200,000 pounds. The production of cotton in 1907 was 19,186 pounds. The export of wattle bark, for tanning, is rapidly increasing; in 1907 it was 23,839 tons, valued at £136,873, against 14,756 tons, valued at £89,856, in 1906. According to the latest returns there were in the colony 524,712 woolled sheep owned by Europeans, besides 16,900 Persian sheep, and 37,000 other sheep. Of native sheep there were 200,000 owned by natives and 50,000 by Europeans. The export of wool through Durban in 1907 was 20,264,000 pounds, against 17,870,000 in 1906. The increase is due chiefly to the natural increase of the flocks, but partly also to the extension of railways in the Orange River Colony. The quantity of mohair exported through Durban in 1907 was 1,126,000 pounds, against 1,075,000 pounds in 1906. Recently established industries include a starch factory, a bacon factory, a woolen mill, and several new sugar mills.

COMMERCE AND COMMUNICATIONS. The imports in 1907 were valued at £8,704,222 (£3,709,670 from Great Britain), and the exports at £10,057,339 (£1,779,089 to Great Britain). Natal forms a part of the South African Customs Union. (See *BRITISH SOUTH AFRICA*.) At the end of 1906 there were 935 miles of railway, all owned by the government with the exception of 50 miles, constructed by a company but worked by the government. The cost of railway construction up to the end of 1906 was £13,892,969. In 1907 the gross revenue from railways was £1,843,000; and the working expenditure, £1,236,000. The length of telegraph line in 1906 was 1,944 miles.

GOVERNMENT, FINANCE, ETC. Natal has representative institutions and responsible government. The franchise is based on a property qualification. In 1908 the Governor was Sir Matthew Nathan; the Prime Minister, F. R. Moor. The revenue in 1906-07 was £3,471,932; the expenditure, £3,681,914; and the public debt on June 30, 1907, £20,760,992. At the end of 1907 the military force consisted of 1,006 mounted police, exclusive of native and Indian

constables; 2,739 militia, of whom 1,487 were mounted and 419 were in the artillery; 129 rifle associations with 6,567 members; 344 senior cadets, and 3,143 school cadets.

HISTORY. At the beginning of December, 1907, after many murders and outrages by the natives of Zululand, martial law was proclaimed and the colonial troops were mobilized. On the arrival of the troops at Nongoma the chief, Dinuzulu, was called upon to surrender (Dec. 6th) and he did so unconditionally on Dec. 10th. Contrary to the Governor's advice, martial law was maintained for some time after the troops were demobilized early in the year. The Governor made a tour of the country and announced the pardon of the rank and file of the rebels of 1906. Dinuzulu was taken to Durban for trial under the ordinary civil law. His counsel alleging improper action on the part of the Natal authorities appealed to the imperial government for the removal of Dinuzulu to England for trial. This and other requests were denied and he subsequently threw up his brief. There was some friction between the colonial and home authorities. The latter, after the Natal government had suspended Dinuzulu's salary, decided to pay it out of imperial funds in spite of the protests of the Natal ministers. Dinuzulu's trial was finally begun at Greytown in the latter part of October before three British commissioners. The increased participation of the natives in the government was the subject of much discussion. Among the changes proposed were the representation of natives in the Legislative Council, the formation of a Council of Native Affairs, the periodical assembling of natives to discuss their own affairs, the establishment of native settlements, and the granting to natives of an inalienable individual title to their allotments. The deficit of the previous year having brought the total net deficit to £519,000, a graduated income tax bill was adopted in September. It imposed a maximum rate of 5 per cent. on incomes over £1,000. For Natal's share in the movement for a United South Africa see *BRITISH SOUTH AFRICA*.

NATIONAL ACADEMY OF DESIGN. A society of artists which originated as the New York Drawing Association in 1825, and in the following year was reorganized under its present name. The object of the academy to further the arts of design is accomplished by the maintenance of schools. The schools are free to accepted students, the only limitation being that none but those intending to follow art as a profession are eligible. Annual prizes are offered for excellence in various lines of work in the schools. There are various prizes and medals awarded at the Annual and Winter Exhibitions of the Academy of Oils, Pastels and Sculpture. The National Academy of Design had a membership of 253 in 1908, made up of 137 academicians and 116 associates. President, Frederick Diehlmann; secretary, H. W. Watrous.

NATIONAL BANKS. CONDITION. The number of national banks on Sept. 23d, 1908, was 6,853, as against 6,625 in December, 1907, and 3,942 in December, 1900. The aggregate resources were \$9,027,260,000 in September, 1908, compared with \$8,407,988,000 in December, 1907. The principal items of resources in September, 1908, were: Loans and discounts, \$4,750,612,000; United States bonds to secure circulation, \$628,073,000; bonds and securities, \$799,884,000; due from

other banks \$491,395,000; due from approved reserve agents, \$711,948,000; cash on hand, \$889,213,000. The principal items of liabilities were: Capital stock, \$921,463,000; surplus and undivided profits, \$767,665,000; outstanding circulation, \$613,726,000 (does not include \$48,639,000 circulation secured by lawful money); due to other banks, \$1,903,989,000; individual deposits, \$4,548,135,000; United States deposits, \$114,378,000. Loans increased continuously during the year, after passing the year's minimum amount in February. The loans of September exceeded the maximum of 1907 by \$82,000,000. An analysis of the loans showed that 33.3 per cent. were time loans based on two-name commercial paper, 21.1 per cent. time loans based on stocks and bonds, 17.9 per cent. time loans based on single-name paper, 19.4 per cent. demand loans based on stocks and bonds, and 8.3 per cent. demand loans based on one- or two-name paper. Banks in New York loaned 19.06 per cent. of the total; banks in all three central reserve cities, 26.16 per cent.; banks in other reserve cities 25.93 per cent., and country banks 47.91 per cent. More than 41 per cent. of the New York City loans were demand loans secured by stocks and bonds. Of the bonds and securities held by national banks, two-thirds were railroad and other corporation bonds, 14 per cent. were State and municipal bonds, and 18 per cent. were judgments and claims. The total amount of these securities of the savings bank class was sufficient to make possible the issue of the entire amount of \$500,000,000 additional circulation authorized by the Act of May 30th, 1908. See CURRENCY.

The capital stock increased \$21,090,500 in the year ending in September, 1908. There were at that time 1,826 banks having \$25,000 capital, this being one-fourth the total number of national banks, but they had only 4.9 per cent. of the total capital. There were 2,116 banks, or 30.8 per cent. of all, with capital above \$25,000 but not above \$50,000, and they had 10.8 per cent. of the aggregate capital. Banks of the next class, those with capital not exceeding \$100,000, numbered 1,623, or 23.6 per cent. of all, and they had 16.3 per cent. of the total capital. Of banks with more than \$100,000 capital but not more than \$250,000 there were 757, or 11 per cent., having 15 per cent. of the capital. Banks of the class over \$250,000 to \$1,000,000 inclusive, numbered 476, or 6.9 per cent. of all, but they had 26.8 per cent. of all capital. There were 69 banks with capital between one and five millions and 6 with capital above five millions, these two classes having together 26 per cent. of the total.

The national bank note circulation was unusually large. The maximum attained on Dec. 1st, 1907, was exceeded every month during the year 1908. The amount outstanding on June 1 was \$698,449,517, the year's maximum, and an amount never before reached. The minimum for the year was \$665,844,900 on Nov. 1st. These items include not only circulation secured by United States bonds, but also that secured by lawful money, which on June 1 amounted to \$73,735,370. One effect of this large circulation was to flood the redemption office at Washington with notes. The issues during the year amounted to \$367,017,000, and the amount redeemed and destroyed \$310,398,000. The cost of redemption was 90 cents per \$1,000. Almost 60 per cent. of the redeemed notes came from New York City banks. Of the \$613,700,000 bond-secured circulation outstanding Sept. 23d, 64 per cent. was

issued by the country banks, 34 per cent. by all reserve city banks, 13.5 per cent. by the banks of the three central reserve cities, and 9 per cent. by New York banks. More than 42 per cent. of the circulation was in ten-dollar notes, 29 per cent. in twenties, 20 per cent. in fives, 2.6 per cent. in fifties, and 6 per cent. in one hundreds.

The amount of United States funds on deposit with national banks fell steadily from \$221,437,000 in February to \$111,802,000 in November.

The net earnings of national banks in the year ending June 30, 1908, were \$131,335,000. The dividends paid amounted to \$97,336,000, or 10.9 per cent. on the paid in capital, or 6.75 per cent. on the aggregate of capital and surplus. The amount of United States deposits in national banks dropped steadily from \$223,117,000 Dec. 3d, 1907, to \$170,700,000 in May, to \$118,576,000 in July, and to \$114,378,000 in September. The new currency law imposed 1 per cent. interest on the average monthly deposits of public money, but stipulated that no reserve need be kept against such deposits.

The number of national bank failures in 1908 was unusually large. (See FINANCIAL REVIEW, *Failures*.) Since the beginning of the national banking system 499 banks have been placed in the hands of receivers; there were 77 receiverships not yet ended in 1908. In this entire period the average loss to creditors in receiverships fully settled was 17.78 per cent. of the total liabilities, a loss of \$42,472,910, or .06 per cent. on average deposits in active national banks.

LEGISLATION. The act of May 30th, 1908, known as the Aldrich-Vreeland bill, provided a legal means of quickly expanding national bank circulation in times of money stringency. The provisions of that law are given in full under CURRENCY. The National Monetary Commission provided for by that act has under consideration several changes in national banking laws, some of which have been recommended by recent controllers of the currency. One of these is a change in the methods of appointing national bank examiners with a view to increasing their efficiency. Another is a change in the method of paying examiners by substituting salaries for the present fees. Other questions are the limitation of the amounts officers and directors of a bank may borrow from it; the advisability of allowing a bank to hold stock in other corporations, notably trust companies; and an increase in the powers of the Comptroller of the Currency. A change introduced by the Comptroller late in the year was the division of the country into "examiners' districts," and the provision for periodic meetings of the examiners of each district. See BANKS AND BANKING and FINANCIAL REVIEW.

NATIONAL CIVIC FEDERATION. An organization founded in 1900 in Chicago "to organize the best brains of the nation in an educational movement toward the solution of some of the great problems relating to social and industrial progress; to provide for study and discussion of questions of national import; to do this under the crystallization of the most enlightened public opinion; and when desirable, form legislation in accordance therewith." In the accomplishment of this purpose the Federation has been successful in uniting in the activities not only the leaders of thought, but leaders of action as well. Men prominent in the commercial and manufacturing life have worked in harmony with the leaders of labor organizations and out of this affiliation much good has come. The Federation

has done great service since its organization in the discussion of questions within its scope and in the arbitration of difficulties between capital and labor. Largely as the result of its immigration department, Congress was induced to provide an Immigration Commission, composed of six of its own members and three other persons, which has undertaken a large part of the work that had been planned by this Department of the Federation. The conciliation department of the Federation has for its chief purpose the prevention of strikes and labor difficulties by acting as a friendly counselor when called upon by the parties at issue. During 1908 a series of conferences was held on the invitation of one side or the other and disturbances which menaced industrial peace were averted. Allied with this movement was the impetus given to the trade agreement idea by the better and more permanent organization of this department. Trade agreement in its best form provides its own machinery for the adjustment of difficulties as they arise, and thus renders outside agencies in large measure unnecessary. Mr. John Mitchell is at the head of this department of the Federation.

Among the most important work undertaken by the Federation is included in its Welfare Department, the function of which is to promote welfare work among the employees of private enterprises and among those engaged in government service. Many large corporations and companies have shown much interest in this work. Out of this grew an interest in the government servant, which, based upon the maxim that the "government should be a model employer" led to the formation of a special committee to look after the interests of the public servant, whether employed by nation, State or city. Investigations along these lines were made during the year into conditions among the employees in the Panama Canal Zone, in the New York Post Office and in hospitals, asylums, etc., of both city and State, and the results show that these efforts will be amply repaid. During 1908 this work received fresh impetus by the formation of a Woman's Department, the underlying idea of which is, first, that as owners of industrial stocks, and through their husbands and relatives, women have an excellent opportunity to work for social betterment; and, second, that as concerns the labor of women and children, women naturally have a better understanding of needs of measures to relieve them than can be expected of men.

Out of the Conference on Trusts and Combinations held in the fall of 1907 grew a significant effort on the part of the Civic Federation to secure an amendment to the Sherman Anti-Trust law. After repeated conferences a bill was drawn up and later introduced in Congress, which was the subject of long and careful consideration before committees of the Senate and House of Representatives in March and April, 1908. While the bill got no further than the committees it served a useful purpose as means of presenting to Congress a consideration of the legal and economic questions involved in trusts and their regulation. See TRUSTS.

Under the auspices of the Industrial Economics Department, the Federation organized in 1908-09 a visit of American teachers to the schools of Europe, and especially of the United Kingdom. At the request of the organization, school boards throughout the country very generally granted leave of absence to teachers who desire to avail themselves of the opportunity.

The ninth annual meeting of the Federation was held in New York City, Dec. 14th and 15th. Among the questions discussed were: Industrial Insurance Here and Abroad, by Lee K. Frankel; Massachusetts Savings Bank Plan for Annuities, by Louis D. Brandeis, of Boston; Postal Savings Banks, by Marcus M. Marks, of New York; Insurance Fund of the Machinists' Union, by James O'Connell, of Washington, D. C.; Industrial Insurance by Private Companies, by Haley Fiske, of New York; Employees' Mutual Benefit Association of the Krupp Company, by Major A. E. Piorkowski, of Essen, Germany; Pension Funds of Individual Employers, by A. P. Loring, of Boston; The Burden of Compensation, by Hon. J. D. Beck, of Wisconsin; Shall Industry Bear the Cost of Industrial Accidents, by John Mitchell, of New York; The Labor Laws of Canada, by Hon. F. A. Acland, of Canada; Salary Loan Evils, by Frank H. Tucker; Employees' Association Lending Plan, by B. J. Greenhut, of New York; Employees' Savings and Loan Fund, by H. S. Dennison, of Boston.

At the dinner on Dec. 15th, those who spoke were Hon. W. H. Taft, Hon. Seth Low, Andrew Carnegie, August Belmont, M. E. Ingalls, A. B. Garretson, Samuel Gompers and John Mitchell. The officers of the Federation for 1909 are: President, Seth Low; Vice-Presidents, Samuel Gompers, Nahum J. Bachelder, Ellison A. Smyth, Benjamin I. Wheeler; Treasurer, Isaac N. Seligman; Chairman Executive Council, R. M. Easley; Secretary, D. L. Cease.

NATIONAL CONSERVATION COMMISSION. See FORESTRY.

NATIONAL MUSEUM, UNITED STATES. The National Museum was originated in the act of Congress of 1846 founding the Smithsonian Institution, and is the official custodian of the national collections. Its expenses are annually provided for through appropriations made by Congress. The Museum is especially rich in collections illustrating the natural history, geology, paleontology, archaeology and ethnology of America.

The collections of the National Gallery of Art were increased in 1908 through further accessions from Mr. William T. Evans, while other gifts of paintings were received from Mrs. James Lowndes and the friends of Max Weyl. A fine series of marine historical paintings by Edward Moran was received on deposit. A large number of various kinds of laces, embroideries, etc., have been sent to the Museum through the efforts of a committee of ladies.

Nearly 220,000 specimens were added to the Museum collections during the year. In ethnology the most important accessions consisted of a valuable assortment of objects collected from the natives of West Borneo by Dr. William L. Abbott, and of some very interesting material from the Philippine Islands, Guam and other islands of the South Pacific. Notable accessions in prehistoric archaeology were received from Mexico, Bolivia, Egypt and India, as well as from various parts of the United States. The flag made famous through the verses of Francis Scott Key as the "Star Spangled Banner," was lent by Mr. Eben Appleton, of New York City. Many interesting objects were added to the collections of the Colonial Dames of America and of the Daughters of the American Revolution.

Valuable accessions to the collections of birds and mammals were received from Sumatra and

Borneo through Dr. William L. Abbott, and from the Philippine Islands through Dr. Edgar A. Mearns, United States Army. The collection of insects was increased by about 53,000 specimens, including several contributions from European countries. Large collections of fishes from the Pacific Ocean and of mollusks from the Philippine Islands were obtained. The National Herbarium was enriched by about 25,000 specimens of plants, chiefly from North and Central America, and Mexico. To the paleontological collections were added several notable accessions, such as the celebrated Gustav Hambach collection, the Gilbert collection of Niagaran fossils, and a very large series of Cambrian fossils obtained in British Columbia and Idaho by the Secretary of the Smithsonian Institution, Charles D. Walcott. Many rare fossil reptiles and mammals were obtained from various horizons in the United States and South America.

NATIONAL RESOURCES, CONSERVATION OF. See AGRICULTURE; UNITED STATES; FORESTRY.

NATURAL GAS. The value of natural gas as reported by the U. S. Geological Survey was \$52,866,835 in 1907, as compared with \$46,873,932 in 1906. In 1908 reports from most of the gas producing fields indicated little change in conditions. In Kansas, where the consumption of natural gas is very large, during 1908 there was not only much new drilling, but also a considerable extension of the pipe line service through the State, and especially in Kansas City, so that by the end of the summer practically all of the city and suburbs was supplied with natural gas, which is used both for domestic purposes and for small factories, and even by some of the larger factories in summer. Gas is piped to all of the large cities of the State, as well as to many smaller towns, and during the year the supply pipes were extended to the Joplin zinc mining district. The Kansas Natural Gas Company was the largest consumer of gas, and according to official statements, its income in 1907 from the sale of natural gas slightly exceeded \$3,000,000, while in 1908 it was estimated to be about \$4,000,000. During the year large pumping plants were installed to insure an adequate supply of gas. There are other consumers, one of which the Wichita Gas Company supplies a number of salt, zinc and cement plants with fuel in addition to glass plants, brick plants, and other factories in addition to domestic and business consumption. In Oklahoma State laws and a decision of the Secretary of the Interior as regards leased Indian land prohibit the piping of gas out of the State, and as a result there have been developed no strong distributing companies, and it was the usual practice for each town to have its own pipe line. While there was little new development in the way of new gas fields, yet some drilling was done, and at the end of the year there was every indication that a much larger yield could be obtained from the State. In Texas gas wells of great volume were located in Clay County, and were being used to supply nearby cities, with probability of pipe lines being constructed to Dallas and Fort Worth.

NATURAL HISTORY. AMERICAN MUSEUM OF. An institution established in New York city in 1869 for maintaining a museum and library of natural history and advancing knowledge of kindred subjects. In 1907 "pay

days" were abolished and the Museum is now absolutely free daily. The year 1908 was the most notable in the history of the institution. The receipts were \$275,419, \$25,000 more than in 1907. This was largely the result of the bequest by Morris K. Jesup. The endowment fund, including the bequest of the late President Jesup, is \$2,048,156. Explorations are carried on in North America, in the United States, Canada, Alaska, Central America, West Indies, Asia, and in the Islands of the Pacific. The gross attendance at the Museum in 1908 was 1,043,582. This was in large part due to the exceptional interest in the Tuberculosis Exhibition (see TUBERCULOSIS). The attendance on public afternoon and evening lectures reached a total of 82,718. During the year 1909 the principal exhibitions which will be developed are the Children's Museum, the Museum for the Blind, the Philippine Exhibition, and the Congo Exhibition presented by King Leopold of Belgium. In 1908 the scientific staff of the Museum was strengthened by the addition of Professor Bashford Dean, a traveller and ichthyologist of international reputation. Professor Henry E. Crampton of Columbia University has been appointed Head Curator of the Department of invertebrate Zoology to succeed Professor W. Morton Wneeler, who resigned to accept a professorship in Harvard University. During the year valuable gifts were received from Mrs. Morris K. Jesup, Mrs. Armar D. Saunderson, Mr. George S. Bowdoin, Mr. Archer M. Huntington, Mr. Henry Booth, Dr. William Morton Wheeler, and others.

NAVAL PROGRESS. The accompanying table shows the comparative naval strength of the great powers of the world as reported on Nov. 1st, 1908, in an official document of the United States Senate. It indicates clearly the strength and condition of the navies of the various powers, and may be supplemented by a brief description of the advances made in the naval service generally during the year. These, in the main, have been closely connected with political questions in the various countries and the development of the navies has depended more on appropriations and budgets than on technical progress. The designs of battleships (q. v.) has been the most important subject of general discussion and the increase of navies by the largest war vessels ever constructed seems to be desirable in the opinion of most naval experts. Submarine boats and destroyers continued to be constructed and tested, especially in Europe, while guns of increased power were being provided for all navies, especially in the secondary batteries to repel torpedo attacks, as the range of these weapons had been increased materially during the previous few years. Typical of the naval progress of most of the leading powers was that of the United States, which may be summarized below. Under the heading *Navy* in the articles on the various countries will be found a discussion of the strength and development of their navies, together with an account of the more important events of the year.

In 1908 an appropriation was made by Congress for the establishment of a stronger naval base at Pearl Harbor, Hawaii, with coal sheds, and one graving dry dock to take the largest ships. This was to form an important naval base for the United States in the Pacific. The naval station at Olongapo was improved and developed, that at the Island of Guam dredged and

NUMBER AND DISPLACEMENT OF WAR SHIPS, BUILT AND BUILDING, OF 1,000 OR MORE TONS, AND OF TORPEDO CRAFT OF MORE THAN 50 TONS.

(Document No. 570, U. S. Senate, 1908. Comparative strength of the Great Powers, November 1st, 1908.)

[The following vessels are not included in the tables: Those over 20 years old, unless they have been reconstructed and rearmed since 1900; those not actually begun, though authorized; transports, colliers, repair ships, torpedo depot ships, converted merchant vessels or yachts; vessels of less than 1,000 tons, except torpedo craft; torpedo craft of less than 50 tons.]

improved, while those at Cavite and Culebra were being improved. The training station on the Great Lakes also was being developed. Improvements were made in the fire control and a new system of instruments was fitted to eighteen battleships, including the Atlantic fleet and several cruisers. Improvements in fire control were also taking place in European navies during the year, as well in the various devices for cooling the magazines, a new system for which was installed on the battleship *Iowa*, and was to be extended to the United States battleships. In the 8-inch and 12-inch guns in service, which were not hooped to the muzzle, it was found necessary to replace them by guns of a later and stronger design. Originally designed for brown powder or for smokeless powder before the day of increased muzzle velocity and pressure, they were deemed inadequate for modern conditions of service. When withdrawn from service they were to be hooped to the muzzle, and after being relined, where necessary, were to be held as reserve guns. An important test took place on June 13th, when a torpedo attack was made on the monitor *Florida*, to determine the value of the specially constructed water-tight compartment. Previously a 12-inch gun test against the *Florida's* turret had been held on May 27th, and also an attack against the skeleton mast, which was considered to demonstrate the efficiency of this form of construction. The torpedo carried a charge of gun-cotton weighing 220 pounds, and was guided by a trolley wire so that it could not miss its mark. Striking just below the armored belt amidships, it went through the coal bunker into a water-tight compartment. The experiments with the *Florida* were all considered very successful and

added materially to the practical data of the navy department. Many problems were worked out during the cruise of the Atlantic fleet, which was considered successful from a technical, as well as a national, standpoint. This will be found discussed in the article UNITED STATES under *Navy*. See BATTLESHIPS; TORPEDOES.

NEBRASKA. One of the North Central Division of the United States. Its area is 77,530 square miles. The population, according to a Federal estimate made in 1908, was 1,069,214.

MINERAL PRODUCTION. The mineral resources of Nebraska are in course of development. There is one fairly good coal mine in operation, and a few others are projected. Two silica deposits are being worked and the indications are favorable for a heavy output in both, one being considered of such value that \$40,000 has been spent building a railroad line to it. Sand and gravel deposits are considered inexhaustible, and there is a considerable amount of good stone in sight. Clay for good brick is plentiful throughout the State, and the product is increasing in value each year. Boring for oil was in progress in several localities in 1908. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$1,383,916, as compared with a value in 1906 of \$2,053,100.

AGRICULTURE AND STOCK RAISING. The total area in acreage in Nebraska in 1908 showed a falling off of 2,178,773 acres, as compared with the figures for 1907. This was explained in part by the late and wet spring. Much of the bottom land that in normal years produced heavily was

in 1908 left unsown and a substantial percentage of such land that was sown later was lost by reason of continued floods. Washouts on hill-sides and sloping lands also accounted for a considerable part of this decreased acreage. The acreage of various cereals for 1908, with figures for 1907 in parentheses, was as follows: Corn, 6,339,019 (6,586,844); winter wheat, 2,342,508 (2,279,767); spring wheat, 203,102 (248,572); oats, 2,353,839 (2,494,946); barley, 95,758 (95,373); rye, 86,614 (87,913). Of potatoes there was an acreage in 1908 of 100,277, as compared with 87,900 in 1907, and 67,850 acres of sorghum cane, as compared with 70,017 in 1907. The number of orchard trees in 1908 is as follows, with the corresponding figures for 1907 in parentheses: Apples, 3,706,110 (3,546,859); pears, 108,436 (101,838); peaches, 1,988,011 (1,991,992); plums, 594,689 (636,889); cherries, 724,153 (706,209). The total acreage in the farms of the State in 1908 was 26,516,052, of which 12,562,746 acres were under cultivation. There were in the State in 1908 534,646 milch cows, and 1,688,936 other cattle; 2,073,812 hogs; 268,585 sheep, and 717,022 horses and mules. The production and value of the principal crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 205,767,000 bushels, valued at \$104,941,000; winter wheat, 40,317,000 bushels, valued at \$33,866,000; spring wheat, 3,978,000 bushels, valued at \$3,342,000; oats, 56,078,000 bushels, valued at \$22,922,000; barley, 2,773,000 bushels, valued at \$1,276,000; rye, 1,360,000 bushels, valued at \$816,000; buckwheat, 18,000 bushels, valued at \$15,000; flaxseed, 165,000 bushels, valued at \$185,000; potatoes, 7,098,000 bushels, valued at \$3,904,000; hay, 2,348,000 tons, valued at \$1,515,000. The value of the wool clip in 1908 was estimated at \$334,125.

MANUFACTURES. An attempt was made by the State Bureau of Labor and Industrial Statistics to obtain manufacturing statistics for 1907, but this was not entirely satisfactory. Reports received from 494 concerns, probably two-thirds of the total number in the State of any consequence, reported output to the value of \$152,000,000 in round numbers. The cost of raw material was \$81,416,998; the wage-earners numbered 14,000; the wages amounted to \$8,500,000; and the capital invested was \$43,569,675. The special census of 1905 showed 20,260 wage-earners engaged in factories with products valued at \$154,918,000, these two figures exceeding those of 1900 by 8.5 and 18.9 per cent., respectively. Of the wage-earners only 2,542 were women, and only 397 children under 16. Slaughtering and meat packing, centred at South Omaha, represented a value of \$69,243,400, or 2.5 per cent. less than in 1900. The State ranked third in this industry, being surpassed by Illinois and Kansas. Other principal industries, and their percentage gains over 1900, in parentheses, were: Flour and grist mill products, \$12,190,000 (56.4); printing and publishing, \$4,973,900 (44.9); railway repair-shop work, \$4,394,600 (67.5); and cheese and butter, \$3,326,100 (47.6). Of the total value of products, South Omaha produced \$67,415,000; Omaha, \$54,003,700, and Lincoln, \$5,222,600.

EDUCATION. The school population of the State (ages 5 to 21) was, in 1907, 372,648. The total enrollment was 277,166, and the average daily attendance 186,321. There were 6,783 school districts, and 6,784 school buildings, employing 10,059 teachers. Of the teachers 87 per

cent. were women. The average monthly salary of men teachers was \$66.01, and of women, \$46.16. The average length of school term was 141 days. In 330 districts the term was less than three months. The total expenditures for school purposes was \$5,759,222. A law of 1907 raised the standard for private and denominational schools permitted to grant certificates, and raised the minimum entrance requirements of State normal schools to two years of high school education. Other laws passed in the same year provided for four years of free high school opportunity for every child completing the elementary work, tuition to be paid by districts not having four-year high schools; for the establishment of a library in every school district; for normal training in high schools; for increase of junior normal schools from 5 to 8; for State aid to weak districts, \$50,000 being appropriated therefor. The aim of the last provision is to insure at least seven months of school in every district.

POLITICS AND GOVERNMENT. There was no session of the State legislature in Nebraska in 1908. The extension of the prohibition area in the State during the year was a notable feature of its political history. In the elections held on April 7th, local option made a gain of more than forty towns. There were elections in every city and town except Omaha, and in almost every one the sole issue was license or no license. A vigorous campaign had been carried on by the Prohibitionists, and the result was shown in the large vote which was cast in almost every place. In most cases the issue was determined by a referendum vote. The struggle in Lincoln was particularly strong. The Excise Board in that city had adopted stringent regulations, which were little short of actual prohibition. In spite of this, the prohibition people fought hard for complete "no license." They lost by a margin of 221 votes. An interesting decision was rendered by Attorney-General Thompson on Jan. 1st in connection with the attempt made by Governor Sheldon to turn over part of his salary to Lieutenant-Governor Hopewell for services rendered by the latter during the absence of the Governor from the State. The Attorney-General declared that inasmuch as the salary of the Lieutenant-Governor was fixed by law, and he was prohibited from accepting any other amount, Governor Sheldon must draw the full salary.

CONVENTIONS AND ELECTIONS. The Democratic State Convention for the selection of delegates to the National Convention met at Omaha on March 5th. The platform adopted by the convention had more than a local interest for the reason that it was generally considered that it was prepared under Mr. Bryan's special supervision, and that it represented the issues which he wished to make prominent during the presidential campaign. Among the measures advocated were the election of U. S. Senators by direct vote, postal savings banks, a currency plan that should include an emergency currency, issued and regulated by the federal government, an 8-hour day, and an employers' liability law. Revision of the tariff was demanded, and the right of Congress to exercise complete control over interstate commerce was asserted. The delegates chosen were instructed to vote for William J. Bryan for President. The Republican State Convention for the selection of delegates to the National Convention met at Omaha on March 12th. A platform strongly indorsing the admin-

istrations of President Roosevelt and Governor Sheldon was adopted, and the delegates chosen were pledged to vote for William H. Taft for President. The results of the election on April 7th are noted in the paragraph above. On Sept. 1st, the first primary election was held under the primary law of 1907. The chief interest was among the Democrats, as there was little opposition among the Republicans to the men then in office. The chief contestants for the Democratic nomination for Governor were James H. Dahlman, Mayor of Omaha, and Ashton C. Shallenberger. In spite of a large vote cast for Dahlman in Omaha, he was defeated, and Shallenberger became the Democratic nominee for Governor. The Republicans renominated Governor George S. Sheldon. In the election of Nov. 3d William J. Bryan received a plurality in the State over William H. Taft of about 5,000. Mr. Bryan had made a particularly aggressive canvass throughout the State, and it was probably largely due to his efforts that the Republican plurality of 1904 was turned to a plurality for the Democratic candidate in 1908. The Legislature is overwhelmingly Democratic. The vote of the State is as follows: Bryan, 131,099; Taft, 126,997; Chafin, 5,179; Debs, 3,524. For Governor, Shallenberger, 132,960; Sheldon, 121,076.

OTHER EVENTS. The State was visited by several windstorms and tornadoes in April and May. On April 23d a tornado swept over Cuming and Thurston counties, killing three persons and destroying a number of houses. A severe tornado swept over Platte River valley in the eastern part of the State on May 12th, causing great damage in a dozen towns. The town of Fort Crook was totally destroyed and Bellevue College, the Presbyterian University of the West, was left in ruins. At Louisville four persons were killed and the town was practically destroyed. On May 15th, the plant of the Omaha Packing Company, at Omaha, was burned, causing a loss of approximately \$400,000. The Cudahy Packing Company suffered a loss of about \$100,000.

STATE OFFICERS. Governor, A. C. Shallenberger, Dem.; Lieutenant-Governor, M. R. Hopewell; Secretary of State, George C. Junkin; Treasurer, L. J. Brian; Auditor, Silas A. Barton; Attorney-General, W. T. Thompson; Superintendent of Education, E. C. Bishop; Commissioner of Public Lands, E. B. Cowlds—all Republicans, except Shallenberger.

JUDICIARY. Supreme Court: Chief Justice, John B. Barnes; Justices, Chas. B. Letton, Jesse B. Root, Jacob Fawcett, William B. Rose, and M. B. Reese; Clerk, H. C. Lindsay—all Republicans.

The State Legislature of 1909 is composed of 13 Republicans and 20 Democrats in the Senate, 31 Republicans and 69 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES under the section Congress.

NEBRASKA, UNIVERSITY OF. An institution of higher learning at Lincoln, Nebraska, founded in 1869. The attendance in 1907-8 was 3,237, distributed as follows: Literature, science, and arts, 1,050; agriculture, domestic science and mechanic arts, 1,197; music, 493; summer session, 258; law, 183; medicine, 127; fine arts, 101. Three new buildings for the School of Agriculture were finished during the year, a Woman's Building, the Stock Judging Pavilion and the Veterinary Building. The following new

departments of the University were created: Teachers' College and School of Pharmacy, the latter forming part of the College of Medicine. The office of Director of University Extension was created to go into effect Jan. 1st, 1909. The endowment of the University approximates \$1,500,000, and the annual income \$625,000, chiefly from the State. The Library contains 80,000 volumes. On Nov. 6th, 1908, Dr. E. Benjamin Andrews resigned the Chancellorship of the University on account of ill health. He terminated eight years of service on Jan. 1st, 1909. The Regents on Dec. 8th elected Dr. Samuel Avery, head professor of chemistry, to be acting Chancellor.

NECROLOGY. The following list comprises the names of persons who died in the year 1908. An asterisk denotes that an obituary of the person appears as a separate article in its alphabetical order:

*Abbott, Edward. American clergyman and author.

Ackley, Seth M. American rear-admiral. Died, Jan. 7th.

*Adler, Friedrich. German architect and writer.

*Aiken, William Martin. American architect.

*Alden, William Livingston. American author and journalist.

*Alexis, Alexandrovitch. Grand Duke of Russia.

*Allen, Alexander Virts Griswold. American Episcopalian minister and theological writer.

*Allison, William Boyd. United States Senator.

*Amicis, Edmondo de. Italian writer.

Anderson, Sir Thomas McCall. Scotch dermatologist. Died, Jan. 25th; born, 1836.

*Anthony, William Arnold. American physician.

NELSON, HENRY LOOMIS. An American journalist and economist, died in New York City, on Feb. 29, 1908. He was born in that city on Jan. 5, 1846, and was educated at Williams College, and also at Columbia, where he graduated in law. He was admitted to the bar in 1869, practised until 1878, was Washington correspondent of the *Boston Post* in 1878-85, editor of that paper in 1885-86, an editorial writer for the *New York World* in 1889, and editor-in-chief of *Harper's Weekly* in 1894-98. He became professor of political science at Williams College in 1902, and held that position during the remainder of his life. As a journalist, Mr. Nelson strongly advocated political independence, the gold standard and civil service reform, and he remained an ardent admirer and supporter of Mr. Cleveland. As a teacher, he was very successful at Williams. He published: *Our Unjust Tariff Law* (1884); *John Rantoul*, a novel (1884); *The Money We Need* (1896).

NETHERLANDS, THE, or HOLLAND. A Kingdom of Western Europe, covering an area of 12,741 square miles. The population numbered 5,104,137 on Dec. 31, 1899, and was estimated at 5,747,269 on Dec. 31, 1907. The movement of population in 1907 was as follows: Marriages, 43,375; births (exclusive of 7,171 still-births), 178,677; deaths, 90,521; emigration, 4,393. Cities with over 50,000 inhabitants on Dec. 31, 1907, were: Amsterdam, 565,656; Rotterdam, 403,356; The Hague, the capital, 254,504; Utrecht, 114,895; Groningen, 74,272; Haarlem, 70,152; Arnhem, 63,113; Leiden, 57,559; Nimeguen, 52,213.

EDUCATION. Since 1900 primary education has been compulsory from 6 to 13 years of age. The cost is borne jointly by the State and communes. Private, or sectarian, education is also supported from public funds. In 1906 there were 157 public infant schools, with 27,291 pupils, and 1,001 private infant schools, with 95,201 pupils; 3,255 public elementary schools, with 567,764 pupils, and 1,687 private elementary schools, with 289,371 pupils; 84 middle class schools, with 12,558 pupils; 30 classical schools, with 2,026 pupils; a polytechnicum, with 1,176 pupils; 11 navigation schools, with 837 pupils; 4 public universities, with 3,384 students (427 female), and one private university. Besides these there is also a large number of special agricultural, horticultural, military, and normal schools, a national academy of art, a royal school of music, etc. Day and night schools for working people numbered 256, with 29,084 pupils.

PRODUCTION. In 1907 there were employed in the North Sea herring fisheries, 777 boats, of which 45 were steamboats, with about 10,000 men. The catch amounted to about 794,242 barrels (about 870 herrings to each), against 745,590 barrels in 1906. But the value of the 1907 catch was less than in 1906, the average price per barrel being \$4.80, against \$6.40 in 1907. The low price of 1907 was ascribed to the in-

creased catch of the English, Scotch, and German fisheries. Germany takes the greater part of the Dutch catch.

Coal is the only mining product. In 1906 the coal production was 564,238,000 kilos (1 kilo = 2.205 lbs.), valued at 2,665,000 guilders (1 guilder or florin = 40.2 cents). The State owns several mines. Turf or peat is cut in large quantities.

The cultivated land covered in 1906 2,388,964 hectares (1 hectare = 2.47 acres), distributed as follows: Arable land, 860,657; pasture, 1,198,006; gardens and orchards, 73,712; forest, 256,589. The principal crops are rye, oats, potatoes, wheat, barley, beans, peas, buckwheat, carrots, flax, and sugar-beets. The production of rye in 1907 was 14,494,600 bushels. The wheat production in 1906 was 4,978,000 bushels; in 1907, 5,329,150 bushels. The production of oats in 1906 was 19,588,000 bushels; in 1907, 20,000,000. The production of sugar-beets in 1907-8 was 1,142,000 metric tons; in 1908-9, 1,356,000. The production of beet-sugar in 1907-8 was 166,500 metric tons; in 1908-9, 197,400. Cereals and flour have to be largely imported, while vegetables are exported. In 1907 there were imported 932,478 barrels of wheat flour from the United States, 585,416 from Belgium, and 238,112 from Germany, as against 1,224,933 from the United States, 585,416 from Belgium, and 238,207 from Germany in 1906. During 1908 the United States continued to lose, and Belgium and Germany to gain in this respect. The gain of Germany is ascribed to the law which went into effect on Mar. 1, 1906, allowing the free importation into Germany of wheat destined for export as flour. A characteristic industry of the Netherlands is the growing of tulip and hyacinth bulbs, which attain perfection only in the small space of territory between the cities of Leiden and Haarlem. This stretch of land was formerly the bottom of the old Haarlem Sea, which was laid dry about 1852, and amounts to about 10,027 acres. The export of bulbs and bulbous roots in 1907 was 33,610,280 pounds, of which 6,214,120 went to the United States, 13,950,200 to Great Britain, 8,728,720 to Germany and Austria-Hungary, 2,307,360 to the three Scandinavian countries, and 793,100 to Russia. As an indication of the growth of this export within recent years, it may be mentioned that in 1897, the export was 12,543,955 pounds, and in 1905, 25,640,340 pounds.

In the year ending Aug. 31, 1908, there were in the cotton mills 396,160 spinning spindles, and the consumption of cotton was 77,326 bales, of which 57,876 was American and 18,710 East Indian. The number of ships built in 1907 was 321, of 144,991 tons.

FOREIGN COMMERCE. The imports and exports in 1907 amounted to 2,671,700,000 and 2,212,100,000 florins respectively, against 2,523,500,000 and 2,083,900,000 respectively in 1906. The great classes of imports and exports in 1907 were as follows, in florins:

	Imports	Exports
Foods	680,400,000	686,400,000
Raw materials	1,065,800,000	779,000,000
Manufactures	501,600,000	413,600,000
Unclassified merchandise	389,300,000	319,400,000
Precious metals	34,600,000	13,700,000

The transit trade amounted in 1906 to 7,825,000,000 kilograms. The principal imports in 1906 were: iron and steel and their manufacture, 311,626,000 florins; textiles, raw and manufactured, 150,311,000; cereals and flour, 428,563,000; coal, 82,307,000. The principal exports in 1906 were: iron and steel and their manufactures, 207,389,000 florins; textiles, raw and manufactured, 104,259,000; cereals and flour, 256,561,000; margarine, 55,143,000; sugar, 64,140,000; vegetables, 45,000,000. The special trade with the principal countries of origin and destination in 1907 was as follows, in florins:

	Imports	Exports
Great Britain	322,600,000	430,900,000
Germany	599,600,000	1,159,700,000
Belgium	285,500,000	285,000,000
Russia	209,000,000	12,100,000
Rumania	71,700,000	3,400,000
Spain	81,200,000	6,500,000
Dutch East Indies	436,800,000	82,200,000
British East Indies	61,700,000	2,600,000
United States	294,300,000	86,600,000

In August, 1908, a commercial agreement was concluded between the Netherlands and the United States, which is to continue in force until Aug. 12, 1909, when either party shall notify the other of its further intention. The Netherlands agreed to admit American meat products at certain specified rates of duty, and the United States agreed to admit Dutch brandies and other spirits at a specified reduced duty.

COMMUNICATIONS. The Dutch merchant marine consisted on Jan. 1, 1908, of 292 steamers and 435 sailing vessels. In 1908 three leading steamship companies trading in the Dutch East Indies formed a combine for the purpose of establishing new lines, raising new capital, fixing freight rates, purchase of coal, insurance, and mutual support in competition with other companies. The combined fleet consisted of 90 steamers, of 244,000 registered tons, and it was shortly to be increased by 12 steamships, of 44,000 tons, then in construction. The trust company, entitled "Nederlandsche Stoomvaart Unie," has received from each of the three companies, shares to the value of 1,000,000 florins.

The length of railway on Jan. 1, 1908, was 1,934 miles; of State telegraph lines in 1907, 4,481 miles.

BANKS. The note circulation of the Bank of the Netherlands, the only private bank of issue, in 1907, was 259,552,000 florins. The postal savings banks had, in 1906, 139,683,000 florins of deposits due to 1,259,681 depositors.

FINANCE. The budget estimates of revenue and expenditure for 1909 were 184,728,351 and 200,576,140 florins respectively. The principal estimates of revenue were: Land, personal, and income taxes, 42,470,000 florins; excise, 57,260,000; stamps, registration, and succession taxes, 27,429,300; customs, 11,821,000; posts and telegraphs, 18,118,000; railways, 4,188,140. The principal estimates of expenditure were: Civil list, 863,750 florins; war, 27,485,299; navy, 19,734,981; public works, 35,219,387; public debt, 36,596,133; colonies (central administration), 2,855,320. The public debt at the beginning of 1909 stood at 1,128,179,300 florins.

ARMY AND NAVY. The Army is intended for home defense only and is really a sort of mod-

fied militia, with permanent staffs, cadres of officers and non-commissioned officers. Of the rank and file as many as possible are obtained by voluntary enlistment, and the remainder, by far the larger part, by conscription. The annual contingent is limited to 17,500, of whom 400 are assigned to the naval service. Of the army contingent, 11,800 serve in the ranks for 8½ to 12 months in the dismounted and 18 months to 2 years in the mounted branches. The remaining 5,300 conscripts serve four months in the dismounted branches. There are 12 regiments of infantry; 4 regiments hussars; 4 regiments field artillery; 1 division horse artillery; 4 regiments garrison artillery; and 1 regiment engineers, including sub-marine mine, pontoon, railway and telegraph companies. The war strength is 3,775 officers and 175,216 men of which 78,000 belong to the field army, 69,000 to the fortress troops and 31,000 to the territorial defense troops. The peace strength of the army was 542 officers and 20,645 men, and the annual military budget for 1908 was 57,830,000 francs. The infantry is armed with the Mannlicher rifle, cavalry with a carbine of the same make, and the field artillery with a rapid fire Krupp gun. The Schwarzlose machine gun was adopted for cavalry troops, and portable search-light sets were provided for the mobile army in 1908.

The effective navy at the beginning of 1908 consisted of 5 third-class battleships, aggregating 26,130 tons; 4 armored coast defense vessels, 13,000 tons; 8 protected small cruisers, 30,300 tons; 1 unprotected small cruiser, 1,300 tons; 13 gunboats, 9,683 tons; 45 torpedo boats, 4,490 tons. Total, 76 ships of 84,903 tons, besides 1 submarine, with crews numbering 6,548. In 1907 the increase in tonnage was 290.

GOVERNMENT. Queen Wilhelmina Helena Pauline Maria, born Aug. 31, 1880, succeeded her father on Nov. 23, 1890. The cabinet of Feb. 12, 1908, consisted as follows: Foreign Affairs, Dr. J. Khr. R. de Marees van Swinderen; Interior, Dr. Th. Heemskerk; Justice, Dr. H. P. L. Nelissen; Navy, Vice-Admiral J. Wentholt; Army, Lieut.-Gen. F. H. A. Sabron; Finance, Dr. M. J. C. M. Kolkman; Waterways, Dr. J. G. S. Bevers; Agriculture, Industry, and Commerce, A. S. Talma; Colonies, A. W. F. Idenburg.

HISTORY. The dispute with Venezuela was the principal event in the foreign relations of the Netherlands during 1908. Early in the year the bubonic plague broke out in La Guayra, the port of the Venezuelan capital. Curaçao, the Dutch colony in the West Indies, thereupon established a quarantine against Venezuelan ports. About the same time, President Castro of Venezuela requested the Dutch government to put a stop to the smuggling of contraband, including arms, from Curaçao into Venezuela and to take steps to obstruct the filibustering plans of Venezuelan refugees in Curaçao. To this communication M. J. H. de Reus, the Dutch minister at Caracas, replied on April 9. He explained that his government could not carry out all of President Castro's wishes and added that the Venezuelan government had been misinformed by its consul at Willemstad, the capital of Curaçao, who had gone to the island with strong prejudices against it. The references to his consul are believed to have exasperated Castro, and on May 14 he issued a

decree, suppressing all traffic in Dutch vessels between Venezuela and Curaçao and ordering that all goods usually transhipped at Curaçao should henceforth be transhipped at Puerto Cabello. Other measures taken against the Dutch West India Islands were the seizure of four Dutch vessels plying between the islands of Curaçao and Aruba, the imprisonment of their crews, the opening of correspondence of Curaçao officials, and the prohibiting of foreign laborers from working on vessels in Venezuelan ports. On July 21 the Dutch Minister at Caracas received his passports from the Venezuelan government. Accompanying the passports was a letter from the Venezuelan minister of foreign affairs, in which M. de Reus was informed that in view of the opinions expressed in his published letter of April 9, President Castro considered him incompetent to serve as a friendly medium between the two governments. Another letter was sent to the foreign minister of the Netherlands, stating that the expulsion of M. de Reus did not alter the existing friendly relations between the two governments, and asking for the appointment of another intermediary.

When the news of the expulsion of M. de Reus reached Curaçao, an angry mob made a violent demonstration against the Venezuelan consul at Willemstad, compelling him to leave the island. To this the Venezuelan government replied by withdrawing the exequaturs of all Dutch consuls in Venezuela. At The Hague the various acts of the Venezuelan government were regarded as incapable of being submitted to arbitration, since they involved questions of sovereignty and national honor, and on July 30 orders were issued to the battleship *Jacob Van Heemskerk* to sail for the Caribbean Sea, to be available if needed in Venezuelan waters. In August the Dutch government was informed by the government of the United States that the latter entertained no objection to a blockade of Venezuelan ports, provided that no Venezuelan territory would be occupied. The Queen was reported to be much averse to war and to desire a peaceful solution of the dispute. Nevertheless it was announced in August that the Dutch naval squadron in the Caribbean would be reinforced in September by the cruisers *Utrecht* and *Holland*. On Sept. 6 an ultimatum was sent to Venezuela, demanding the revocation before Nov. 1 of the decree of May 14, in regard to the transshipment of goods at Puerto Cabello instead of Willemstad. At the same time the Dutch government expressed regret for the conduct of the mob toward the Venezuelan consul at Willemstad. An admission of errors on the Dutch side was also implied in the announcement made upon the arrival of M. de Reus in Holland, that he had been "honorably relieved" of his duties at Caracas.

On Sept. 15 President Castro removed the embargo on the movement of passengers between Venezuela and Dutch West Indian ports, but the principal Dutch grievance remained unheeded. In the first week of December three Dutch warships, the battleship *Jacob Van Heemskerk* and the cruisers *Friesland* and *Gelderland*, made a demonstration against Venezuela, steaming along the coast from Puerto Cabello to La Guayra. On Dec. 13 the *Gelderland* seized the Venezuelan coast-guard vessel *Alis* near Puerto Cabello, and on the following day the

Venezuelan coast guard vessel *23 de Mayo* was captured without resistance. Meanwhile President Castro, who had left for Europe, was replaced by Vice-President Gomez. The latter revoked the transshipment decree and on Dec. 23 orders were sent to the Dutch warships off the Venezuelan coast to cease hostile action.

On Jan. 25, 1908, the Liberal ministry fell as a result of the rejection by the Second Chamber of the war budget, which reduced the effective strength of the army. It was succeeded by the Conservative ministry, the composition of which is given above under *Government*. In September the Queen celebrated her twenty-eighth birthday and the tenth anniversary of her formal accession to the throne.

NEVADA. One of the Western Division of the United States. Its area is 110,590 square miles, of which 860 square miles consist of water. The population in 1908, according to federal estimate, was 42,335.

MINERAL PRODUCTION. Information for the six months ending June 30, 1908, indicated that the number of tons of ore mined for the first six months of the year was 253,982, with a total value of \$5,785,393.40. Practically every county of the fourteen in Nevada produced ore during this period. Esmeralda county led the State in production. The great camp of Goldfield is in this county. Nye county, which includes Tonopah, was second in production, and Storey county, in which the old Comstock mines are located, ranked third. The total production for the year 1908 is estimated at \$15,000,000. The first six months of the year were marked by depression and labor troubles, but these were adjusted so that the production resumed its normal condition in the latter half of the year. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$22,088,700, as compared with the value in 1906 of \$15,990,663.

Notwithstanding the prevailing dullness in many of the newer mining camps in Nevada in 1908, the larger reduction plants have steadily progressed in development and output during the year. The output of gold has probably remained about stationary, while the production of silver from silicious ores has undoubtedly increased considerably. The notable feature has been the installation of numerous mills by prosperous companies, which thereupon ceased shipping to distant smelters. This change has permitted the utilization of large quantities of ore which would not bear both freight and smelter charges, and has resulted also in the adoption of better systems of mining than those employed when rich ore only was hoisted. At Goldfield and Tonopah much development work was carried on during the year. The production of copper on a large scale was begun at Ely. The mining industry of the State was really in much better condition at the end of 1908 than in 1907, notwithstanding the fact that a number of camps have been virtually idle. The Director of the Mint estimates the output of gold in 1908 at \$12,090,218, as against \$15,411,000 in 1907; and the production of silver at 9,322,828 fine ounces, as against 8,280,500 in 1907.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm

crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Spring wheat, 990,000 bushels, valued at \$1,119,000, from 33,000 acres; oats, 315,000 bushels, valued at \$205,000, from 7000 acres; barley, 240,000 bushels, valued at \$185,000, from 8000 acres; potatoes, 360,000 bushels, valued at \$270,000, from 3000 acres; hay, 400,000 tons, valued at \$3,525,000, from 200,000 acres. The yield per acre of wheat was 30 bushels, which is the largest production per acre of any of the States. Many important irrigation projects are being carried on in the State, which will ultimately greatly increase its agricultural development. (See *IRRIGATION*.) Large numbers of sheep are raised in the State. They numbered 1,554,000 in 1908. The wool clipped was 6,000,000 pounds, valued at \$948,600 (estimate).

MANUFACTURES. The value of products manufactured by establishments classed as factories in 1905 was \$3,096,274, or 145.5 per cent. greater than the similar value in 1900. Among the mentionable industries are railway repair-shop works, flouring and grist milling, printing and publishing, and the manufacture of butter and malt liquors.

EDUCATION. At the school census taken in April, 1908, there were reported 12,025 children of school age (6 to 18 years). The total enrollment of the schools of the State was 10,440 and the average daily attendance was 7312. In the year ending Aug. 31, 1908, there were employed 449 teachers. There was spent for school purposes during the summer period \$601,993. The average salary of male teachers was a little in excess of \$112.57 for a month of twenty days, and of female teachers a little less than \$60.96. The average length of the school year was 8.1 months. Several new school houses were built during the year. The building erected at Goldfield cost over \$100,000. The State Legislature of 1907 passed a school law abolishing the office of county superintendent and dividing the State into five educational districts, each having a deputy State superintendent to supervise the schools. The sum of \$240,663.27 was appropriated among the schools. The face value of bonds owned by the State school funds in Oct., 1908, was \$1,875,000.

FINANCE. The report of the State treasurer showed a balance in the treasury Jan. 1, 1908, of \$674,341. The receipts for the year ending Dec. 31, 1908, were \$1,004,040. The total disbursements for the same period were \$875,941, leaving a balance in the treasury Dec. 31, 1908, of \$802,441. The largest expenditure was for the general school fund, \$233,425.

POLITICS AND GOVERNMENT. There was no meeting of the State Legislature in 1908. The conditions brought about by the miners' strike in Goldfield in the latter part of 1907 continued in January, 1908. Governor Sparks had declared early in December that he was unable to preserve order in Goldfield with the power available. He therefore requested that Federal troops be sent, as Nevada has no State militia. President Roosevelt acceded to this request and dispatched General Funston with a body of regular troops to Goldfield. At the same time he appointed a commission to make an investigation as to the necessity of Federal aid. The situation did not seem critical to members of this Commission, and the President, on Dec. 20, ordered that all troops be withdrawn on Dec. 30.

This action, however, met with strong protest on the part of Governor Sparks, who said that the miners were armed and that if the Federal troops were withdrawn a general conflict would become imminent. The President extended the time that the troops would be allowed to remain at Goldfield three weeks beyond Dec. 30. On Jan. 14, the Governor issued a call for a special session of the Legislature to provide means for maintaining the State's authority within its own borders. On Jan. 4, President Roosevelt wrote to Governor Sparks, giving a résumé of the report of the Commissioners, who declared their belief, after a careful investigation on the ground, that there was no warrant whatever for calling upon the President for troops, and that the troops should not be kept indefinitely at Goldfield. The report further declared that there were no conditions existing in the State warranting interference by the Federal government, and that an effort was being made by the State of Nevada to secure the performance by the United States of the ordinary police duties which should be performed by the State itself. The Legislature, which had been called in special session by Governor Sparks, passed, in the latter part of January, a bill for the organization of a State police force, which should do away with the necessity of employing Federal troops in case of disorder. Following this action the Federal troops were withdrawn. (See **STRIKES**.) On April 25, the Supreme Court of the State handed down a decision declaring the boycott in all forms illegal, and making it possible for injured parties to recover damages against any individuals or corporations instituting a boycott. In the case at issue the Industrial Workers of the World together with the Goldfield Miners' Union had declared a boycott against a newspaper published at Goldfield. A decision of the lower court that the union, being an unincorporated body, could not be sued, was reversed. On May 22, John Sparks, the Governor of the State, died at Reno. On Oct. 24, an election was held at Reno to determine whether or not gambling should be permitted in that city. The Anti-Gambling League made a strong campaign and great public interest was shown in the election. The attempt to close the gambling places was defeated by a vote of 2010 to 1209.

CONVENTIONS AND ELECTIONS. The Republican State Convention for the selection of delegates to the National Convention met on April 21, and the delegates chosen were instructed to vote for William H. Taft for President. The Democratic State Convention, on June 2, selected delegates to the National Convention, instructed to vote for William J. Bryan. In the election of Nov. 3, Nevada was carried by the Democratic party, by a plurality of about 500. The Legislature remains Democratic, which insures the reelection of Senator Francis G. Newlands. The detailed vote was as follows: Bryan, 11,212; Taft, 10,777; Debs, 2203; Hisgen, 435.

OTHER EVENTS. On June 19, a statue of John W. Mackay, presented by Clarence H. Mackay and his mother, was dedicated at the Mackay School of Mines at Reno. The dedicatory address was made by Colonel George Harvey of New York. On Sept. 4, the mining town of Rawhide was partly destroyed by fire, causing a loss of \$750,000. From 2000 to 3000 people were made homeless and several were severely

injured. The rebuilding of the town was immediately begun.

STATE OFFICERS: Governor, vacancy; Lieutenant-Governor and acting Governor, D. S. Dickerson; Secretary of State, W. G. Douglas; Treasurer, D. M. Ryan; Comptroller, Jacob Eggers; Superintendent of Public Instruction, Orvis Ring; Attorney-General, R. C. Stoddard—all Democrats, except Eggers, Ring and Douglas, Republicans.

JUDICIARY: Supreme Court; Chief Justice, Frank H. Norcross, Rep.; Justices, George F. Talbot, Dem.; W. G. Douglas, Dem.; Clerk ex-officio, Eugene Howell, Dem.

The State Legislature of 1909 is composed of 11 Democrats, and 14 Republicans in the Senate, 19 Democrats and 16 Republicans in the House. The State representation in Congress will be found in the article **UNITED STATES**, under the section *Congress*.

NEW BRUNSWICK. A maritime province of Canada. Area, 27,985 square miles. Population in 1901, 331,120. Fredericton, the capital, had 7117 inhabitants in 1901. For details respecting population, education, production, commerce, etc., see **CANADA**. The provincial government consists of a Lieutenant-Governor, appointed by the Governor-General of Canada, and acting through an executive council, or responsible ministry, and a unicameral House of Assembly of 46 members, elected for four years. The present Lieutenant-Governor is Lemuel John Tweedie, appointed March 2, 1907. The Premier is J. Douglas Hazen.

HISTORY. The leading event of 1908 was the provincial elections, which were held in March, and resulted in the defeat of the Liberal government of Hon. C. W. Robinson. The Conservatives, led by Hon. J. D. Hazen, were returned to power for the first time in twenty-five years. The new ministry is as follows: J. D. Hazen, Premier and Attorney-General; J. K. Flemming, Provincial Secretary; John Morrissey, Commissioner of Public Works; W. C. H. Grimmer, Surveyor-General; D. V. Landry, Commissioner of Agriculture; H. F. McLeod, Solicitor-General; Robert Maxwell, without portfolio. It was noteworthy that about a month before the elections, committees of the government and opposition met at St. John, and agreed to run the elections without bribery or use of money except for legitimate expenses. Premier Hazen excited much comment by taking part in the Dominion elections campaign, and by making serious charges against Hon. Dr. Pugsley, Minister of Public Works at Ottawa. Mr. Hazen was not successful in proving the charges.

NEW CALEDONIA. An island in the Pacific, the southernmost of the Melanesian Islands. With the Loyalty Islands to the east, and the Isle of Pines to the southeast, it constitutes a French colony. Total area, 7652 square miles; population (1906), 53,346, including 22,177 whites, 3336 colored immigrants, and 27,833 natives. The colony contains a penal settlement, and convicts form a large proportion of the white population, but no convicts have been sent there since 1898. The colored immigrants, brought under contract, include Chinese from Annam, Japanese, and Kanakas. Nouméa, the capital, had 9968 inhabitants in 1901. About half of the area is mountainous, one-fourth pasture, one-fourth cultivated or cultivable, and about 500 square miles are covered

with forest. The agricultural products include wheat, maize, sugar, coffee, tobacco, grapes, pine-apples, and manioc. Mining employs some 3500 workmen, mostly Japanese. In 1907, the nickel production amounted to 101,707 metric tons, against an export of 130,688 tons in 1906; the chrome export, 31,552 tons, against 57,367 tons in 1906, there being large stocks of chrome, aggregating some 65,000 tons, in the island; the cobalt export, 3942 tons, against 2487 tons in 1906; the copper production, 437 tons. The cobalt export has decreased in recent years, due to the competition of Canadian cobalt. Pockets of gold, in some of which the precious metal runs as high as an ounce to the ton, continue to be found. Small quantities of titanium have also been found. There are large deposits of iron ore, but it is all chromic and at present smelters try to avoid it. Antimony, coal, and mercury are found, but have not yet attained importance. The imports and exports in 1907 amounted to 9,410,485 and 8,504,164 francs, respectively, the trade with France being represented by 4,947,000 francs of imports and 2,625,000 francs of exports. The imports are mainly foods, textiles, iron manufactures, and machinery; the exports, besides those mentioned above, include copra, coffee, mushrooms, wine, rubber, sandalwood, and hides. In 1908 there were 11 miles of railway, from Nouméa to Dumbéa. Telegraphs have a length of over 635 miles. The colony is administered by a governor, assisted by a privy council and an elective general council. The military force in 1908 consisted of 504 Europeans. The budget for 1907 balanced at 3,974,000 francs. The debt stood in 1907 at 7,560,000 francs. The expenditure of France was fixed for 1908 at 3,213,142 francs, of which 1,709,037 was for the penal establishment. Subject to the authority of the governor are the protectorates of the Wallis Islands, northeast of Fiji, 37 square miles and 4500 inhabitants; the Fortuna and Alofi islands, south of the Wallis group, 61 square miles and 1500 inhabitants; and the Huon Islands, 170 miles northwest of Caledonia, with few inhabitants.

NEWFOUNDLAND. A British colony in North America, consisting of the island of Newfoundland (42,934 square miles), and its dependency, the coast of Labrador (119,000 square miles). In 1901 the population of the island was 217,037; of Labrador, 3634. At the end of 1906 the population of the island was estimated at 228,755; of Labrador, 4023. In 1907 the number of arriving intended settlers was 851; of emigrants, 7029. During the four years, 1904-7, the number of arriving intended settlers was 4008; ordinary travellers, 4886; sportsmen and tourists, 6306; and former residents, 26,293. During the same years the number of transient outward passengers was 16,572, and of emigrants, 27,662. The birth rate in 1906 was 29.6, and the death rate, 20.1 per 1000 population. The population of the principal cities in 1901 was: St. Johns, the capital, 29,594; Harbour Grace, 5184; Carbonear, 3703; Bonavista, 3696; Twillingate, 3542. The school attendance in 1906 was 44,105, of which 15,244 was at Roman Catholic, 14,976 at Anglican, 12,525 at Methodist, and 1360 at other schools. The Roman Catholic, Anglican and Methodist colleges had 354, 204 and 433 students, respectively.

FISHERIES. Fishing is the most important occupation. Of the total population in 1901, 62,674 were engaged in the fisheries, 2475 in agriculture, 1576 in mining, and 3111 were mechanics. The products of the fisheries in 1907 were valued at \$10,058,052; of the mines, \$1,382,793; of the forests, \$494,910. The fisheries may be divided into the Shore, Labrador, Straits and Gulf, and Banks fisheries. The last, at one time the most important, have greatly declined in value. The Labrador fisheries are followed by some 20,000 men. In 1907 the exports of dried codfish amounted to 1,422,445 quintals (the Newfoundland fish quintal = 112 lbs.); cod oil, 4890 tuns; cod liver oil, 51,547 gallons; sealskins, 164,509 in number; seal oil, 5351 tuns; packed herring, 130,878 barrels; frozen herring, 2214 tuns; whalebone, 902 tons; pickled salmon, 4716 tierces (300 lbs. each); fresh salmon, 164,302 pounds. The seal fishery of 1908 was commenced on Mar. 10 and concluded on May 7. The weather during the first four weeks was unusually stormy, and the ice floes heavy. There were brought in 213,813 seals, weighing 4537 tons and valued at \$1,827,089—a decrease of 31,188 seals, 1333 tons in weight, and \$393,028 in value from 1907. The catch of cod in the Labrador fisheries in 1907 exceeded that of 1906, but was unevenly distributed, the catch on the northern part of the coast being very short, while on the southern part it was exceptionally large. The results were exceptionally unprofitable to both fishermen and shippers, for, owing to bad weather and scarcity of salt in some sections, the cod could not be got to market in good condition. Direct shipments of cod from the Labrador coast to European markets in 1907 amounted to 289,493 quintals, valued at \$1,013,227, against 250,887 quintals, valued at \$1,030,432, in 1906. Other shipments from the Labrador fisheries in 1907 were 715 tierces of salmon, valued at \$16,057, and some trout, herring, seal oil, cod oil, and whalebone.

AGRICULTURE AND LUMBERING. Very few people are engaged exclusively in farming. Nearly all fishermen own gardens in which they raise potatoes, turnips, and cabbages for domestic use. Hay, barley, and oats are also grown. In 1901 there were 85,533 acres of cultivated land, 34,000 acres of pasture land, 32,767 cattle, 8851 horses, 78,052 sheep, and 34,767 hogs. The white pine of the forests is of superior quality, and the mainstay of the lumbering industry. The export of lumber in 1906-7 was valued at \$326,581. The Harmsworth Company was constructing in 1908 extensive pulp and paper mills at Grand Falls, on the Exploits River. The export of lumber from Labrador in 1906-7 was valued at \$26,301, and of furs, \$33,487.

MINING. The mineral deposits at present being worked are situated along the sea coast. The vast interior of the island, containing from 4000 to 5000 square miles of mineral-bearing formation, is practically untouched. This formation is rich in copper ore, usually carrying silver, gold, and nickel. Iron pyrites has been mined at Pilley's Island for the past fifteen years, and the supply is yet visible for years. The ore gives 54 per cent. sulphur, and is superior to Spanish pyrites. The annual output of 40,000 tons is shipped entirely to New York. In 1905 the Wabana iron (hematite) mine was opened at Belle Isle, about 12 miles from St. Johns City. This de-

posit is one of the most striking in the world. The land deposit is about three miles in length and has an average width of three-eighths of a mile. The upper bed is from 7 to 9 feet thick and contains about 20,000,000 tons of ore, giving about 54 per cent. of metallic iron. The lower bed runs from 9 to 17 feet in thickness. It is of far greater extent than the upper bed, and contains about 40,000,000 tons of ore, giving 52 per cent. of metallic iron. Development work on the submarine deposits is being carried on. There are two other deposits on the east containing about 1,000,000 tons, and one on the extreme west of the island, the probable estimate of which is between 2,000,000 and 3,000,000 tons. At present the daily output from the Wabana mine is 7500 tons, of which 5000 tons are mined by the Dominion Iron and Steel Company, and 2500 tons by the Nova Scotia Steel and Coal Company. On the mainland, about 18 miles north from Wabana, a deposit of iron ore has been found covering about nine square miles and containing on a conservative estimate from 30 to 40 million tons. The ore runs about 62 per cent. and may be classed as magnetite. A rich copper deposit has been discovered on the southeast side of Red Indian Lake, near the mouth of the Victoria River, on government land. The areas supposed to contain the deposit, extending over 16 miles, have already been taken up by the Harmsworth Company. On the opposite side of the lake a deposit of zinc and galena was said to have been found on land belonging to the Harmsworths. In 1907 the mineral products raised and shipped were as follows: Iron ore from Belle Isle, 864,195 tons, valued at \$950,615; copper ore from Tilt Cove mine, 48,044 tons, valued at \$240,220; pyrites ore from Pilley's Island, 19,920 tons, valued at \$59,760; gold (estimated in copper ore), 3603 ounces, valued at \$74,474; brick manufactured, 500,000, valued at \$4000; building and paving stone, \$3150; giving a total value of \$1,332,219, against \$1,462,344, in 1906. The returns for 1907 are stated to be somewhat incomplete, several of the mine operators having failed to furnish information to the Geological Survey.

FOREIGN COMMERCE. The imports and exports (domestic produce) during the year ending June 30, 1908, amounted to \$11,516,111 and \$11,815,769, respectively, against \$10,426,040 and \$11,910,007 in 1906-7. The principal imports in 1906-7 were: Coal, \$565,208; flour, \$1,529,025; textiles, \$1,612,612; salted beef, \$305,041; salted pork, \$460,231; machinery, \$407,656; hardware, \$300,207. The principal exports in 1906-7 were: Copper, \$278,950; iron ore, \$890,670; iron pyrites, \$184,140; dried cod, \$7,873,172; canned lobsters, \$383,767; pickled herring, \$222,997; cod oil, \$358,713; seal oil, \$447,967; whale oil, \$173,011; sealskins, \$194,300; undressed furs, \$137,850. The trade with the principal countries of origin and destination in 1907-8 was as follows:

From and to	Imports	Exports
Great Britain.....	\$2,668,802	\$1,209,428
Canada.....	4,257,647	1,863,784
Other British colonies.....	357,470	463,359
United States.....	3,858,892	1,177,709
Other foreign countries.....	373,300	7,101,209

COMMUNICATIONS. The tonnage entered and cleared in 1906-7 (excepting coastal) was 1,834,452, of which 988,348 was British. The total number of vessels registered in the colony on Dec. 31, 1906, was 3199, of 135,785 tons, including 63 steamers of 11,194 tons. The length of railway in operation in 1906 was 636 miles, nearly all owned by the government; of telegraph lines, 2988 miles.

GOVERNMENT AND FINANCE. The executive power is vested in a Governor, appointed by the Crown, and an executive council, or Ministry, responsible to the Lower House of the Legislature. The latter consists of a Legislative Council of not more than 18 members, and a House of Assembly of 36 members, elected by manhood suffrage. In 1908 the Governor was Sir William Macgregor; the Premier, Sir Robert Bond. The revenue, derived almost entirely from customs duties, amounted in 1906 to \$2,680,468; the expenditure, \$2,610,391. The customs revenue in 1907-8 was \$2,446,606. The debt of the colony stood on June 30, 1907, at \$22,723,868, of which \$422,000 was a temporary loan due to the Bank of Montreal.

HISTORY. The history of the colony in 1908 was unusually exciting on account of the fall of 50 per cent. in the price of dried codfish, which is 70 per cent. of the exports, and also by reason of the general elections. The Liberal government of Premier Sir Robert Bond was opposed by the People's party, led by Sir Edward Morris, formerly a member of the Bond government, who afterward resigned and, with his following, joined the ranks of the Opposition he now leads. The Legislature was dissolved and general elections were held on Nov. 2. The government appealed for a new lease of power, chiefly in order to champion the colony's right to better terms in controlling the coast fisheries against American fishermen, to secure fuller recognition of its rights as against Canada in regard to the Labrador boundary, and to thwart any political plotting with the view to confederate Newfoundland with Canada. The People's party affirmed the weakness of the Bond government in failing to protect the fisheries, the collapse of its industrial enterprises, and asked for a special representative for Newfoundland at The Hague Tribunal to which the Atlantic fisheries question was to be referred. The election resulted in a deadlock, each side obtaining eighteen seats. At the end of the year the deadlock had not been broken.

NEW GUINEA, BRITISH. See PAPUA.

NEW GUINEA, GERMAN. See GERMAN NEW GUINEA.

NEW HAMPSHIRE. One of the North Atlantic Division of the United States. Its area is 9341 square miles, and its population in 1908, according to federal estimate, was 439,634.

MINERAL PRODUCTION. The principal mineral products, in the order of their value, are granite, clay products, coal products, mineral waters; also, unclassified, mica, pottery, precious stones, and whetstones. The aggregate value of all was \$2,028,638 in 1905, \$2,247,927 in 1906, and \$1,390,360 in 1907.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in the State in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 1,092,000 bushels, valued at \$863,000, from 28,000 acres; oats, 398,000

bushels, valued at \$235,000, from 13,000 acres; barley, 48,000 bushels, valued at \$38,000, from 2000 acres; buckwheat, 43,000 bushels, valued at \$34,000, from 2000 acres; potatoes, 1,900,000 bushels, valued at \$1,387,000, from 19,000 acres; hay, 589,000 tons, valued at \$9,924,000, from 640,000 acres; tobacco, 178,200 pounds, valued at \$24,948, from 99 acres. The acreage and production of farm crops has changed little in the last few years. All kinds of farm animals, except neat cattle, have increased slightly. The number of dairy cows in 1908 was 124,000. The estimated value of the wool clip in 1908 was \$95,480.

MANUFACTURES. The Bureau of Labor in its report for 1907 gathered information from 1824 manufacturing establishments in the State. These show a total investment in all branches of manufacturing industries of \$119,653,209, and a product for the year of \$164,693,442. These establishments gave employment to 62,568 males, 24,694 females, and 986 children under sixteen years. The average weekly earnings for males for all industries was \$12.32, and females, \$7.42. To the male wage earners the total amount of \$30,048,077 was paid, and to females, \$8,305,996. The eleven cities of the State had a manufacturing product of \$106,058,686, or about 65 per cent. of the total for the State. The cities rank as follows in the value of production: Manchester, \$40,397,334; Nashua, \$17,176,439; Concord, \$8,370,981; Dover, \$8,047,024. The bureau urges the need of an equitable factory inspection system in the State. New Hampshire is one of the few States without systematic factory inspection. The commissioner urges also that the scope of the Bureau of Labor be enlarged to include the inspection of factories and workshops with a view to enforcing the child labor law and sanitary regulations, and to securing the wider use of safety appliances for machinery and the proper equipment of buildings used for manufacturing purposes with fire escapes.

FINANCE. The State treasurer's report showed a balance on Sept. 1, 1907, of \$121,306.35; receipts from Sept. 1, 1907, to Aug. 31, 1908, of \$1,868,516.39, and disbursements during the same period of \$1,839,824.10, leaving a balance Sept. 1, 1908, of \$149,998.64. The principal sources of revenue were the State property tax, 28 per cent.; the railroad tax, 35 per cent.; and the savings bank tax, 25 per cent. Smaller proportions came from the legacy tax and life insurance, telephone, and telegraph company taxes. The funded debt, Sept. 1, 1908, amounted to \$706,700.00. Of the total receipts of \$1,868,516.39, only \$905,823.01 was actual revenue; and of the disbursements of \$1,839,824.10, \$968,589.69 was actual expense. Therefore, the expense account exceeded the revenue \$62,766.68.

EDUCATION. The report of the Superintendent of Public Instruction for the fiscal year ended July 15, 1908, shows 2127 schools, 1234 graded schools, and 54 high schools. There were in the State on July 15, 1908, 37,204 boys of school age (5 to 16) and 36,861 girls, or a total of 74,065. The average attendance was 49,398. There were 126 men teachers, with an average salary of \$41.83, and 2529 women teachers, with an average salary of \$36.01. The total revenue for the support of the schools during the year was \$1,683,535, and the total expenditures, \$1,540,123. The Superintendent of Public

Instruction in his annual report urges the necessity of agricultural and industrial education.

CHARITIES AND CORRECTIONS. Among the charitable and correctional institutions of the State are the following, with their population in 1908: New Hampshire Industrial School at Manchester, 176; New Hampshire School for Feeble-Minded Children, Laconia; New Hampshire Soldiers' Home, Tilton, 70. There are also orphans' homes and homes for dependent children and other similar institutions. The report of the State Board of Charities and Corrections for the fiscal year ending Aug. 31, 1908, states that there is but a slight increase in the population of the schools for feeble-minded children, owing to lack of accommodations, and an increase in the number of public charges in orphanages. The new juvenile court law which went into effect July 1, 1907, has attracted much attention in the State and is regarded with favor by those in charge of the institutions. By a legislative act of 1907, a State sanitarium was authorized, and in 1908 a site for this institution was selected at Glen Cliff in the town of Benton.

POLITICS AND GOVERNMENT. There was no meeting of the State Legislature in 1908. The chief political interest during the year was centred in the struggle for the Republican nomination for governor, which in New Hampshire is equivalent to election. The issues were the same as in the State campaign of 1906, when Winston Churchill was a candidate of the anti-railroad element, and Rosecrans W. Pillsbury of the anti-machine forces, for governor, and, while these candidates were unsuccessful, they were able to compel the party to adopt stringent declarations for progressive reform legislation, including the abolition of the free pass, taxation reform, and direct primaries. Only a part of these measures were enacted by the Legislature of 1907, as that body was dominated by the railroad and machine interests. In 1908 the issues between the machine and the "reform" element were not as clearly cut as in 1908, as the machine men adopted reform recommendations. Mr. Churchill was again an aggressive leader in opposition to the railroads, but William E. Chandler, the former United States Senator, was active on the other side, to the surprise of everybody. The "reform" element had as their candidate for governor, Rosecrans W. Pillsbury, a newspaper editor, who aggressively assailed the railroads as a political agent in his paper, and demanded the platform reforms. The machine candidate was Col. Henry B. Quinby, with Bertram Ellis, speaker of the House, as an assistant, to carry local strength on the first ballot. In the convention there was no choice on the first ballot, but on the second Col. Quinby was barely nominated by accessions from the Ellis forces, on Sept. 17. In spite of this defeat, the "reform" element was so strong that the platform of 1906 was repeated, with even more drastic recommendations. Among these were demands for a direct primary law; for the abolition of free passes, and for a readjustment of the scheme of taxing corporations.

CONVENTIONS AND ELECTIONS. The Republican State Convention for the selection of delegates to the National Convention met at Concord on April 21. It was conceded that the sentiment of the party was for William H. Taft

as candidate, but it was deemed inadvisable to instruct the delegates, a majority of whom openly declared Taft preference. A motion declaring the sentiment for Taft was voted down, prominent members of the Taft Club opposing it. Resolutions were adopted in favor of necessary tariff revision. The Democratic State Convention to choose national delegates met at Concord on May 27. A platform of party principles was adopted, and the delegates were instructed to vote for William J. Bryan for president. (For the result of the Republican Convention for the nomination of State officers, see the paragraph above.) The Democratic Convention for the same purpose met at Concord on Sept. 25. Judge George H. Bingham, of Manchester, was nominated for governor, but he at length declined to be the candidate. C. E. Carrs was nominated. A platform was adopted advocating the abolition of the legislative lobby, the initiative and referendum, direct primaries, and other measures. The "hypocrisy of the Republican party in nominating a railroad candidate on a reform platform" was denounced. In the election of Nov. 3, the State was carried for Taft by about 20,000 plurality, while Quinby was elected governor by a majority of about 700. The detailed figures are as follows: Taft, 53,149; Bryan, 33,655; Chafin, 905; Debs, 1209; Hisgen, 583; Quinby, 44,630; Carrs, 41,486.

OTHER EVENTS. In March several large cotton mills in Manchester and Nashua reduced their production 10 per cent. on account of a falling off in demand. A fire in Berlin on Feb. 4 caused damage of over \$200,000.

STATE OFFICERS. Governor, Henry B. Quinby; Secretary of State, Edward N. Pearson; Treasurer, Solon A. Carter; Adjutant-General, Harry B. Cilley; Attorney-General, Edwin G. Eastman; Superintendent of Education, Harry C. Morrison; Secretary Board of Agriculture, Nahum J. Bachelder; Commissioner of Insurance, George H. Adams—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Frank N. Parsons, Rep.; Associate Justices, Robert J. Peaslee, Dem.; Reuben E. Walker, Rep.; John E. Young, Rep.; George H. Bingham, Dem.; A. J. Shurtleff, Rep.

The State Legislature of 1909 is composed of 20 Republicans and 4 Democrats in the Senate, 273 Republicans and 116 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES, under the section *Congress*.

NEW HEBRIDES. A group of islands in the Pacific Ocean, northwest of Australia. Area, about 5100 square miles; population, between 70,000 and 100,000. At the end of 1905 there were 225 British and 417 French settlers. The principal exports are maize, bananas, copra, coffee, kauri-wood, and sulphur. There are several British and French trading companies. Steamers connect with Sydney, Australia; Nouméa, New Caledonia; and the Solomon Islands. The conventions of 1887 and 1888 between Great Britain and France, providing for the government of the islands by a joint commission, were superseded by the convention of Oct. 20, 1906, which went into effect on Dec. 1, 1907. Under this convention the citizens of the two countries enjoy equal rights in every respect. Citizens of other countries must choose between the two jurisdictions. No fortifications or penal settlements are to be established. Public services are

to be undertaken in common. Regulations were made as to lands and recruitment of native laborers. The sale of arms, ammunition, and intoxicating liquors to natives is forbidden. The expenditure for 1908 was estimated at £30,060, one-half being contributed by each of the two Powers. Each country maintains a Resident Commissioner, under whom are the two divisions of the police force, each of equal strength. The seat of the government is Vila, on the island of Efate.

NEW JERSEY. One of the Middle Atlantic Division of the United States. Its area is 8224 square miles, and its population, in 1908, according to federal estimate, was 2,300,427.

MINERAL PRODUCTION. Of the mineral products of New Jersey, clay products are first in value. In 1907 the value of these products was \$16,005,460, as compared with a value of \$17,362,269 in 1906. Of these products, brick and tile were manufactured to the value of \$9,019,834, and pottery to the value of \$6,985,626. New Jersey ranks third among the States in the manufacture of clay products, being surpassed only by Ohio and Pennsylvania. In the production of Portland cement New Jersey ranks second, being surpassed only by Pennsylvania. In 1907, 4,449,896 barrels, valued at \$4,738,516 were produced. The quantity produced in 1906 was 4,423,648 barrels, valued at \$4,445,364. The production of pig iron in 1907 was 373,189 long tons, as against 379,390 long tons in 1906. On Jan. 1, 1908, there were eleven blast furnaces in operation. In the production of mineral water this State showed a large increase in 1907 over the figures of 1906. In the former year there were sold 982,445 gallons, valued at \$105,082, a gain of 397,230 gallons in quantity, and of \$37,896 in value over the figures of 1906. The production of iron ore in 1907 was 549,760 tons, a slight increase over the production of 1906, which was 542,518 long tons. The stone products of the State were valued in 1907 at \$1,523,312, of which the trap rock produced was valued at \$995,436. The production in 1906 was valued at \$1,394,393. The zinc produced in 1907 was valued at \$1,601,614. Among other mineral products were sand and gravel, lime, and glass-sand. According to figures by the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$32,800,299, as compared with a value in 1906 of \$39,854,697.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 10,564,000 bushels, valued at \$7,289,000, from 278,000 acres; winter wheat, 1,868,000 bushels, valued at \$1,887,000, from 108,000 acres; oats, 1,842,000 bushels, valued at \$1,013,000, from 60,000 acres; rye, 1,264,000 bushels, valued at \$1,024,000, from 78,000 acres; potatoes, \$5,256,000 bushels, valued at \$4,678,000, from 73,000 acres; hay, 699,000 tons, valued at \$9,786,000, from 437,000 acres. There has been a tendency in recent years to replace staple farm crops by vegetable and garden products for the supply of numerous markets near which the State is advantageously situated. Fruits and garden truck are largely produced. Among farm animals, dairy cows are the most numerous. In 1908 they numbered 190,000. The esti-

mated value of the wool clip in 1908 was \$55,688.

MANUFACTURES. From the report of the State Board of Statistics for 1908, containing figures for 1907, the following data in regard to manufacturing in New Jersey are extracted: The total capital invested in the State in 1907 was \$729,549,849; the cost of material used, \$462,854,716; the selling value of the products was \$775,186,299; the greatest number of wage-earners employed during the year, 288,811; the average number employed was 280,280; of the wage-earners, 209,859, or 74.8 per cent., were men; 64,613, or 23.1 per cent., were women; and 5808, or 2.1 per cent., were children of both sexes under sixteen years of age. The amount paid in wages to wage-earners only was \$144,740,069. The average yearly earnings were \$517.24. The number of steam engines and other motors in use was 12,072, and the amount of horse power required, 543,359. The value of products of leading industries for 1907 was as follows: Machine shop and foundry products, \$69,665,637; petroleum refining, \$56,864,930; raw silk and ribbons, \$48,568,225; smelting and refining of copper, \$40,320,932; drawn wire and wire goods, \$36,530,847; chemical products, \$28,986,223; rubber products, hard and soft, \$24,482,073; crude products, \$23,713,129; woollen and worsted goods, \$22,826,850; leather, tanned and finished, \$22,756,658; tobacco and cigars, \$20,015,376; brewery products, \$19,313,693; soap and tallow, \$17,595,191; scientific instruments, \$16,462,621; electric appliances, \$15,679,458; hats, men's, \$11,005,025; high explosives, \$10,969,337; paper, \$10,723,971; jewelry, \$10,625,821; pottery, \$6,678,734. New Jersey ranks first in silk goods, copper smelting, and men's soft hats; second in petroleum refining, solid gold jewelry, and fourth in glass. The State also ranks second among the States of the Union in capital invested in manufacturing industry per capita (\$334) and in per capita value of the products (\$362); third in proportion of population (12.5 per cent.) engaged as wage-earners in manufacturing industries, and sixth in the value of the total product of manufactured goods. In the diversity of industries New Jersey is unsurpassed. The geographical position of the State had prepared the way for industrial growth, and the great development of steam and electric lines of railway has been a potent factor in bringing about the result already accomplished. The development of manufactures has also been increased by wise public policy pursued in all matters relating to or affecting industrial interests. In order to indicate the growth of industries in the last two years, it may be stated, according to the United States Census of 1905, which included only industries carried on in factories, the capital invested in manufactures was \$715,060,000. The average number of wage-earners was 266,336, and the value of products was \$774,369,000.

EDUCATION. The school laws were revised in 1903. The State Board of Education consists of two members from each congressional district, appointed for five years. This board appoints county superintendents. Cities have boards of education of nine members, and township, incorporated town, and borough school districts have boards of three to nine members. Attendance is compulsory for all children of ages 7 to 17, inclusive, during the entire school term, except in the cases of children above the

age of 15 years, who have completed the grammar school course and in addition thereto are regularly employed in some useful occupation or service. Text books are free. In 1904 provision was made for a State high school inspector. Manual training and industrial education have been provided in many towns and cities, the State appropriating for such schools in 59 different localities \$90,000 in 1907, and \$95,000 in 1908. The State also maintains the Manual Training and Industrial School for Colored Youth at Bordentown. New Jersey was the first State making provision for an old-age pension system for teachers. The first law, enacted in 1896, made participation in this plan voluntary, but a law of 1907 provided that the retirement fund act should be binding upon all who began to teach in the State public schools after Jan. 1, 1908. The report of the Superintendent showed that the total enrollment in public schools in 1908 was 402,866, and the average daily attendance, 289,167; the enrollment in kindergartens was 26,226; in primary grades, 242,197; in grammar grades, 114,236, and in high schools, 20,207. The teachers numbered 10,279, of whom 9173 were women. There were 558 teachers employed in evening schools in nine cities. The average yearly salary of all teachers was \$697.06. The average duration of the school term was 9.1 months. The total receipts for public school purposes in 1908 were \$17,693,858.03, of which \$1,909,957.55 was the balance from the preceding year, \$3,238,558.28 the State school tax, \$1,079,519.42 the amount appropriated from the State fund, and \$8,036,793.76 the amount of district taxes. The total expenditures were \$14,951,775.24, of which \$7,165,068.04 was for teachers' salaries, \$3,119,196.01 for maintenance and construction of buildings, and \$632,639.07 for text books and apparatus. The cost of education was as follows: Average cost per pupil, based on attendance, \$35.68. Number of school buildings, 1948; total value of school property, \$28,582,358; average value of New Jersey school buildings, \$14,673.

FINANCES. The report of the State treasurer for the fiscal year ending Oct. 31, 1908, shows a balance in the State fund on Nov. 1, 1907, of \$1,320,038. The total receipts were \$9,976,372, and the total disbursements were \$8,478,134, leaving a balance in this fund on Oct. 31, 1908, of \$2,818,216, to which is to be added securities to the value of \$188,700, making the total of the State fund on Oct. 31, 1908, \$3,006,976. The receipts from the State school tax for the fiscal year were \$3,238,558. The school fund had a balance Nov. 1, 1907, of \$146,974, and the receipts for the year were \$303,233, of which \$373,500 was used in the purchase of bonds. The chief receipts for the year were, from State tax on railroad corporations for 1908, \$3,229,924; from State tax on railroad corporations previous to 1908, \$2,645,331; from the federal inheritance tax, \$247,396.

CHARITIES AND CORRECTIONS. The Legislature of 1908 made an appropriation for the year ending Oct. 31, 1909, of \$1,282,525 for charities, \$666,042 for corrections, and \$105,850 for soldiers' homes, an aggregate of \$2,054,469. There are under institutional care in the State, 6408 in charitable institutions; 2646 in criminal institutions, and 733 in soldiers' homes. The Legislature of 1907 passed an act requiring societies and individuals bringing into the State

dependent children or otherwise to obtain the permission of the Superintendent of Charities and Corrections, with whom a bond of \$1000 must be filed that the children shall not become public charges. Several new buildings for the correctional and charitable institutions were erected during the year.

POLITICS AND GOVERNMENT. On Jan. 21, John Franklin Fort, who was elected in 1907, was inaugurated Governor of the State. On Jan. 7, the Court of Errors and Appeals handed down an opinion of great importance, sustaining the constitutionality of the various acts of the Legislature under which the taxes against railroads have been increased by between \$3,000,000 and \$4,000,000 annually. The decisions, with one exception, are a complete victory for the State and the system of railroad taxation provided by the various acts of 1905 and 1906. The attempt to pass a local option law for the State was defeated when the Assembly, on March 17, by a vote of 44 to 15 killed the Crosby bill. The bill had the aggressive support of the Anti-Saloon League of the State. An important measure which became a law was the act passed on April 10, providing for the appointment of a State Civil Service Commission. The bill had the active support of Governor Fort, and it was largely through his efforts that the bill was passed. The Legislature failed to act on the passage of the public utilities bill for the State which had been recommended by a Commission appointed in 1907 to report on such a measure. The first test of the new primary law of the State was held on Sept. 22. Under this law, candidates for office are nominated by direct vote of the people, without the use of conventions. State Senator Everett Colby, the leader of the "New Idea," a party which, in the last few years, has brought about much salutary legislation in the State, was a candidate for reelection, and about him the chief interest in the primaries was centred. He was largely responsible for the enactment of the law and opposed to him were the powerful corporate interests of the State, against whom he had fought for the enactment of regulating laws. In Essex county, which Mr. Colby represented in the Senate, he was given a majority of 7500, in a total vote of about 38,000. In addition to the nomination of Senator Colby, the "New Idea" candidates were largely successful. Five candidates for the Assembly were nominated and the candidate for the shrievalty of the county, the nomination for which had been hotly contested, was successful over his "regular" opponent. A feature of the election throughout the State was the general lack of interest in the local option question. The nominations made were for the State Legislature and for county and municipal officers.

Laxity in the enforcement of the excise law in Atlantic City in August resulted in a proclamation to the people of the State by Governor Fort on Aug. 27, in which he declared that if the excise law was not enforced on the following Sunday, he would call an extra session of the Legislature, and would, if necessary, place the city under martial law. The trouble arose from the refusal of the grand juries to find indictments against alleged offenders against the law. Following the summary action of the Governor, the laws were more rigidly enforced. On Nov. 5, Robert H. McCarter resigned from the office of Attorney-General of the State.

A committee appointed by Governor Fort to investigate the causes of dependency and crime in the State made its report on Dec. 15. The committee of eight was not unanimous in its views, and majority and minority reports were presented. One of the recommendations of the majority was to permit the sale of liquor on Sunday, this being in direct conflict with the views expressed by the excise investigating commission, also appointed by the Governor, which submitted its report on the same date. The commission recommended the abolition of all State boards of managers for institutions and the appointment of a commissioner of charities, who should be a specialist in all phases of the work of such institutions. The minority report dissented from the proposal to sell liquor on Sunday, contending that it should not be permitted under any circumstances.

CONVENTIONS AND ELECTIONS. The Republican State Convention for the selection of delegates to the National Convention, was held at Trenton, on May 5. A strong effort was made to pass a resolution instructing the delegates for W. H. Taft, but this was unsuccessful, and they remained unpledged. On April 28, in one of the most turbulent conventions ever held in the State, the Democrats selected delegates to the National Convention unpledged to any candidate. In the election of Nov. 3, the Republicans carried the State for Taft by 82,776. Aside from the national issues, the chief interest centred about the vote for State Senator Colby (see above). He was defeated for reelection by 684 plurality. Mr. Colby's supporters charged that his defeat was due to a secret coalition between the Republican and Democratic leaders of the county. The detailed vote for national tickets was as follows: Taft, 265,298; Bryan, 182,522; Chafin, 4930; Debs, 10,249; Hisgen, 1916; Gilhaus, 1196.

LEGISLATION. Among important measures enacted by the legislative session of 1908 were those noted below. Stricter laws were enacted against anarchists. It was provided that any person who shall, in public or private, advocate by speech, writing, printing, drawing, or by any other method, the death of any person, or shall threaten to take or procure the taking of the life of any person, shall be guilty of high misdemeanor, and punished by imprisonment at hard labor for a term not exceeding 15 years, or for a fine not exceeding \$5000, or both. It also provides that any person who shall, in any way, advocate, encourage or justify the unlawful burning or the destruction of public or private property, or assaults on the Army of the United States, the National Guard or the police force in New Jersey or any other State, or the killing or injuring any class or body of persons, shall be guilty of high misdemeanor, and that any person or corporation printing or publishing or circulating, or aiding in such act, any printed matter advocating, justifying or tending to incite the unlawful burning or the destruction of public or private property, or any of the acts cited above, shall be guilty of high misdemeanor. Provision was made for the establishment of summer courses in agriculture, manual training, and home economics. A Live Stock Commission for the State was authorized for the purpose of promoting interest in the breeding of pure strains of domestic animals and the improvement of grade animals of the various breeds.

The State Board of Arbitration was abolished. Amendments were made in the laws relating to the hunting of game. A commission was appointed to investigate and report on the condition of the blind in the State and to recommend remedies by which their condition may be ameliorated. Stringent enactments were passed preventing the improper influencing of employees by offers of gratuities. A State Board of Vital Statistics was authorized. Several important measures were passed relating to corporations. An appropriation was made to the State Commission of Tuberculosis of Animals of \$25,000 for the prosecution of its work. Amendments to the Pure Food Law relating to export foreign markets were enacted. The laws relating to elections were amended, especially in regard to the use of voting machines. Two additional inspectors of factories, one a woman, were authorized.

A joint resolution was passed authorizing the government to return the government battle-flags found in the possession of the State. The Legislature authorized the construction of an inland waterway, extending from Cape May to Bay Head, along the coast, and appropriating the sum of \$300,000 for this purpose. A Department of Inland Waterways was established to investigate and report annually to the Governor the routes of the inland waterways of the State, the depth of water therein, the use thereof by traffic of business or pleasure, and to have general conduct of these waterways. Savings banks were authorized to retire on pension officers above the age of 70 years who have been in the employ of the bank continuously for more than thirty years. Measures were enacted forbidding the appearance of children in dance halls or concert saloons in the State. Acts were passed providing for the revision or consolidation of public statutes in the State. Measures were enacted forbidding the sale of cigarettes or cigarette paper or tobacco to minors under the age of 18.

STATE OFFICERS. Governor, John Franklin Fort; Secretary of State, S. D. Dickinson; Treasurer, Daniel S. Voorhees; Comptroller, Henry T. West; Attorney-General, to be named; Adjutant-General, R. H. Breintnall; Superintendent of Education, C. J. Baxter; Commissioner of Banking and Insurance, David O. Watkins—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, W. S. Gummere, Rep.; Justices, Charles W. Parker, Rep.; T. W. Trenchard, Rep.; Alfred Reed, Dem.; C. G. Garrison, Dem.; James J. Bergen, Dem.; Willard P. Voorhees, Rep.; James F. Minturn, Dem.; F. J. Swayze, Rep.; Clerk, William Riker, Jr., Rep.

Court of Errors and Appeals. Judges, J. W. Bogert, George R. Gray, Elmer E. Green, W. H. Vreedenburg, G. D. W. Vroom, Peter V. Voorhees; Chancellor, Wm. J. Magie and the Supreme Court Justices.

The State Legislature of 1908 was composed of 13 Republicans and 8 Democrats in the Senate, 45 Republicans and 15 Democrats in the Assembly. The State representation in Congress will be found in the article UNITED STATES under the section Congress.

NEW MEXICO. A Territory in the Southwestern part of the United States. Its area is 122,634 square miles. Its population in 1908, according to Federal estimate, was 223,332.

MINERAL PRODUCTION. The aggregate value of the mineral products of New Mexico in the year 1907 was \$7,517,843, which was a distinct advance over the value of the product of 1906, which was \$5,805,250. Coal is the most valuable of the mineral products of the Territory. In 1907, there were produced 2,628,949 short tons, valued at \$3,832,128, as compared with 1,964,713 tons, valued at \$2,638,986 in 1906. Copper ranks second in the value of its product, and the amount produced in 1907 shows a very satisfactory increase over that mined in 1906. In the former year there were produced 10,140,140 pounds, valued at \$2,028,028, as compared with 7,099,842 pounds in 1906, with a value of \$1,370,270. The other mineral products of the State are relatively unimportant in value. They include silver, valued at \$395,700 in 1907 and \$329,955 in 1906; stone, with a value of \$381,011 in 1907 and \$168,567 in 1906; clay products, lead, sand and gravel, tungsten, and zinc.

Owing to adverse conditions in the metal market, many copper, lead and zinc mines in New Mexico were closed in 1908, but at those where sufficient gold was found to mine at a profit, operations were not interrupted. The production of gold and silver was probably somewhat smaller in 1908 than in 1907. The Director of the Mint estimates the gold production of the Territory in 1908 as \$240,756, as against \$330,000 in 1907; and the silver production as 372,950 fine ounces, against 599,500 fine ounces in 1907. The coal mining industry in the Territory suffered more from decline in prices in 1908 than it did from the decrease in the tonnage, it being estimated that the values in 1908 would not exceed 75 per cent. of those of the preceding year.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to figures of the United States Department of Agriculture, are as follows: Corn, 1,755,000 bushels, valued at \$1,404,000, from 65,000 acres; spring wheat, 1,025,000 bushels, valued at \$964,000, from 41,000 acres; oats, 804,000 bushels, valued at \$515,000, from 24,000 acres; barley, 42,000 bushels, valued at \$33,000, from 1000 acres; potatoes, 100,000 bushels, valued at \$90,000, from 1000 acres; hay, 336,000 tons, valued at \$3,192,000, from 168,000 acres. The acreage of wheat was slightly less than that of 1907, when it was 46,000. The acreage devoted to hay increased from 160,000 in 1907. The great increase in the agricultural development of the Territory in recent years is due to new irrigated areas. In 1908, about 200,000 acres were made available by new projects. (See IRRIGATION.) The number of sheep in the State is large. In 1908, they numbered 4,978,000. The wool clip was estimated at 16,500,000 pounds, New Mexico ranking fourth in its production.

MANUFACTURES. The total value of products manufactured in factories in 1905 was only \$5,705,880, but this was 40.5 per cent. greater than the similar value for 1900. The wage-earners in 1905 numbered 3478, or 39.7 per cent. more than in 1900. The values of leading industries in 1905 were: Railway shop work, \$2,509,800, and lumber and timber products, \$1,315,300. There are also some flour milling and printing and publishing plants and a few planing mills.

EDUCATION. The progress of education is greatly hampered by the sparseness of popula-

tion and the presence of two languages in general use. The approximate school population (ages 5 to 21), as given in the Governor's 1907 report, was 80,000, and the total enrollment was about 50,000. There were also several thousand enrolled in parochial and mission schools. There were employed a total of about 1000 teachers. The average length of school term in 1907-8 was 123 days. The estimated value of public school property was \$1,000,000, and the bonded indebtedness of public schools was \$533,911. The total expenditure for schools in 1907-8 was \$539,964.

FINANCE. The treasury held a balance of \$345,125 on June 1, 1907. The receipts for the fiscal year following were \$754,800, and the expenditures \$721,272, leaving a balance on June 1, 1908, of \$378,653. The principal source of revenue was the property tax. The Territorial debt, July 1, 1908, amounted to \$1,003,000, as compared with \$803,000 in 1907. The sinking fund held assets valued at \$64,989. The assessed valuation in 1908 was \$52,587,649.

POLITICS AND GOVERNMENT. There was no meeting of the Territorial Legislature in 1908. On Mar. 21, the Republican party of the Territory met in convention and instructed the delegates chosen to vote for W. H. Taft for president, and on June 10, the Democratic party took similar action on behalf of W. J. Bryan. The result of the election of Nov. 3, for delegate to Congress, was as follows: Andrews (Rep.), 27,605; Larrazolo (Dem.), 27,217; Metcalf (Soc.), 1056.

OTHER EVENTS. The Sacramento Valley Irrigation Co., which was constructing one of the largest irrigation systems in the Southwest, was placed in the hands of a receiver on Jan. 5. Several important irrigation projects were begun during the year. See **IRRIGATION**.

TERRITORIAL OFFICERS. Governor, George Curry, Rep.; Lieut.-Governor and Secretary of State, Nathan Jaffa, Rep.; Treasurer, J. H. Vaughn, Rep.; Auditor, W. G. Sargent, Rep.; Adjutant-General, A. J. Tarkington, Rep.; Attorney-General, James M. Hervey, Rep.; Supt. Education, J. E. Clark, Rep.; Com. of Insurance, Jacobo Chavez, Rep.; Com. of Agriculture, Robert P. Ervien.

JUDICIARY. Supreme Court: Chief Justice, William J. Mills; Associate Justices, John R. McFie, Ira A. Abbott, W. H. Hope, E. A. Mann, and F. W. Parker; Clerk, José D. Sena—all Republicans.

The Territorial Legislature of 1908 was composed of 9 Republicans and 3 Democrats in the Senate, 20 Republicans and 4 Democrats in the House. The Territorial representation in Congress will be found in the article **UNITED STATES**, under section *Congress*.

NEW ORLEANS ANT. See **ENTOMOLOGY**.

NEW SOUTH WALES. A State of the Australian Commonwealth. Area, 310,372 square miles; population at the end of 1906, 1,526,697. Sydney, the capital, had 538,800 inhabitants on the same date. For details regarding population, education, production, etc., see **AUSTRALIA**. The executive power is vested in a Governor, appointed by the Crown and acting through a responsible ministry. The Parliament consists of a legislative council, the members of which are appointed by the Governor for life, and number at present 56; and a legislative assembly of 90 members, elected for three years by universal suffrage, without distinction of sex. The present

Governor is Admiral Sir Harry Holdsworth Rawson, and the Premier, Charles Gregory Wade.

HISTORY. At a conference of the Labor party in January resolutions for the collective ownership of the means of production, distribution and exchange were rejected by a majority of 118 to 27. A special session of Parliament was opened by the Governor, Sir Harry Rawson, on Mar. 10, to act on the amendment of the Arbitration Act and to make some forfeited improvement leases available for settlement. For an account of the dissatisfaction caused by the working of the Arbitration Act, see **ARBITRATION AND CONCILIATION; LABOR**. The proposed changes were embodied in an Industrial Disputes Bill, which provided for the appointment for two years of a board for each industry, representing equally employers and employees, and having a membership not to exceed eleven, including the chairman. The boards should determine the rate of wages, hours of labor, overtime, etc., and their awards should be binding on both parties for periods of from one to three years. The bill was subsequently amended to provide a court of appeals from the decision of these wages boards and to declare specifically that the boards should decide the question of according preference to union labor. Among other measures proposed by the government later in the year were the acquisition of large areas for closer settlement and an amendment of the Crown lands law, prohibiting the conversion of leaseholds into freeholds. A strike of coal laborers occurred at Newcastle and Sydney, the main point being the question of employing free labor. The companies agreed to increase wages but not to dismiss non-union men or employ only unionists, and public opinion seemed to be on their side, favoring a compromise.

NEW YORK. One of the North Atlantic Division of the United States. Its area is 49,204 square miles. Its population, according to Federal estimates made in 1908, was 8,546,356.

MINERAL PRODUCTION. The total value of the mineral output of the State in 1907 was \$37,427,405, showing a small advance over the total for 1906, which was \$37,132,832, the largest recorded up to that time. The growth of the mineral industry in the State may be shown by the fact that in 1905 the figures of production were \$35,470,987 and in 1904 they were only \$28,812,595. Iron mining in the State has undergone an uninterrupted expansion during the past four years. The output for 1907 amounted to 1,018,013 long tons and exceeded that of any previous year since 1890. There were thirteen mines under exploitation or two more than in 1906 when the production was 905,367 tons. With the return of the iron market to normal conditions, it may be expected that the iron ore condition of New York will develop beyond all proportions of the past. The clay materials reported in 1907 represented an aggregate value of \$12,688,868. There was a decrease of \$1,266,432 from the amount returned for the preceding year, due to the smaller output in market values of building materials. The combined output of brick, tile, fireproofing, and terra cotta used for building purposes was valued at \$8,909,392 as compared with \$11,063,433 in 1906. The number of bricks made was 1,366,842,000. The decline in the output of building materials was counterbalanced in some degree by the gain in pottery manufactures,

which were valued at \$2,240,895 against a value of \$1,795,008 for the preceding year. Of the 61 counties of the State 43 were represented among the reports received in 1907 from the manufacturers of clay products. The value of the products of the quarries of New York in 1907 was \$7,890,327 against \$6,504,165 in 1906. The total was divided according to the various uses into building stone, \$2,208,545; monumental stone, \$162,359; curb and flag stone, \$1,064,193; crushed stone, \$2,812,988; other uses, \$1,642,232. The output of slate, millstone and limestone used in making hydraulic cement, is not included in these totals. The output of hydraulic cement in 1907 was 3,245,729 barrels, with a value of \$2,971,820. The salt production of the State for 1907 amounted to 9,657,543 barrels as compared with 9,013,993 barrels in 1906, thus continuing the progress that has been for some time a feature of this industry. The value of the output was \$2,449,178, exceeding that of 1906 by \$317,528. Other mineral products of importance in 1907 were gypsum, 323,323 short tons; petroleum, estimated at 1,052,324 barrels; natural gas, 3,052,145,000 cubic feet; pyrite, 49,978 long tons; talc, 59,000 short tons; garnet, 5,709 short tons; crystalline graphite, 2,950,000 pounds.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 24,350,000 bushels, valued at \$19,400,000 from 625,000 acres; winter wheat, 7,752,000 bushels, valued at \$7,674,000 from 443,000 acres; oats, 637,625,000 bushels, valued at \$21,070,000 from 1,250,000 acres; barley, 2,002,000 bushels, valued at \$1,401,000 from 77,000 acres; rye, 2,392,000 bushels, valued at \$2,938,000 from 145,000 acres; buckwheat, 6,827,000 bushels, valued at \$5,189,000 from 319,000 acres; potatoes, 34,850,000 bushels, valued at \$26,138,000 from 425,000 acres; hay, 5,717,000 tons, valued at \$70,033,000 from 4,764,000 acres; tobacco, 7,257,975 pounds, valued at \$689,508 from 6,107 acres. The State ranks first in the production of potatoes, hay, and buckwheat, and fourth in the production of rye. The potato crop decreased in 1908 from 41,748,000 bushels in 1907. The hay crop also suffered a slight decrease, the production in 1907 being 5,896,000 tons. The production of buckwheat increased in 1908 over the figures of 1907, which were 5,687,000 bushels. The number of farm animals in the State Jan. 1, 1909, was as follows: Horses, 710,000; dairy cows, 1,789,000; other cattle, 898,000; sheep, 1,165,000; swine, 669,000. The wool clip in 1907 was estimated at 5,100,000 pounds, valued at \$1,158,500.

MANUFACTURES: New York is by far the greatest manufacturing State in the Union. The Federal census of 1905, which included only establishments classed as factories, reported \$2,031,459,000 capital, 856,947 wage-earners, and \$2,488,345,000 in value of products, these figures showing increases, 1900 to 1905, of 33.3, 17.9, and 32.9 per cent., respectively. The wage-earners included 245,449 women and 7979 children under 16. The number of children was only three-fifths as large as in 1900. The value of products of leading industries in 1905 and (in parentheses) the per cent. of increase from 1900 to 1905 were as follows: Men's clothing, \$173,548,000 (32.2); women's clothing, \$167,-

167,000 (62.4); sugar and molasses refining, \$116,439,000 (28.4); foundry and machine shop products, \$115,876,000 (19.9); newspapers and periodicals, \$85,756,740 (36.2); slaughtering, \$73,218,000 (27.5); malt liquors, \$61,958,000 (10.4); bakery products, \$61,033,000 (41.8); cigars and cigarettes, \$60,623,600 (23.7); flour and grist mill products, \$54,546,000 (51.6); book and job printing, \$50,061,000 (59.4); hosiery and knit goods, \$46,108,600 (28.5); planing mill products, \$4,779,600 (37); paper and wood pulp, \$37,750,600 (41.3); electrical machinery and apparatus, \$35,348,000 (55); illuminating gas, \$35,315,000 (68.8); boots and shoes, \$34,137,000 (33.4); millinery and lace goods, \$32,844,000 (56); cheese, butter, and condensed milk, \$31,047,700 (16.9); iron and steel, \$29,862,000 (115); men's furnishing goods, \$29,337,000 (slight increase); chemicals, \$29,090,000 (81.9); furniture, \$28,110,700 (18.9); roasting and grinding coffee and spices, \$26,995,000 (20); fur goods, \$26,244,000 (65.8); musical instruments, \$23,389,500 (58.6); leather, \$21,643,000 (6.7 per cent. decrease); tinsmithing, copper-smithing, and sheet iron working, \$20,960,000 (52.9); shirts, \$20,241,600 (9.5 per cent. decrease), and silk and silk goods, \$20,181,000 (58.8). Ten different branches of textiles were reported among the 61 leading industries, with products valued at \$123,668,000, or 31.3 per cent. more than the value in 1900. In addition to the foregoing the following industries showed products valued at more than \$15,000,000 in 1905: Structural iron work, carpets and rugs, paints, confectionery, railway repair shops, and patent medicines and compounds, and the following exceeded \$10,000,000 in value: Soap and candles, marble and stone work, cotton goods, lumber and timber products, agricultural implements, fancy and paper boxes, carriages and wagons, lithographing and engraving, jewelry, canning fruits and vegetables, food preparations, and bookbinding and blank book making. The values for petroleum refining, copper smelting and refining, and the manufacture of locomotives were not reported, in order to avoid disclosure of individual operations. The rank of leading cities is shown by their respective values of products in 1905: New York, Manhattan and Bronx boroughs, \$1,043,252,000; Brooklyn, \$373,463,000; other boroughs, \$109,808,000; Buffalo, \$147,377,800; Rochester, \$82,747,000; Syracuse, \$34,823,700; Yonkers, \$33,548,700; Schenectady, \$33,084,000; Troy, \$31,860,800; Utica, \$22,880,000, and Albany, \$20,208,700.

EDUCATION. The report of the State Commissioner of Education for the fiscal year ending June 30, 1908, shows a total expenditure for education from June 30, 1907, to June 30, 1908, of \$73,151,114. For elementary education there was expended \$48,464,769, an increase of \$1,387,049 over the expenditure of 1907. For teachers' salaries was expended \$27,059,038; for building sites, etc., \$13,119,838; for school apparatus, \$128,644; for school libraries, \$169,823. There were registered in the State, 1,272,495 between the ages of 5 and 18, an increase of 14,478 over the registration of 1907. The average daily attendance was 995,916, or 78.3 per cent. of the enrollment, an increase of 1.2 per cent. There were employed 38,404 teachers, of whom 3,443 were men and 34,961 women. The average annual salary was \$748.89, a decrease of \$7.21. The value of school buildings, including sites, was \$167,456,592, an

excess of more than \$15,000,000 beyond any previous record, and \$14,230,214 was expended for new buildings, improvement, etc. Twenty-three cities maintain evening schools, which were attended by 133,781 pupils, of whom 82,277 were males and 51,504 were females.

The total amount expended for secondary schools during the year was \$9,142,938, of which \$6,971,985 was for high schools and \$2,170,953 was for private academies. There were 681 high schools of two grades and 159 academies. The whole number of academic students was 107,419, including 95,170 in high schools, 7,563 in academies and 4,686 in the preparatory departments of colleges. The total number of teachers in the secondary schools was 4,994, of whom 1,823 were men and 3,175 were women. 57 per cent. of the money expended for their tuition was paid to schools and colleges of less than 2,000 inhabitants, showing that the State is rapidly placing the high school within the reach of every farm or rural home. A division has been established to promote the organization of trade schools, or public trade or vocational schools, and plans have been prepared for opening such schools in five cities. One such school was opened in Rochester, and another was to open in the same place on Feb. 1, 1909, and another in Albany on March 1, 1909. A number of others will open at the beginning of the next school year.

There were in the colleges, universities, professional and technical schools of the State, 37,659 students, an increase of 1,091. The teaching force was 4,276, as against 3,996 in 1907. There were conferred 4,037 degrees, 3,008 to men and 1,029 to women. The property value of these institutions is reported at \$121,927,406. The receipts for their maintenance was \$13,848,681, a decrease of \$2,459,028 over the figures for 1907.

FINANCE. The report of the State Treasurer for the fiscal year 1908 showed the total aggregate receipts for the year, \$59,049,595. The aggregate expenditures were \$48,036,091. On Oct. 1, 1907, there was a balance in the treasury of \$20,771,571, leaving a balance Oct. 1, 1908, of \$31,785,076. Of the revenue, \$6,605,480 was received from inheritance tax; \$8,937,635 from corporation taxes; \$9,359,330 from excise taxes; \$3,907,373 from stock transfer tax. Of the disbursements \$6,079,122 were for education; \$5,919,434 for the State care of the insane hospitals; \$2,216,842 for hospitals and charitable institutions; \$6,501,431 for public highways; the total payments for canals was \$7,236,348.

CHARITIES AND CORRECTIONS. There are fourteen charitable institutions subject to the visitation and inspection of the State Board of Charities. These are: State Agricultural and Industrial School at Industry; Syracuse State Institution for Feeble-Minded Children, Syracuse; New York State School for the Blind, Batavia; Thomas Indian School, Iroquois; State Custodial Asylum for Feeble-Minded Women, Newark; New York State Soldiers' and Sailors' Home, Bath; New York State Training School for Girls, Hudson; Western House of Refuge, Albion; New York State Reformatory for Women, Bedford; Rome State Custodial Asylum, Rome; Craig Colony for Epileptics, Sonyea; New York State Woman's Relief Corps Home, Oxford; New York State Hospital for the care of Crippled and Deformed Children, West Haverstraw; New York State Hospital for the Treatment of Incipient Pulmonary Tuberculosis, Ray-

brook. The receipts for these institutions for the fiscal year ending Sept. 30, 1908, including balance on hand at the beginning of the year amounted to \$1,854,492, and their expenditures aggregated \$1,786,878. The total number of their beneficiaries was 10,601. In addition to the fourteen State charitable institutions above mentioned, two or more are established but not yet in operation. These are the New York Training School for Boys and the Eastern New York State Custodial Asylum. In addition to these State institutions there are ten schools and institutions under private management, but mainly supported by State appropriations. Receipts for these institutions for the fiscal year were \$1,571,689 and their expenditures aggregated \$1,402,538. The total number of their beneficiaries was 3,332. The number of persons in institutions receiving public money, subject to the visitation and inspection of the State Board of Charities, was 75,847 on Sept. 30, 1908. During the year 57,592 persons received temporary outdoor relief in the cities of the State and for this purpose \$395,438 was expended. See CHARITY ORGANIZATION.

The Psychiatric Institute of the State Hospitals for the Insane is situated on Wards Island, in connection with Manhattan State Hospital, and is under the Directorship of Adolf Meyer. The number of insane inmates in the various hospitals at the close of the fiscal year, Sept. 30, 1908, was as follows: Utica, 1269; Willard, 2327; Hudson River, 2759; Middletown, 1766; Buffalo, 1929; Binghamton, 2087; St. Lawrence, 1858; Rochester, 1345; Gowanda, 996; Kings Park, 3139; Long Island, 737; Manhattan, 4491; Central Islip, 3645; Matteawan, 733; Dannemora, 340. Total, 29,421. There were also 1,035 patients in the private hospitals licensed by the Commission in Lunacy, making a grand total of 30,456 patients. The total expenditure for maintenance was as follows: Officers' salaries, \$258,296; employees' wages, \$1,741,828; provisions and stores, \$1,654,652; ordinary repairs, \$83,487; farms and grounds, including live stock, \$110,031; clothing, \$163,775; furniture and bedding, \$116,775; books and stationery, \$25,507; fuel and light, \$604,743; medical supplies, \$32,260; miscellaneous, \$137,897; transportation of patients, \$25,490; making a total of \$4,953,635. The receipts from partly or fully reimbursing patients amounted to \$350,713. The Commissioners are Albert Warren Ferris, M. D., Sheldon T. Viele, and William L. Parkhurst.

POLITICS AND GOVERNMENT. The most notable event in the local political history of the State was the passage on June 10 of the laws prohibiting gambling at race tracks in the State. The struggle for the passage of this bill began, in active form, on Jan. 1, when Governor Hughes in his message to the Legislature urged the enactment of such measures. Gambling was carried on at the race tracks under the so-called Percy-Gray law which, while it ostensibly forbade betting on horses, made such betting only a misdemeanor, with a penalty so inadequate that the law was seldom invoked, and gambling at race tracks was practically unrestrained, though it was forbidden under heavy penalties in any other place. The amendment of this law was demanded by Governor Hughes in the interest of public morality. The racing interests had great strength politically and financially in the State,

and this was brought to bear against the amendment of the law. Opposed to the Governor, too, were nearly all the Democratic legislators, together with a strong element in his own party who, from various motives, were not in favor of the anti-gambling laws. The measures were not strongly opposed in the Assembly, where they passed by a substantial majority. The chief struggle came in the Senate. There, where there was a vacancy caused by the sickness, and subsequent death, of Senator Franchot (Rep.) of the Niagara Falls district, the vote was a tie, when the bill was called up on April 8. Two Democrats voted for it and eight Republicans against it. The vote was 25 to 25. This result did not kill the bill, but placed it in a position where it might be called up again whenever a majority could be secured for such action. Such a condition was impossible, and the session adjourned on April 23, without further action.

Immediately after the adjournment, Governor Hughes issued a call for an extraordinary session of the Legislature to convene on May 11. In his message, at the convening of this session, Governor Hughes made no reference to the race track, except to promise a later message in relation to it. On May 12, an election was held in the district composed of Orleans and Niagara counties to fill the vacancy in the Senate caused by Senator Franchot's death. William C. Wallace, who had pledged himself to vote for the bills in case of his election, was successful by a small majority over his Democratic competitor. On June 8, Governor Hughes transmitted to the Legislature a special message in which he again urged the passage of the bill. The scene in the Senate when the bill came up for action on June 10 was one of the most dramatic in the legislative history of the State. It was known before the voting that the defeat or passage of the measures depended on the absence or presence of one man, Senator Foelker (Rep.) of Brooklyn, who had voted for the bill at the regular session, but was seriously ill when the extra session was called. He was known to be still in favor of the bill. Acting against the advice of his physicians he insisted on being present, and his vote was the decisive one in the passage of the bill. The final vote taken on June 11 was 26 to 25. It is significant of the public sentiment in favor of these measures that the eight Republicans who voted against it were, almost without exception, defeated for reelection by their constituents, while Senator Foelker was elected to the House of Representatives on Nov. 3.

This victory of Governor Hughes, in the face of extraordinary opposition, gave him a strong hold on the Republican party of the State, and made him an important national figure. It did not, however, win for him popularity with the political leaders of his party in the State, who resented his aggressive independence, and his total disregard of their wishes in distributing the patronage of the State.

Governor Hughes was not so successful in his attempts to have Otto Kelsey removed from the office of Superintendent of Insurance. This was one of the first things he undertook to accomplish at the beginning of his term in 1907. The Senate, however, refused to accede to his wishes to remove Kelsey from office. On February 11, 1908, Governor Hughes sent a message to the Sen-

ate calling for Kelsey's removal, but that body, on Feb. 26, by a vote of 30 to 19, again refused to take such action.

In February the State Court of Appeals handed down an important opinion upholding the constitutionality of the Public Service Commissions law, passed in 1907. The act, however, was condemned as to that part which provides for a readjustment in three years in not giving to the companies an equal right with the consumers to complain. The court held that a statute like the one considered, to be valid, should confer equal rights on both parties, the consumer and the company. In the case at issue the Saratoga Gas Co. questioned the validity of the act.

On Mar. 6 the Court of Appeals decided that ballot boxes in the disputed mayoralty election of 1905 in New York City might be opened. Governor Hughes, on May 7, approved the revision of the State Military code so as to conform the organization of the National Guard to that of the regular army. The constitutionality of the apportionment act, passed by the Legislature in extraordinary session in 1907, by which new Senate districts were created, was sustained by Justice Fitts of the Supreme Court on July 31. The judge held that when the Court of Appeals nullified the apportionment act of 1906, it became mandatory upon the Legislature of 1907 to pass an act in its place, and it was immaterial whether the act was passed at a regular or an adjourned session.

A commission was appointed by Governor Hughes in December to investigate and make reports upon the operation of the Stock and other Exchanges, and the general subject of speculation in stocks. The commission is composed of well-known business men and economists.

On Dec. 21 the Supreme Court of the United States affirmed the validity of the New York Mortgage Law, thus affirming the judgment of the Supreme Court of the State.

On Dec. 2, Governor Hughes approved the revised classification of places in the State and county service, with a few exceptions. This action removes from political patronage many of the most profitable offices in the State. Among the departments affected are the Executive Department, Insurance Department, Prison Department, Excise Department, State Public Works Department, New York State Public Service Commission, Up-State Public Service Commission, Forest, Fish and Game Commission, and the State Fair Commission.

NEW YORK CITY. A commission to revise the charter of the city was appointed by Governor Hughes on April 21. This body has the power of a legislative committee to inquire into the operations of the various city governments, and to draw up a revised charter to submit to the Legislature of 1909. Investigations were carried on during the year. On Feb. 27, W. F. King and a committee of the minority stockholders of the Metropolitan Street Railway Company petitioned Governor Hughes to remove District Attorney William T. Jerome for dereliction of duty in failing to prosecute cases in which the railway company was involved and for other reasons. Mr. Jerome, on Mar. 9, filed with Governor Hughes an answer to these charges, in which he denied them categorically, and accused the petitioners of mendacity and insincerity. On Mar. 16, Governor Hughes ap-

pointed Charles Andrews, formerly a judge of the Court of Appeals, to conduct a hearing on the charges made. After several weeks, Judge Andrews was unable to proceed on account of other duties, and Richard L. Hand was appointed in his place. The investigation continued for many weeks, and voluminous testimony was taken on both sides. On Aug. 24, Mr. Hand sent to Governor Hughes a report, in which Mr. Jerome was completely exonerated, and his accusers were severely criticised.

As a result of the decision of the Court of Appeals noted in the paragraph above, a recount of the ballots cast in the mayoralty election of 1905 was begun on April 13. In that election the contestants were George B. McClellan and William R. Hearst. Mr. McClellan was elected by a majority of less than 3,000 votes, in a total vote for both of nearly 450,000. Mr. Hearst claimed gross frauds, and he, through the courts, fought for a recount through the years following. The result of the recount, which occupied months, was that Hearst received gains of 1,094 votes, and McClellan gains of 231, leaving net gains for Hearst of 863. The jury, by the direction of Judge Lambert of the Supreme Court, declared Hearst's charges unfounded, and that McClellan was elected by a plurality of 2,791 votes.

Investigations were carried on during the year various city departments by the Commissioners of Accounts, as the result of evidence prepared by the Bureau of Municipal Research. The conduct in office of the presidents of two boroughs, Haffen of the Bronx and Bermel of Queens, was assailed. Charges against both for misconduct were sent to Governor Hughes by Mayor McClellan. Mr. Bermel resigned before the charges could be passed upon and Lawrence Gresser was chosen to succeed him, at a special election. The charges against Mr. Haffen had not been acted upon by Governor Hughes at the close of the year. A state of demoralization and corruption was found in the City License Bureau, which has charge of the issuing of licenses to peddlers, and for musical and other performances. The head of the Bureau was suspended from office, pending investigation. The surface railroads of the city continued to remain in the hands of receivers during the year. The Third Avenue road, which had been held jointly by the receivers of the New York City and the Metropolitan Street Railway Companies, was given a separate receiver by the United States Circuit Court. A very general suspension of transfer privileges on the part of the receivers of the various roads caused much inconvenience and dissatisfaction to those who used the lines. The efforts of the Public Service Commission to establish a system of transfers met with no success. The Hudson River tunnels from the shopping district of New York to New Jersey were finally opened for traffic on Feb. 25, and the great terminal buildings downtown were completed in readiness for the opening of the tunnels to that point. The tunnels constructed by the Pennsylvania Railroad across the North River were dug through on April 10, making it possible to walk underground from Long Island City to New Jersey. The bridge from Manhattan to Long Island City, across Blackwell's Island, known officially as the Queensboro Bridge, was practically completed and substantial pro-

gress was made in the construction of the new Manhattan Bridge. See BRIDGES.

The city budget for 1909 contained amounts aggregating \$156,000,000, as against \$143,000,000 in 1908. In connection with this there was held, under the auspices of the Bureau of Municipal Research, a Budget Exhibit, where was shown many instances in which, by laxity or corruption, the city was defrauded. The Knickerbocker Trust Co., whose suspension in October, 1907, precipitated the panic of that year, reopened for business in March. Charles W. Morse, who was one of the chief figures in the financial crisis of 1907, was convicted in the Federal Court on Nov. 6 of misapplying the funds of the Bank of North America, of which he was a director, and was sentenced to 15 years' imprisonment. A. H. Curtis, former president of the bank, was also found guilty, but his sentence was suspended by the court. On Mar. 28 a body of unemployed attempted to hold a meeting in Union Square. They were prevented by the police, and an avowed anarchist, named Selig Silverstein, exploded a bomb, which killed a man sitting beside him and terribly injured himself. He afterwards died of his injuries.

On Jan. 11, fire caused a loss amounting to \$6,000,000, and on Nov. 1, another fire destroyed property valued at \$2,500,000. A system of high-pressure water supply, installed during the year, promises to give much more efficient control of fires than the old system. See FIRE PROTECTION. At a city bond sale held in February, the offering of \$500,000,000 4½ per cent. bonds was over-subscribed six times, and the average price bid was 104, as compared with 102 bid in the sale of September, 1907. Several new subway routes were planned and authorized by the Public Service Commission, but the condition of the city's finances did not permit of any expenditures for the beginning of new routes. One of the routes projected is a short one across town, but the other extends from the Battery to Pelham Bay Park.

CONVENTIONS AND ELECTIONS. The announcement by Governor Hughes on Jan. 21, that he was a candidate for the Presidency, complicated the Republican politics of the State. With the party leaders, as noted above, he was not popular, and the sentiment was against him in the party councils. His strong position in the State, and the prominence he had attained as a national figure, made it impossible for the leaders to ignore him, and his candidacy was endorsed by the Republican State Committee on March 7. At the State Convention to choose delegates to the National Convention, held on April 11, the delegates selected were instructed to vote for Governor Hughes for President. The Democratic State Convention to choose national delegates was marked by a bitter contest between the Tammany organization, led by Charles F. Murphy, and the Kings County Democracy, the organization of Brooklyn, under the leadership of State Senator P. H. McCarran, over the seating of the delegates from Brooklyn, who were hostile to Tammany Hall. By a vote of 325 to 89 it was decided that the delegation should not be seated. This was another incident in the bitter struggle that was waged for years over the control of the Brooklyn Democracy, which has, so far, remained independent of Tammany Hall. The delegates to the National Convention were uninstructed,

though strong efforts were made to have instructions given for Mr. Bryan.

It was generally considered that Governor Hughes did not wish to serve another term as Governor, and his announcement, made on July 24, that he would be a candidate for a second term came as a surprise. The attitude of the State leaders indicated their feeling for Mr. Hughes and his policies. They were, almost without exception, non-committal, when they were not frankly outspoken against him. Beyond his formal announcement, Governor Hughes himself did nothing to further his chances for renomination. Public sentiment, however, manifested itself so strongly in favor of him in all sections of the State that at the State Convention held at Saratoga on Sept. 15, he was renominated by an overwhelming majority on the first ballot. On the day following the Democrats in State Convention nominated Lewis S. Chanler, the Lieutenant-Governor, for Governor. The campaign was one of the most spirited in the history of the State. Mr. Chanler, personally, was a strong candidate, and made an aggressive canvass. Governor Hughes was in such demand in the national campaign that, until the first part of October, he could devote but little time to the State issues. In the final weeks, however, he visited every section of the State, delivering speeches of great strength and conviction. His success seemed dubious, even to his most ardent supporters, in the face of the powerful factions against him, and the result of the election of Nov. 3 was as surprising to his adherents as to those who opposed him. The State was carried for Mr. Taft by a plurality of over 200,000. The City of New York, where is the chief Democratic strength of the State, was won by the Republicans by a small plurality. Governor Hughes carried the State by a plurality of about 70,000, though New York City was carried by Chanler by about 60,000. The detailed vote for national and State tickets was as follows: Taft, 870,070; Bryan, 667,468; Debs, 38,451; Hisgen, 35,817; Gillhaus, 3,877. Hughes, 804,651; Chanler, 735,189; Shearn (Ind.), 33,994; Wauhope (Soc.), 43,212.

LEGISLATION. The regular legislative session of 1908 differed from that of 1907 in that it did not enact a single important measure recommended by Governor Hughes. Among the measures passed were the following: A three-platoon police bill, applying to cities of the first and second class; measures amending the banking laws of the State (see **BANKS AND BANKING**); a bill prohibiting the operation of bucket shops in the State; a bill providing for an investigation of the financial condition of the New York City government; amendments to the excise law, making the laws more stringent; a bill providing for the appointment of a commission to inquire into the condition of aliens landing at New York City, and to advise means to aid them; an act authorizing an appropriation of \$250,000 from the race track receipts for the agricultural societies to conduct their fairs; an act authorizing New York City to acquire lands to carry into effect a sewage disposal system; a measure providing for the registration of cases of tuberculosis in the State. The Hart-Agnew anti-racing bills, whose passage is noted above, were enacted at the special session convened on May 11.

STATE OFFICERS. Governor, Charles E. Hughes; Lieutenant-Governor, Horace White;

Secretary to the Governor, Robert H. Fuller; Secretary of State, Samuel S. Koenig; Comptroller, Charles H. Gaus; State Treasurer, Thomas B. Dunn; Attorney-General, Edward R. O'Malley; State Engineer and Surveyor, Frank M. Williams; Commissioner of Education, Andrew S. Draper; Superintendent of Insurance, William H. Hotchkiss; Superintendent of Banking Department, Clark Williams; Superintendent of State Prisons, Cornelius V. Collins; Superintendent of Public Works, Frederick C. Stevens; President, State Commission in Lunacy, Albert Warren Ferris; Public Service Commission, Chairman First Division, William R. Willcox; Chairman Second Division, Frank W. Stevens.

NEW YORK ACADEMY OF SCIENCE.

An Association incorporated in 1818 as the Lyceum of Natural History in the City of New York, which was exchanged in 1876 for the present name. In 1902 the Academy was empowered by legislative enactment to obtain funds and erect a building for scientific uses. The Academy held its annual meeting Dec. 21, 1908. It has in its keeping the Esther Hermann Building Fund and the John Strong Newberry Fund for the encouragement of scientific research. The Academy's Library, which is domiciled at the Museum of Natural History, is free to the public. The Academy has 450 active members. The President in 1908 was Charles F. Cox; Recording Secretary, E. Otis Hovey; Corresponding Secretary, Henry E. Crampton.

NEW YORK, COLLEGE OF THE CITY OF. An institution of higher learning in New York City, founded in 1847. The attendance in 1908 was 4383, about one-eighth of whom were of the collegiate grade. The library contains 39,000 volumes. The college is a part of the educational system of New York City and is supported by appropriations from the city. On May 14th the new buildings of the university on Washington Heights were dedicated with imposing ceremonies. These buildings were constructed for the college by the city. The President is John H. Finley.

NEW YORK PUBLIC LIBRARY. A public institution founded in 1895 by the consolidation of the Astor Library, the Lenox Library, and the Tilden Trust. The library includes, besides the Astor and Lenox library buildings, 41 branch libraries throughout the city. These compose the circulating department of the New York Public Library. During 1908, 289,546 visitors and readers visited the reference branches (Astor and Lenox). There were received during the year 29,337 volumes and 65,679 pamphlets. The total number available for readers was 758,918 volumes and 283,075 pamphlets, a total of 1,041,993 pieces in the reference department. In the branches were 680,244 volumes, making a total number of pieces in the whole library, 1,722,237. From the fund of \$5,200,000 given in 1901 by Andrew Carnegie for that purpose, 28 branches have been constructed. In 1908 work was carried on for the building of three more. The circulation for the calendar year was 6,504,402, an increase of 1,014,158 over the calendar year 1907. Among the special features of the library are travelling libraries, maintained for schools, for police and fire departments, for charitable institutions and for the blind. A training class for the preparation of librarians is also conducted. Special

children's libraries are maintained in most of the branches. The construction of the new library building at Fifth Avenue and 42d Street, which was begun in 1902, had progressed in 1908 to such an extent that the exterior was practically completed and the completion of the interior was well under way. It was expected that the building would be ready for occupancy in 1911.

NEW YORK UNIVERSITY. An institution of higher learning in New York City, founded 1830. The enrollment for 1908-1909 is as follows: Arts 509, Law 770, Commerce 882, Medicine 461, Pedagogy 608, Graduate 282, Applied Science 223, Summer School 626, Woman's Law Class 46; total, excluding names counted twice, 4118. Of the above number 1000 have been instructed at University Heights, 461 at the Medical Buildings, First Avenue between 25th and 26th Streets, and the remainder in the University Building at Washington Square, where was the original site of the University. In the year 1908 for the first time in a score of years the ordinary sources of revenue fully met the ordinary expenses of the University, including under ordinary revenue the stated subscriptions for current support but not including any legacy or gifts for permanent property. After conference with various representatives of the alumni of the University Schools, the corporation has accepted a plan for securing alumni participation in the choice of its members. The plan establishes an Alumni Electorate in four groups numbering respectively about 12,000; 2,000; 10,000; 1,600. Every alumnus may qualify in the group to which he belongs by an annual payment of \$2. Any alumnus who gives the University \$100 in one payment becomes a life member. Each group may have a member of the Council for each fifth of its members who qualify up to four-fifths; thus it will be possible for the four groups to nominate sixteen members, or one-half of the entire corporation. Final vote on the plan was to be taken by the corporation in February. The tuition receipts for the year 1907-8 were over \$300,000. The chancellor is H. M. McCracken.

NEW YORK ZOÖLOGICAL SOCIETY. A private scientific society, having for its purpose the establishment of a zoölogical park and the preservation of American animals. On Mar. 24, 1907, the Society entered into a contract with the City of New York to establish and maintain a zoölogical park in a portion of the south end of Bronx Park, consisting of 261 acres of land, comprising open glades, forest lands and lakes, which now constitutes the New York Zoölogical Park. The Park in area and in the elaboration of its buildings is the largest and most highly developed park in the world. The collections belong to it and are supplied by the New York Zoölogical Society and comprised, on Aug. 1, 1908, 5,078 specimens, the largest number of any collection of the world, and includes 996 species, being the fourth largest in the world. The attendance in 1908 was nearly 1,500,000. The Society completed during the year a new elephant house, costing, with its yards, nearly \$200,000, and forming the most complete and elaborate animal building in the world. A fine collection of elephants and rhinoceroses has been installed in this building. The Society also manages and controls the New York

Aquarium, and through its efforts has built up the largest and most complete aquarium in the world. It is the only institution of its kind that attempts to maintain in the temperate zone tropical collections by means of heated sea water, which is brought in from the open ocean at great expense and filtered, aerated and heated in a large receiving tank. The attendance at the Aquarium during the year 1908 was over 2,000,000. The Society has taken an active part in the protection of American animals. In the interest of the preservation of the American bison, a herd of 15 bison was presented to the government and, through the efforts of the Society, established in the Wichita Forest Reserve in Oklahoma in 1908.

NEW ZEALAND. A British colony in the South Pacific, consisting of North Island (44,468 square miles), South Island (58,525 square miles), Stewart Island (665 square miles), and the Chatham, Cook, Kermadec, and other minor islands. Total area, 104,751 square miles. On April 20, 1906, the total population, excluding Maoris, was 888,376 (470,891 males and 417,845 females), of whom 476,891 were on North Island, 411,258 on South Island, 288 on Stewart Island, 197 on Chatham Islands, and 5 on Kermadec Islands. The Maoris numbered 47,731 (25,538 males and 22,193 females).

On June 30, 1908, the total population was estimated at 1,000,882. In 1907 there were 8192 marriages (8.91 per 1000 mean population), 25,094 births (27.30 per 1000), and 10,066 deaths (10.95 per 1000). The arrivals and departures in 1907 were 36,108 and 30,378 respectively. The principal cities, with their populations (including suburbs) as estimated at the beginning of 1908, are: Wellington, the capital, 70,947; Auckland, 89,577; Dunedin, 59,495; Christchurch, 73,462; Invercargill, 13,419; Palmerston North, 11,299; Napier, 10,115.

EDUCATION. Public education is free and secular. In 1907 the government primary schools were attended by 140,320 pupils, and private primary schools by 19,324. There are over 100 Maori schools, with 4300 pupils. Of secondary schools there are 8, with 4300 pupils, besides industrial, normal, art, and mining schools. The University of New Zealand is an examining body, with which are affiliated Otago University at Dunedin, Canterbury College at Christchurch, Lincoln College, Auckland University College, and the Victoria College at Wellington.

PRODUCTION. The total value of the mineral production to the end of 1907 was £100,523,086, to which gold contributed £71,528,978; silver, £1,090,751; copper, £18,823; tin, £101; coal, £13,485,259. The value of the mineral production of 1907 was £3,775,835, to which gold contributed £2,027,490; silver, £169,484; copper, £595; tin, £101; coal (1,831,009 tons), £965,766. The gold export in 1908 was 506,447 ounces; silver, 1,731,366 ounces. Rich iron ore has been found in the form of ironsand and brown hematite.

In 1907 the area of public lands alienated or in process of alienation was 26,462,809 acres; the area leased, 17,859,180 acres; neither alienated nor leased, 22,539,451 acres (including 9,000,000 acres of native lands). The total area under cultivation in 1907-8 was 1,873,635 acres, of which 1,824,363 was under crops. The area under artificially sown pasture was 13,125,753 acres. The area and production of the principal crops in

the 1907-8 season were: Wheat, 193,031 acres and 5,567,139 bushels; oats, 386,890 acres and 11,606,700 bushels; barley, 36,177 acres and 1,049,133 bushels; maize, 8880 acres and 503,301 bushels; potatoes, 27,035 acres and 142,999 tons; hay, 80,435 acres. Other crops are: peas, beans, tobacco, vegetables, etc. Orchards and vineyards occupy over 27,000 acres. In 1907 horses numbered 252,832; cattle, 1,816,299; sheep, 20,983,772; pigs, 241,128. Agricultural and dairy products are important exports. The wool production in 1907-8 was 148,560,000 pounds, against 148,169,000 pounds in 1906-7. The sales of wool in 1907-8 were 132,349 bales, of about 334 pounds each—a considerable reduction from the previous season, due to the fall of prices in October, 1907.

A calculation made by the Registrar-General of New Zealand, based on a study of the probable returns for a series of years, showed that the amount of private wealth in 1906 was £304,654,000, or £335 10s. per head of population, against £156,058,273, or £232 per capita, in 1893, and £229,587,916, or £291 per capita, in 1901. The value of public property in 1906 was £62,041,000, consisting of Crown lands, £18,918,000; local authorities' lands, £5,851,000; educational lands, £4,646,000; church and other lands, £3,292,000; railways, £24,092,000; other public works, £5,142,000.

FOREIGN COMMERCE. The imports and exports of merchandise in 1907 amounted to \$80,493,240 and \$97,633,319 respectively, against \$69,608,761 and \$87,563,403 in 1906. The imports and exports of specie in 1907 amounted to \$4,114,016 and \$35,005 respectively. The principal imports in 1907 were: Articles of dress, \$17,416,189 (including apparel and slops, \$3,746,452; boots and shoes, \$1,415,159; cotton piece goods, \$3,523,243; drapery, \$2,989,987; woollens, \$2,307,793); implements, tools, machinery, and iron and steel, \$16,089,600; (hardware, \$2,226,709; iron and steel, \$5,959,744; machinery, \$3,735,342); sugar, \$2,771,430; tea, \$1,306,972; beer, wine, spirits, and tobacco, \$3,921,507; paper, books, and stationery, \$3,146,753; coal, \$1,038,436; drugs and chemicals, \$1,657,110; fruits, \$1,938,194; manures, \$1,142,396; oils, \$1,516,748; timber, \$1,317,747. The principal exports of home produce in 1907 were: Butter, \$7,861,346; cheese, \$3,223,461; gold, \$9,867,118; kauri gum, \$2,822,122; frozen meats, \$16,647,231; phormium, \$4,049,397; skins, \$4,227,045; tallow, \$2,730,030; sawn and hewn timber, \$1,517,728; wool, \$37,265,420. The trade with the principal countries of origin and destination was as follows:

From and to	Imports	Exports
Great Britain.....	\$50,019,692	\$80,462,998
Australia.....	15,220,757	10,810,131
Canada.....	1,047,462	379,673
Other British possessions.....	6,430,710	1,267,065
Germany.....	1,711,285	323,579
United States.....	6,937,899	3,475,106
Other foreign countries.....	2,839,451	950,372

In 1908 imports amounted to about £17,000,000, showing a slight increase, and exports amounted to about £16,000,000—a decrease of about £3,750,000 from 1907.

COMMUNICATIONS. The shipping entered and cleared in 1907 was 2,347,612 tons, of which 132,036 was foreign. The merchant marine in 1906 consisted of 291 steamers, of 136,612 tons, and 317 sailing vessels, of 43,512 tons. The

length of State railways at the end of 1907 was 2474 miles. The railway receipts during 1907 were £2,761,938; expenditure, £1,949,759; net revenue, £812,179; interest on loans, £911,372; leaving a deficit for the year of £99,193. There are also 113 miles of private railway. The length of telegraph line in 1907 was 8948 miles.

FINANCE, ETC. In 1907-8 the revenue was £9,063,989; and the expenditure £8,213,965. The public debt on March 31, 1908, stood at £66,453,897, and the sinking fund at £2,928,930. The military force in 1908 consisted of 362 in the permanent militia, 5209 volunteers (3528 mounted infantry, 1238 artillery, and 389 engineers), 5768 members of rifle corps, 3080 members of cadet corps, 3332 members of rifle clubs, and 406 others. New Zealand contributes £40,000 annually to the maintenance of the British squadron in Australasian waters (see AUSTRALIA). The Governor in 1908 was Lord Plunket. The Prime Minister was Sir Joseph George Ward. In September, 1908, it was reported that important changes were contemplated in the organization of the judiciary. It was proposed to constitute an appeal court, consisting of the chief justice and two other judges, the other three judges, with one new appointment, to constitute the supreme court.

HISTORY.

LABOR CONDITIONS. Among other labor difficulties there was a serious strike in the Blackball Company on account of the dismissal of seven men. It was significant as illustrating the breakdown of the arbitration law. The strikers, on being urged to return to work and let the arbitration court decide the quarrel, refused on the ground that they had no faith in the court's fairness. The court imposed a fine but the strikers refused to pay it. Under the law this exposed them to the penalty of imprisonment, but the Premier opposed this course, favoring an amendment of the arbitration law. The strike was finally settled by mutual agreement. The attitude of the strikers toward the arbitration court was generally approved by the laboring class throughout the country. In reply to criticisms based on New Zealand's labor troubles, and directed against the government labor policy, which, it was alleged, had resulted in the restraint of trade and the discouragement of investors, the Minister of Labor contrasted the private wealth of the Colony in 1890 with that in 1906. In the former year it was 142,632,000 but in the latter it had risen to 304,650,000. See ARBITRATION AND CONCILIATION, LABOR.

IMPORTANT PARLIAMENTARY MEASURES. The Parliamentary session of 1907 which ended late in November of that year had been the longest on record. Its chief measures were the land and tariff acts, the increase of the graduated tax, the establishment of national endowments for old age pensions and education, and the further restriction of Chinese immigration by an educational test in addition to the existing £100 poll tax. Parliament reopened on June 29, 1908. Among the proposed measures were the amendment to the arbitration law, the establishment of the second ballot system in elections, the granting of annuities available for all classes, and the superannuation of employees in certain industries. As to strikes, the Premier declared that some measure must be passed that would deal with them effectively, the pres-

ent arbitration law being clearly of no avail. The new bill modifying radically the existing law was brought in early in July. As finally passed, it replaced the existing Conciliation Boards by Councils of Conciliation, composed of two salaried commissioners, under whom each side would appoint three assessors; mutual agreement to have the force of an award. It also provided that 20 per cent. of the wages should be kept back by the employers until fines fixed by the Conciliation Councils were paid. The measure was criticised by the Opposition on the ground that compulsory arbitration had done only harm. (See **ARBITRATION AND CONCILIATION**; **LABOR**.) The second ballot and public superannuation acts were also passed. The latter provided for triennial valuation and extra government subsidies to maintain the fund. In October, Parliament voted to increase the colony's annual quota to the imperial navy from \$200,000 to \$500,000. Complaint of the government's labor policy continued. The New Zealand Employers' Federation held that the labor legislation combined with the low prices had killed the flax-milling industry. It was argued that a State policy which regulated the cost of production when it could not regulate the selling price was necessarily fatal to industries. See **OLD AGE PENSIONS**.

THE ELECTIONS. At the outset of the campaign in October the Premier declared the policy of the government to be the promotion of industrial development, a cessation of legislation, and a good administration of land settlement. He opposed the idea of compulsory military training as needless and burdensome, and favored the improvement of the voluntary system as the proper policy to pursue. The elections were held on November 17. The results showed a change of feeling toward the government, and the Opposition declared that at last the tide had turned. In the last Parliament the government could count on a majority of 42, but were now sure of only 15, which, however, with the 4 Maori members to be elected would be 19. One second ballot was still undecided at the close of the year. The liquor question played a large part in the campaign, both sides spending a large amount of money on advertising, lectures, etc. Mass meetings were held and the prohibition feeling was very strong. As a result "no license" prevailed in 12 districts, showing a steady gain in the "no license" vote.

OTHER EVENTS. In July a great congress was opened, organized by the new Maori party and consisting of Maori representatives for the purpose of improving the condition of the natives. A warm welcome was accorded to the American fleet, which arrived at Auckland on August 9, and a banquet was given in its honor at Government House. See **CANADA**, paragraph on "All Red" Route.

NIAGARA FALLS. During a shut-down of the power plant of the Niagara Falls Power Company, which took place on June 14 and which caused the closing of the canal of the Niagara Falls Hydraulic and Manufacturing Company, which supplies power to consumers on the American side of the Falls, examinations were made by U. S. Engineers and showed that the elevation of the surface of the Niagara River rose only 1-10 of an inch. This seems to be direct evidence for the fact that, at least so far,

the tapping of the Niagara River above the Falls has had little appreciable influence upon the volume which passes over them. For geology of Niagara Falls and River, see **GEOLOGY**.

NICARAGUA. A republic of Central America. Area, 49,552 square miles; population (1906), about 600,000, nearly all Indians or mixed. In 1907 there were 20,339 births (10,613 males, 9,726 females), 7,657 deaths, and 2,522 marriages. The principal cities, with their estimated populations, are: Managua, the capital, 35,000; León, 45,000; Granada, 25,000; Bluefields, 15,000; Masaya, 15,000; Chinandega, 12,620. The elementary schools had 25,363 pupils in 1905. There are ten colleges. The universities at León and Granada, with faculties in law and medicine, have been consolidated.

PRODUCTION. The gold output amounts to about \$1,000,000 a year. There are also some silver mines. Other minerals are lime, marble, jasper, copper, coal, and oil. The forest products include timber and dyewoods, copaiba, tolu, Peruvian balsam, sarsaparilla, ipecacuanha, China root, serpentaria, and other medicinal plants. Gums and resins are abundant, and the native camphor tree is said to yield a product equal to that produced in the Far East. Vanilla and senna grow freely. The rubber export amounted to 449,609 pounds in 1905, 408,329 pounds in 1906, and was estimated at 350,000 pounds in 1907—the reduction in the last year being due to damage caused by the hurricane in the fall of 1907. The production of refined sugar during the year ending June 30, 1907, amounted to 3,505,752 kilos (of 2 1-5 lbs. each). The by-products consisted of 1,837,179 liters (1 liter = 1.76 pints) of molasses, 1,712,188 kilos of crude sugar, 490,265 liters of aguardiente, and 200,000 liters of alcohol. The Bluefields Steamship Company owns 125 banana plantations, employs 5,000 workmen, and ships 2,000,000 bunches annually to New Orleans. The Kukra River Planting Company has taken up about 15,000 acres on the Atlantic coast for banana plantation. The coffee production for 1907-8 was estimated at 137,500 Spanish quintals (of 101 pounds each), or about 49,000 quintals less than in 1906-7. In October, 1908, the estimate of the 1908-9 coffee crop was 166,000 quintals. Other products are cacao, tobacco, and cotton, besides maize and rice for local consumption. Tobacco growing is regulated by the government, and the revenue therefrom has been leased for a period of 24 years from January 1, 1908, for 500,000 pesos annually. (In July, 1908, the peso was worth about 39.3 cents.) The sale of native spirits, a government monopoly, was leased for six years from January 1, 1904, for a payment of 1,341,000 pesos a year during the first two years and 1,420,000 pesos a year during the following four years. From January 1, 1908, the sale and importation of matches have become a government monopoly.

COMMERCE AND COMMUNICATIONS. The imports and exports in 1906 amounted to 3,408,830 and 4,231,048 pesos respectively. The principal exports were: Coffee, 8,808,280 kilos, valued at 1,375,679 pesos; 1,401,595 bunches of bananas, valued at 700,069 pesos; gold bullion, 527,423 pesos; gold amalgam, 343,546 pesos; 296,103 kilos of rubber, valued at 385,472 pesos; 3,373,963 kilos of mahogany, valued at 284,321 pesos; 11,087 head of cattle, valued at 33,044 pesos; hides, 120,367 pesos; coconuts, 90,953 pesos;

silver coin, 44,220 pesos; sugar, 23,467 pesos; cedar, 41,465 pesos. About two-thirds of the foreign trade is with the United States. According to United States returns the imports from Nicaragua in the fiscal year 1908 amounted to \$1,160,832, and the exports to Nicaragua, \$1,574,879. In November, 1908, monetary exchange rose to 950, — 400 points above the normal rate. This caused a great depression in trade. The principal ports are Bluefields and Corinto. There are 171 miles of national railway, which have been leased to a private company since 1903, and are operated in connection with steamboat navigation on the lakes, and 20 miles of private railway on the Atlantic coast. There are 3,150 miles of telegraph wire.

FINANCE, ETC. The revenue and expenditure for 1907 were estimated at 10,219,048 and 10,286,519 paper pesos respectively. The external debt in 1907 consisted of the English debt, £242,500; the American debt, \$1,000,000; and the French debt, 12,500,000 francs. The internal debt stood at the end of 1904 at 12,378,808 paper pesos. The President in 1908 was J. Santos Zelaya, whose term is 1906-1912.

Military service is compulsory between the ages of 17 and 55, the period of active service being one year. The active army consists of 4,000 men in time of peace, and 40,000 men can be mobilized for war.

HISTORY. In January, 1908, commercial treaties with Belgium and Italy were negotiated. A convention was concluded with Great Britain, in which the latter recognized Nicaraguan sovereignty over the Mosquito Reservation. The uprising in Honduras (q. v.) caused President Zelaya to increase the Nicaraguan army and, according to report, also to arm a number of refugees from Salvador. Subsequently he filed charges against Guatemala and Salvador with the Central American Court of Justice at Cartago, Costa Rica, but his claims were rejected as without proper foundation (see **CENTRAL AMERICA**). In March the President appointed the minister and consul-general to France as members of the Hague Court of Arbitration. A five-year concession was granted to a Mexican, to introduce Chinese and Japanese plantation laborers. The concession was conditioned on the establishment within a year of a line of steamers between Far Eastern and Central American ports.

NICHOLS MEDAL. See **CHEMISTRY, INDUSTRIAL**.

NICKEL. A small amount of nickel and cobalt occurs with lead ores found in southeastern Missouri and in Oregon, but for practically its entire supply the United States depends upon imports which come either from the Sudbury District in Ontario or from New Caledonia. In 1908 the output of the Sudbury mines was estimated as under that of 1907, when it amounted to 10,972 tons, and competent authority placed it at about 10,000 tons. New ore deposits were beginning to be developed during the year in the Sudbury District and work was begun on deposits along the northern range, some of which are as large if not larger than those of the south: The construction of the Moose Mountain branch of the Canadian Northern railways put excellent shipping facilities at the disposal of these new enterprises, while the development of water power on the Wahnapiet River for use in the mines was being considered.

The Ontario production of nickel in 1907 was larger than the combined production of the other deposits of the world. The production of nickel in ore and matte in Ontario, since 1901, is as follows:

PRODUCTION OF NICKEL IN ONTARIO, 1901-7,
in SHORT TONS.

Year	Ore smelted	Matte obtained	Nickel in matte
1901	270,380	45,134	4,441
1902	233,388	24,691	5,347
1903	209,030	13,832	6,253
1904	118,470	8,924	5,274
1905	257,421	17,388	9,438
1906	340,059	20,364	10,745
1907	358,076	22,041	10,095

The operators of New Caledonia felt very severely the competition of the Canadian mines in 1907 and the nickel ore exports showed a considerable decrease. The cobalt exports showed an increase, but this was said to be due to the shipment of ore mined in 1906.

The ore exported from New Caledonia during the five years 1903-7 is shown in the following table:

QUANTITY OF NICKEL AND COBALT ORE SHIPPED
FROM NEW CALEDONIA, 1903-7, IN
SHORT TONS.

Year	Nickel ore	Cobalt ore
1903	80,865	9,140
1904	108,747	9,881
1905	138,106	8,729
1906	144,057	3,070
1907	112,112	4,345

The imports for consumption of nickel into the United States for 1902-7 were as follows:

IMPORTS OF NICKEL FOR CONSUMPTION INTO THE
UNITED STATES, 1902-7.

Year	Nickel, nickel ore and matte, nickel oxide, alloys of nickel with copper, etc.		Value of manufactured articles of nickel	Total value
	Pounds.	Value.		
1902 ..	33,942,710	\$1,407,521	\$30,128	\$1,437,649
1903 ..	36,217,985	1,456,605	37,284	1,493,889
1904 ..	19,739,315	1,118,541	2,950	1,121,491
1905 ..	31,072,206	1,958,840	3,291	1,962,131
1906 ..	34,082,042	1,867,568	8,963	1,876,531
1907 ..	18,598,638	2,233,867	9,159	2,243,026

As nickel is used extensively to increase the hardness and toughness of steel it was evident that the depression in the steel industry would result in a lessened demand for the metal during 1908 and such proved to be the case.

NITROGEN. See **CHEMISTRY, INDUSTRIAL; FERTILIZERS.**

NOBEL PRIZES. These prizes were established from a fund of \$8,400,000 left by Dr. Alfred Bernhard Nobel for the purpose of award-

ing annual prizes to those "persons who shall have contributed most materially to benefit mankind during the year immediately preceding." The prizes are distributed in accordance with statutes signed by King Oscar of Sweden, January 29, 1900. The value of each prize now amounts to about \$38,000, a considerable portion of the income being absorbed in the administrative expenses and scientific investigations of the committees. The stipulation that the award should be for achievements of the preceding year has been, to a large extent, disregarded, as in many cases the life work of the recipients had been accomplished and its value recognized by the world long before the establishment of the foundation. The prizes in science and literature are given at Stockholm, and the prize for peace at Christiania on the anniversary of the death of the founder on December 10, on nominations submitted before February 1st preceding. The right to make nominations is bestowed upon members of the Swedish academies, members of corresponding academies of other countries, professors holding proper chairs in Scandinavian and certain foreign universities, recipients of Nobel prizes, and other persons of distinction. The prizes awarded since the foundation of the fund, including the awards of 1908, are given in the table below:

THE RECIPIENTS OF THE NOBEL PRIZES.

Name	Year	Nationality
<i>Physics</i>		
Wilhelm Konrad Röntgen.....	1901	German
{ H. A. Lorentz.....	1902	Dutch
{ P. Zeeman.....	1902

NODZU, MICHITSURA, Marquis. A Japanese general, died on October 10, 1908. He was born at Satsuma on November 30, 1840, of a Samurai family, and early entered the military service. He served in the Imperial Army during the civil war of 1877 and reached the rank of lieutenant-general in 1885. During the war with China in 1894-95 he commanded the Fifth Division and later the entire army in the field. At the beginning of hostilities he forced the passage of the Yalu River after inflicting a severe defeat on the Chinese at Ping-Yang. He was made a Count of the Empire for his services and at the beginning of the war with Russia in 1904 was sent to Korea in command of the Fourth Army. He again forced the passage of the Yalu and later took a principal part in the defeat of the Russians at Liao-Yang after a desperate battle lasting five days. His army formed the Japanese centre at the battle of Mukden and his stubborn defense of his position was an important contributing cause to the Japanese victory. He was made a Marquis and Field Marshal for his services in Manchuria and at the time of his death was a member of the Council of Marshals of the Empire. His chief characteristics as a commander were his dogged tenacity and his willingness to sacrifice men if results were to be attained thereby. In private life he had the simple dignity and courtesy of the Samurai clan to which he belonged.

NORTH CAROLINA. One of the South Atlantic Division of the United States. Its area is 52,426 square miles. The population, according to Federal estimate made in 1908, was 214,498.

MINERAL PRODUCTION. From a report prepared by the State Geologist were taken the following facts relating to the mineral production of North Carolina in 1907. Notwithstanding the financial condition and general business depression there was a decided increase in the total value of the production of minerals in the State during that year over 1906. In the two products in which a falling off might have been expected, stone and clay products, there was a decided increase in value as compared with the previous year. The value of clay production in 1906 was \$1,182,660, while in 1907 it was \$1,316,308. The value of stone products in 1906 was \$854,302, while in 1907 it was \$958,919. In metallic minerals there was a slight increase in the production of gold, silver, and iron, but a decided decrease in the production of copper. The latter was due to the sharp decline in the price of copper during the latter half of 1907, which resulted in the closing down of nearly all the copper mines in the State. As to the non-metallic minerals there was a slight increase in the production of mica, for which the State is especially noted, and in talc and soapstone. The production of monazite, however, which had been steadily increasing since 1906, showed a very large decrease which was due to the low value of thorium nitrate, which is the commercial salt derived from monazite. The total value of the mineral production of the State in 1907 was \$3,176,105, as compared with \$3,007,601 in 1906. The value of the production of the leading metals and minerals was as follows: Mica, sheet, 1907, \$209,956; 1906, \$205,756; mica, scrap, \$15,250, 1907, \$11,940 in 1906; gold, \$82,195, 1907, \$122,008, 1906; silver, \$14,299, 1907, \$30,944, 1906; copper, \$116,416,

1907, \$135,829, 1906; iron, \$113,488, 1907, \$75,638, 1906; talc and pyrophyllite, \$74,347, 1907, \$66,979, 1906, sand-lime brick, \$38,808, 1907, \$32,975, 1906; kaolin, \$35,505, 1907, \$90,036, 1906; monazite, \$54,824, 1907, \$125,910, 1906. Among other minerals produced were zircon, pyrites, and graphite. Mineral water was produced in 1907 to the value of \$40,302, and in 1906, \$31,413. According to the figures of the United States Geological Survey, from whose reports the statistics given above are taken, the value of the total mineral production of the State in 1907 was \$2,961,381, as compared with a value in 1906 of \$3,062,847.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 50,166,000 bushels, valued at \$39,631,000 from 2,787,000 acres; winter wheat, 5,680,000 bushels, valued at \$6,078,000 from 568,000 acres; oats, 3,300,000 bushels, valued at \$2,079,000 from 200,000 acres; rye, 125,000 bushels, valued at \$122,000 from 14,000 acres; buckwheat, 82,000 bushels, valued at \$164,000 from 5,000 acres; rice, 15,120 bushels, valued at \$15,120 from 600 acres; potatoes, 1,975,000 bushels, valued at \$1,521,000 from 25,000 acres; hay, 262,000 tons, valued at \$3,537,000 from 175,000 acres; tobacco, 134,000,000 pounds, valued at \$14,070,000 from 200,000 acres. The production of tobacco increased materially in 1908 over the figures of 1907, which were 100,875,000 pounds, while the acreage increased in the former year from 161,400. North Carolina ranks second in the production of tobacco, being surpassed only by Kentucky. The cotton crop in 1908 was estimated at 619,000 bales as compared with 652,000 bales in 1907. The maximum of the cotton crop was 712,218 bales in 1904-5. The cultivation of rice has practically ceased in the State, and larger areas are being devoted to early gardening for northern markets. The number of farm animals on January 1, 1909, was as follows: Horses, 192,000; mules, 179,000; dairy cows, 294,000; other cattle, 404,000; sheep, 222,000; swine, 1,398,000. The estimated value of the wool clip in 1908 was \$202,130.

MANUFACTURES. The progress between the census of 1900 and that of 1905 was very rapid. The figures for 1905, including only establishments classed as factories, were: capital invested, \$141,000,600; wage-earners, 85,339; value of products, \$142,520,700. These three items exceeded the corresponding ones of 1900 by 106.5, 18, and 67.1 per cent. respectively. Of the wage-earners, 18,301 were women, and 11,632 were children under 16, these numbers being respectively 21.3 and 13.9 per cent. greater than in 1900. The value of products of leading industries and the percentage gain over 1900 (in parentheses) were: Cotton goods, \$47,354,000 (66.5); chewing and smoking tobaccos and snuff, \$25,488,700 (87.1); lumber and timber products, \$15,731,000 (28.6); flour and grist mill products, \$6,863,700 (46); furniture, \$6,181,600 (300); cottonseed oil and cake, \$3,748,800 (40); planing mill products, \$3,402,400 (17.6); fertilizers, \$3,098,600 (107); and tanned and finished leather, \$2,662,100 (77). Cigars and cigarettes and hosiery and knit goods showed slightly smaller values. North Carolina has attained to third place in the manufacture of cotton goods and second place in the manufacture of chewing and smoking tobacco, being exceeded by Massachusetts

and South Carolina in the former and by Missouri in the latter. The number of active cotton spindles increased from 1,113,432 in 1900 to 1,880,950 in 1904, 2,604,444 in 1907 and 2,944,404 in 1908. The consumption of cotton in the mills in 1908 was 609,305 bales. The principal centres were accredited with the following values in 1905; Winston, \$11,353,000; Charlotte, \$4,849,600; and Wilmington, \$3,155,400.

FISHERIES. The latest exact data for fisheries in North Carolina were published in 1905 and are for the year 1902. At that time there were reported 14,755 persons engaged in the industry, \$1,973,441 invested, and products valued at \$1,739,661. The most valuable catches were: Shad, \$334,808; oysters, \$268,363; mullet, \$187,642; squeteague, \$156,247; striped bass, \$113,631, Carteret and Dare counties. The North Carolina Fish Commission, which was established in 1907 estimates that the value of the production of 1908 would be an increase of about 10 per cent. of the figures for 1902. This is true also, in a general way, of the other figures given above.

EDUCATION. The report of the superintendent of public instruction for the fiscal year 1907 showed a total school population of 709,609, as against 706,528 in 1906. The white school population in 1907 was 479,195, as against 475,477 in 1906. The colored school population was 230,414, as against 231,051 in 1906. The total enrollment in all schools for 1907 was 483,927, as against 483,180 in 1906. The white enrollment in 1907 was 332,962, as against 330,780 in 1906. The colored enrollment was 150,965, as against 152,400. The total average daily attendance of 1907 was 296,952, as against 293,046. The white average daily attendance was 208,157, as against 205,517. The colored average daily attendance in 1907 was 88,795, as against 87,529 in 1906. The total number of teachers employed in 1907 was 10,146, as against 9,871 in 1906. The white teachers numbered in 1907, 7,438, the colored teachers 2,708. The average annual amount paid to each teacher in 1907 was \$152.94. The average monthly salary of white teachers in 1907 was \$33.60. The average salary of colored teachers in 1907 was \$25.40. The total expenditure for public schools in 1907 was \$2,453,790.82.

FINANCE. The report of the treasurer for the biennial period 1907-8 showed a balance in the treasury on December 1, 1906, of \$405,955. The receipts for the fiscal year 1907 were \$2,603,292 and for 1908 were \$2,886,439, making the receipts for the two years \$5,469,732. The total disbursements for 1907 were \$2,655,262, and for 1908, \$2,605,954, making the total disbursements for the period \$5,261,237. The largest receipts are from taxes on insurance companies, from dividends of the North Carolina Railroad, from the railroad property tax, from State prison earnings, and from county taxes. The chief disbursements are for education, for the State prison, interest on debt, and for pensions.

CHARITIES AND CORRECTIONS. Improvements were made in many of the charitable and correctional institutions of the State in 1908. At Raleigh Hospital a wing for 100 patients was added, and a contract given for another wing to accommodate 100. Several buildings were erected for the epileptic insane. At Morgantown Hospital, a nurses' home was erected, which leaves room for 100 more patients in the main building. One cottage costing \$5,000 was built at the Stonewall Jackson school, and land was bought for a Tuberculosis Sanitarium. The

annual appropriation for Confederate soldiers' pensions was \$400,000. A law passed in 1907 requires the compulsory education of white deaf and blind children in the State.

POLITICS AND GOVERNMENT. There was no regular meeting of the State legislature in 1908, but on January 8 Governor Glenn issued a call for a special session to amend the railway rate law passed in 1907. On March 23 the United States Supreme Court declared this law unconstitutional. (See **RAILWAYS.**) The most important political event of the year in the State was the election on May 26, which directed that there should be prohibition in the State after June 1, 1909. The issue was the ratification or rejection of the law passed at the special legislative session of 1907. The State voted to ratify the measure by a majority of about 40,000, and on June 19 Governor Glenn issued a prohibition proclamation. In April a suit was begun in the United States Circuit Court at Asheville to determine whether or not the United States owns all the land in the eight western counties of the State. The basis of the government's claim is that the State, before the adoption of the Federal Constitution, made a treaty granting all this land to the Cherokee Indians. This was done under the articles of Federation, under which the State had treaty-making powers. After the adoption of the constitution, it is claimed, the United States obtained the property from the Indians, by treaty, in exchange for lands in Indian Territory, now Oklahoma. North Carolina treated this cession as restoring the State's rights, and granted the lands to settlers, on which grants the present holders base their claims. The government proposes to make the land a National Forest, leaving holders of improved property in peaceable possession. The area includes the forest reserve of G. W. Vanderbilt, comprising over 50,000 acres.

CONVENTIONS AND ELECTIONS. The Republican State Convention met and selected delegates to the National Convention, instructed to vote for W. H. Taft, and in convention at Charlotte, August 27, nominated J. P. Cox for governor. On July 29 the Democrats selected delegates instructed to vote for W. J. Bryan for president, and nominated W. W. Kitchin for governor. Mr. Kitchin was a Representative of the State in Congress. In the election of November 3 he was elected by a plurality of about 37,000, and the State was carried for W. J. Bryan by about 22,000. The detailed vote for the National and State tickets was as follows: Bryan, 136,928; Taft, 114,887; Debs, 345. Kitchin, 145,102; Cox, 107,760.

STATE OFFICERS. Governor, R. B. Glenn; Lieutenant-Governor, F. D. Winston; Secretary of State, J. B. Grimes; Treasurer, B. R. Lacey; Auditor, B. F. Dixon; Attorney-General, R. D. Gilmer; Superintendent of Education, J. Y. Joyner; Commissioner of Agriculture, S. L. Patterson; Commissioner of Insurance, J. R. Young; Adjutant-General, T. R. Robertson—all Democrats.

JUDICIARY: Supreme Court, Chief Justice, Walter Clark, Rep.; Justices, Geo. H. Brown, Dem., Wm. A. Hoke, Dem., Henry G. Connor, P. D., Walker, Clerk, Thomas S. Kenan, Dem.

The State legislature of 1909 is composed of 46 Democrats and 4 Republicans in the Senate, 99 Democrats and 21 Republicans in the House. The State representation in Congress will be

found in the article **UNITED STATES**, under the section *Congress*.

NORTH DAKOTA. One of the North Central Division of the United States. Its area is 70,837 square miles. The population in 1908, according to Federal estimate, was 511,966.

MINERAL RESOURCES. The mineral products of the State are relatively unimportant. They include clay products, coal, natural gas, and stone. The aggregate value in 1907 was \$875,180 as compared with a value of \$731,805 in 1906. Of this value the coal produced amounted to \$560,199, as compared with a value of the product in 1906 of \$269,873.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to figures of the United States Department of Agriculture, were as follows: Corn, 3,856,000 bushels, valued at \$2,314,000 from 162,000 acres; spring wheat, 68,428,000 bushels, valued at \$62,954,000 from 5,899,000 acres; oats, 32,737,000 bushels, valued at \$13,757,000 from 1,399,000 acres; barley, 18,330,000 bushels, valued at \$8,432,000 from 940,000 acres; rye, 432,000 bushels, valued at \$281,000 from 24,000 acres; flaxseed, 13,770,000 bushels, valued at \$16,386,000 from 1,530,000 acres; potatoes, 2,550,000 bushels, valued at \$1,428,000 from 30,000 acres; hay, 243,000 tons, valued at \$1,166,000 from 187,000 acres. The State ranks first in the production of flax, third in wheat, and fifth in barley. The wheat crop of 1908 considerably exceeded that of 1907, which was 55,130,000 bushels. The largest wheat crops were those of 1905 and 1906, 75,623,000 and 77,896,000 respectively. The area devoted to flax has more than doubled in the last five years. The number of farm animals in the State on January 1, 1909, was estimated as follows: Horses, 678,000; dairy cows, 235,000; other cattle, 642,000; sheep, 621,000; swine, 226,000. The estimated value of the wool clip in 1908 was \$390,000.

MANUFACTURES. Manufacturing is of minor and only local importance. The total value of factory products in 1905 was only \$10,218,000, though this was a gain of 63.2 per cent. over 1900. Flour and grist mill products represented a value of \$6,463,228 in 1905, printing and publishing, \$1,110,400, and dairy products, \$562,480. These three values were respectively 68, 54, and 300 per cent. greater than corresponding values in 1900.

EDUCATION. The legislature of 1907 increased the annual appropriation for State aid of high schools from \$25,000 to \$45,000. The same year stimulus was given to the enforcement of the compulsory school law by requiring 50 per cent. attendance as a pre-requisite for the enumeration on the basis of which the State tuition fund is distributed. In 1907 there were 1660 school districts, with a total of 4054 schools. Of the schools, only 298 were graded. The school population (ages 6 to 20) was 143,089 in 1908. The total enrollment in 1907 was 118,205 and the average total attendance, 72,589. The length of the school term averaged 145 days, there being 2338 schools of at least seven months, 1035 of six months, 417 of five months, 374 of four months and 214 of three months or less. The high school enrollment was 5250. The teachers employed numbered 6364, of whom 5198 were women. The average monthly salary of men teachers was \$53.92, and of

women \$45.68. A law of 1905 made provision for the payment of a minimum salary of \$45.00 per month. The total expenditures for school purposes in 1905 were \$3,205,496. The total indebtedness of school districts was \$2,649,035.83. The permanent fund for common schools in 1907 was \$8,337,000, and for the University and other institutions, \$3,681,000. These funds were derived from the sale of school lands, of which the State still owned 2,006,930 acres in 1906.

CHARITIES AND CORRECTIONS. A law of 1907 provided for the parole of certain classes of prisoners under suspended sentence. The State institutions are as follows: Blind Asylum, Bathgate; Hospital for Insane, Jamestown; Industrial School, Ellendale; Institution for the Feeble-minded, Grafton; Penitentiary, Bismarck; Reform School, Mandan; School for Deaf and Dumb, Devil's Lake. The total expenditure for the maintenance of the institutions of the State from January 1, 1907, to August 30, 1908, was \$323,857.78, and the expenditure for building for the same period, \$252,224.

POLITICS AND GOVERNMENT. There was no meeting of the State legislature in 1906. At the Republican State Convention held on May 14 the delegates chosen were instructed to vote for W. H. Taft for president. The delegates chosen to the Democratic National Convention were instructed to vote for W. J. Bryan. C. A. Johnson was nominated for governor by the Republicans, and John Burke was nominated for re-election by the Democrats. In the election of November 3 the vote for National and State tickets was as follows: Taft, 57,771; Bryan, 32,900; Debs, 2,411; Chafin, 1,549; Burke, 49,346; Johnson, 47,093. In the Senatorial primaries M. N. Johnson defeated Senator Hansborough, who was a candidate for re-election.

STATE OFFICERS. Governor, John Burke; Lieutenant-Governor, R. S. Lewis; Secretary of State, Alfred Blaisdell; Treasurer, G. L. Bickford; Auditor, D. K. Brightbell; Attorney-General, Andrew Miller; Superintendent of Education, W. L. Stockwell; Adjutant-General, to be appointed; Commissioner of Agriculture, W. C. Gilbrath; Commissioner of Insurance, E. C. Cooper; Commissioner of Public Lands, O. I. Hegge—all Republicans, except Burke, Dem.

JUDICIARY. Supreme Court: Chief Justice David E. Morgan; Justices, Chas. J. Fisk, B. F. Spalding; Clerk, R. D. Hoskins—all Republicans.

The State legislature of 1909 is composed of 128 Republicans and 19 Democrats. The State representation in Congress will be found in the article UNITED STATES, under the section *Congress*.

NORTHERN NIGERIA. A British protectorate in West Africa. Area, 256,400 square miles; population (1906), estimated at 8,782,000. The Anglo-German boundary commission finished its labors in the latter part of 1907. The administration headquarters is at Zungeru, near the Kaduna river, a tributary of the Niger. The southern portion is covered with dense forests, especially along the river banks. The central portion is more open, and the extreme north is on the edge of the desert. The principal products are rubber, palm-kernels, palm-oil, gum, dye woods, mahogany, and ebony. Ivory, ostrich feathers, and tanned goatskins are also exported. Cotton is largely grown by the natives, especial-

ly in the Zaria and Kano provinces, but most of it is consumed locally. The export of cotton on Government steamers alone, exclusive of that carried by trading firms, amounted in 1907 to 282,240 pounds. Maize, millet, guinea corn, and tobacco of good quality are also cultivated by the natives. The protectorate is the hinterland of Southern Nigeria (q. v.), has no fiscal frontier, and there are no returns of imports and exports. The Niger, with its tributaries, is the main artery of traffic. A railway is in construction from Baro, the highest point to which the Niger is navigable during the whole year, to Bida. Its extension has been authorized to Zungeru, Zaria, and Kano, and it will connect with the Lagos (see SOUTHERN NIGERIA) line to Jebba, on the Niger. The first sleeper on the Baro-Kano railway was laid on Jan. 6, 1908. There are over 18 miles of telegraph line. The Imperial subvention in 1907-8 was £295,000; in 1908-9, £290,000. The Governor in 1908 was Sir E. P. C. Girouard.

NORTHWESTERN UNIVERSITY. An institution of higher learning at Evanston, Ill., founded in 1851. The College of Liberal Arts, the College of Engineering, the School of Music, the Evanston Academy, and the School of Oratory are situated at Evanston, twelve miles from Chicago. The Law School, the School of Pharmacy, the Dental School, and the School of Commerce are located in Chicago. In 1907-8 the attendance in all departments was 3,997, and the teaching staff numbered 358. The distribution of students is as follows: College of Liberal Arts, 1,037; Medical School, 684; Law School, 274; School of Pharmacy, 160; Dental School, 357; School of Music, 321; School of Commerce, 213. The College of Engineering was established by an act of the trustees in 1907 and the School of Commerce was inaugurated in the following year, 1908. The admission requirements have been advanced to one year of college work in the medical school and a high school graduation in the Dental School. A plan for the future developed of the campus has been proposed and a new building of engineering and a new gymnasium are in process of construction. The libraries of the University contain 126,051 volumes and 74,576 pamphlets. The expenditure for educational purposes in 1907-8 was \$60,188. The property and endowment aggregate \$9,038,604. The President is Abram Winegardner Harris.

NORTON, CHARLES ELIOT. A distinguished American scholar and educator, died at his home in Cambridge, Mass., on October 21, 1908. He was born in Cambridge, on November 16, 1827, a son of Andrews Norton (1786-1853), who graduated at Harvard in 1804 and became Dexter professor of sacred literature. Charles Eliot graduated at Harvard in 1846, entered a commercial house in Boston the same year, and three years later voyaged to the East Indies as a supercargo. His natural preference for literature, however, soon caused him to abandon the career of a merchant for that of the scholar, and he traveled in India and Europe in 1850-51, and lived in Europe from 1855 to 1857 and again from 1865 to 1873. In 1862-68 he was co-editor, with James Russell Lowell, of the *North American Review*, and in 1875 he was appointed professor of the history of art at Harvard, a chair which he held until 1898, when he became professor emeritus. His principal courses of lectures at Harvard were on

"The History of Fine Arts and their Relation to Literature," "The Rise and Fall of the Arts in Athens and in Venice," "The Arts of the Age of Pericles," and discussions of the art of the Renaissance, of Gothic and Romanesque art, and of Florentine and Venetian art. Professor Norton was a profound student of Dante, and in 1882 introduced at Harvard a course on "The Interpretation of the *Divina Commedia*," which he supplemented, in 1886, by a course on "The *Vita Nuova*, and the *Divina Commedia*." His fine appreciation and thorough knowledge of Dante are revealed in his translations of the *Vita Nuova* (1867), and of the *Divina Commedia* (1891), admirable interpretations of those masterpieces. His other publications include *Considerations on Some Recent Social Theories* (1853), *The New Life of Dante* (1859), *Notes of Travel and Study in Italy* (1860), and *Historical Studies of Church-building in the Middle Ages* (1860).

Professor Norton was on terms of warm personal friendship with John Ruskin, Thomas Carlyle, James Russell Lowell, and George William Curtis. Especially intimate and sympathetic were his relations with Ruskin, whom he met by chance on Lake Geneva in 1855—a meeting of which Ruskin wrote in his *Praeterita*: "And thus I became possessed of my second friend after Dr. John Brown, and of my real tutor, Charles Eliot Norton." The lives and minds of both men were profoundly influenced by this friendship, and when Ruskin died it was natural that Professor Norton should become his literary executor and should edit his works and letters (1904). Similarly when differences appeared between the family of Carlyle and James Anthony Froude, Professor Norton was selected to edit *The Correspondence of Carlyle and Goethe* (1887), *The Correspondence of Carlyle and Emerson* (1888), and *Carlyle's Letters and Reminiscences* (1887). He was also the literary executor of Lowell, and edited his *Letters* (1893), and he prepared for the press George William Curtis's *Orations and Addresses* (3 vols., 1893-94). With Longfellow, as well, he had come in close personal touch, and especially just after his return from Europe in 1857, when the poet was making his translation of the *Divina Commedia*, a rendition which owes much to the critical acumen and scholarship of Professor Norton. And it is of more than passing significance that Professor Norton was the first American critic to see the matchless beauty of Fitzgerald's *Omar Khayyám*, an appreciation which established another enduring friendship. He had an active part in the founding of the Archaeological Institute of America in 1879, and was its president until 1890; he succeeded Lowell as president of the Dante Society; and for many years was an overseer of Harvard. His activities outside his own special field of letters included his secretaryship of the Loyal Publication Society which, during the Civil War, distributed great quantities of literature supporting the Union cause, while his editorship of the *North American Review* during the same period was very influential in the same direction. In more recent years he had repeatedly spoken in no uncertain words on public questions of moment, the Spanish war policy and the issue of imperialism, for instance, both of which he strongly opposed.

From Harvard (in 1887) and from Yale (in 1901), Professor Norton had received the degree of LL.D., from Cambridge, that of the L.H.D. in 1884, from Oxford that of D.C.L. in 1900.

NORWAY. A kingdom of the Scandinavian peninsula, covering an area of 124,122 square miles. Its population numbered 2,240,032 in 1900, and was estimated at 2,330,364 on December 31, 1907. The movement of population in 1906 was as follows: Marriages, 13,590; births, 61,316; deaths, 31,214; emigrants, 21,967. Christiania, the capital, had 227,628 inhabitants in 1900; Bergen, 72,251 (80,000 in 1905); Trondhjem, 38,180; Stavanger, 30,613.

PRODUCTION. The number of codfish caught off the coasts of Norway during the 1908 season was 48,217,000, against 47,625,000 in 1907. The fisheries off the Lofoten Islands yielded 13,300,000 cod in 1908, against 18,700,000 in 1907; the Finmarken coast, 2,100,000 in 1908, against 3,200,000 in 1907. The herring fisheries yielded 348,000 barrels in 1908, against 213,100 barrels in 1907. The catch of mackerel in 1908 was 42,000 barrels, nearly all of it shipped to the United States. The yield of refined cod-liver oil in 1908, 13,727 hectolitres, against 12,720 in 1907. The Norwegian fishing fleet consisted in 1906 of 2,355 small sail-boats, 1,398 large sail-boats, 647 motor boats, and 176 steamboats, of an aggregate value of \$6,697,400. The number of persons employed in the sea-fisheries in 1906 was 108,000. The fishing industry has grown in importance since the introduction of motor engines and motor boats, the demand for which is steadily increasing. The catch is now larger than formerly, but the profits are not always so satisfactory, as the expenses for a motor boat are much larger than for an ordinary fishing boat. The decked motor boat affords the fishermen better protection in bad weather, besides greater safety. There are three funds from which Norwegian fishermen can secure loans for the purchase of fishing boats: The old sea-fish fund, which advances three-fourths to two-thirds the value of the boats, to be paid back in ten or fifteen years, in yearly payments, with interest at the rate of 2½ per cent. per annum; the new fish fund, which advances loans to the extent of one-half the value of the boat, payable in ten yearly payments; the Finmarken fund, which loans to the extent of four-fifths the value of the boats, to be paid back in ten yearly payments at 2½ per cent. interest. None of these funds requires payments for the first year of the loans.

About four years ago a law was passed prohibiting the catching of whales within three miles of the Norwegian coasts. This was due to the belief that the whales, in pursuit of shoals of herring and other fish, drive them under the shores. The whaling companies were to some extent remunerated for their losses by the government. Since that time Norwegian whaling companies have extended their operations to Spitzbergen and to the Antarctic, around the Falkland and South Shetland islands, and to Kerguelen Island, as well as to the South African coast (see NATAL).

The wheat production in 1907 was 200,000 bushels, against 303,000 in 1906; oats in 1907, 6,000,000 bushels, against 9,297,000 in 1906. The

country depends upon foreign imports for its cereals. In 1907 there were imported 351,414 tons of ground and 86,237 tons of unground cereals, mostly rye and barley, of which Russia furnishes over one-half. The imports of 1908 were larger, owing to the failure of the 1907 crops. The use of wheat flour is extending, the imports having increased from 4,150,000 kilos in 1871 to 50,200,000 kilos in 1907.

Mining shows considerable progress, especially in the northern counties. These mines are operated largely by foreign capital. The number of persons employed in the mines was 4,500 in 1905, of which 3,400 were employed in the copper mines. The total exports of minerals in 1907 were as follows: 187,983 tons of pyrites, valued at \$11,085,820; 1,581 tons of copper ore; 98,143 tons of iron ore; 34,450 tons of iron briquettes; 1,033 tons of refined copper, worth \$456,832; and 2,237 tons of raw zinc, worth \$360,000. Granite blocks and dressed stone to the amount of 145,791 tons, valued at \$532,000, were exported, chiefly to England. The output of cement in 1907 was 204,000 fads (375 lbs. net each), and the consumption, 294,000 fads.

The lumber industry and pulp and paper manufacture have undergone swift development. In 1907, 556,605 tons of mechanical pulp and cellulose, valued at \$9,304,665, and 98,698 tons of printing and packing paper and cardboard, valued at \$4,369,150, were exported.

The electric industry, catering to foreign demands especially, is beginning to make great strides. The exports of calcium carbide in 1907 amounted to 22,591 tons, valued at \$1,089,800. The cotton industry employed in the year ending August 31, 1908, 74,936 spinning spindles, and consumed 20,794 bales of cotton, of which 17,081 bales were American and 3466 East Indian. For the preceding year the cotton consumption was reported at 10,647 bales.

FOREIGN COMMERCE. The imports and exports in 1907 amounted to 385,708,000 and 253,101,000 crowns respectively, against 343,524,000 and 245,923,000 (31,086,300 crowns' worth of foreign produce) in 1906. The imports and exports of 1907 were classed as follows, in crowns (1 crown = 26.8 cents):—

	Imports	Exports
Foods	118,500,000	80,000,000
Raw materials.....	107,100,000	85,400,000
Manufactures	74,400,000	64,500,000
Miscellaneous	85,700,000	23,200,000

The principal imports in 1907 were: Cereals, 64,300,000 crowns; colonial goods, 26,000,000; animals, 17,000,000; coal, 30,000,000; metals, 18,900,000; tissues, 40,900,000; oils, 25,100,000. The principal exports in 1907 were: Animals, 75,000,000; timber, 44,000,000; minerals, 26,300,000; paper and paper products, 17,700,000; wood-work, 43,100,000. The trade in 1907 with the principal countries of origin and destination was as follows, in crowns:—

	Imports	Exports
Great Britain.....	104,779,000	95,062,000
Germany	101,387,000	39,852,000
Sweden	34,060,000	6,821,000
Denmark	25,181,000	12,401,000
France	6,642,000	10,256,000
Netherlands	17,853,000	23,602,000
Belgium	15,017,000	10,726,000
Spain	2,746,000	11,879,000
United States.....	14,545,000	10,331,000

COMMUNICATIONS. The total shipping entered in 1907 was 11,796 ships of 4,402,709 tons (2,023,026 Norwegian), and cleared, 12,864 ships of 4,416,458 tons (2,017,240 Norwegian). On January 1, 1908, the merchant marine consisted of 7,596 ships of 1,573,127 registered tons, including 5,718 sailing boats of 758,109 tons, and 1,878 steamers of 815,018 tons. A Norway-Mexican Gulf line of steamers was started in 1907. The company is to receive a subsidy of 100,000 crowns a year for three years, and will maintain regular communication between Norway and certain Gulf ports every six weeks. The first run was made in September, 1907. Two ships, to be launched in the latter part of 1908, were also under construction, and these were intended also to call at Norfolk, Va. In 1908 was organized the Scandinavia-United States direct line. For the present six steamers will be engaged in the service between Norway, Sweden and Denmark, and the United States. The capital for the consolidated line is furnished equally by each of the three countries. They will sail under the Norwegian flag, and Bergen will be the headquarters of the company. The length of railways in 1908 was 1,604 miles, of which about 1,360 belonged to the State; of State telegraph lines in 1907, 6,492 miles. On June 10, 1908, the first passenger trains were despatched on the railway that traverses the great mountain barrier between Bergen, the chief city of western Norway, and Christiania. A part of the eastern link was still unfinished. By 1910 the line is expected to be completed, and will then join the Northern Railway leading into Christiania. The steamer journey between Bergen and Christiania takes at least two days and a half; the railway journey will take twelve hours. The railway passes for 35 miles through regions of almost permanent snow and ice, reaching an altitude of 4,265 feet above sea level. The first exploration work was done in the early seventies, and the decision to build the line was reached by the Government in 1894. In the latter part of 1908 the Storting passed a bill authorizing a number of important lines, the building of which is to extend over a period of twelve years. The plan contemplates the establishment of railway connection between the south and north, between the southeast and northwest, between Christiania and Stavanger, and between Trondhjem and Nordland, the final terminus of the last-mentioned line being a little above the Arctic Circle.

FINANCE. The revenue and expenditure for the year ending March 31, 1906, were 100,081,000 (including 7,417,000 crowns raised by loans) and 98,715,000 crowns respectively. The budget for 1906-7 balanced at 114,209,200 crowns, and for 1907-8 at 105,551,000. For the last-mentioned year the principal sources of revenue were estimated as follows: Income tax, 5,800,000 crowns; customs, 40,000,000; excise on spirits and malt, 7,800,000; railways, 15,598,000; post office and telegraphs, 9,437,000; railway loan, 6,528,000. The principal estimates of expenditure for 1907-8 were: Civil list, 751,000 crowns; worship and education, 11,359,000; justice, 7,744,000; post, telegraphs, etc., 11,284,000; railways, 20,838,000; public works, 4,977,000; public debt, 15,257,000; army, 13,408,000; navy, 4,839,000. The national debt stood on March 31, 1907, at 333,799,000 crowns. The

State assets were 363,600,900 crowns, the railways alone being worth 224,219,000 crowns.

ARMY AND NAVY. The army is a national militia. The line and landvärn aggregate about 75,000 men, but not more than 18,000 can be under arms without the consent of the Storting. The nominal strength of the landstorm and its reserve is 95,000. At the beginning of 1908 the effective strength of the navy was as follows: Four armored coast defense vessels, aggregating 14,720 tons; 2 protected small cruisers, 2,500 tons; 4 gunboats, 1,600 tons; 1 destroyer, 390 tons, and 34 torpedo boats, 2,360 tons, giving a total of 45 ships, of 21,570 tons. The crews numbered 2,506.

GOVERNMENT. King Haakon VII., born August 3, 1872, the second son of King Frederick VIII., of Denmark, was elected king by the Storting on November 18, 1905, accepted the crown on November 20, and landed in Norway on November 25, 1905. The cabinet consisted in 1908 as follows: Premier and Minister of Finance, Gunnar Knudsen; Foreign Affairs, W. Christophersen; Commerce, Navigation, and Industry, Lars Abrahamsen; Defense, naval, Capt. K. F. G. Dawes; Customs, Lt.-Col. H. D. Lowzow; Justice and Police, J. Catsberg; Agriculture, L. K. Fossnaes; Public Works, U. C. Ihlen; Worship and Instruction, K. Seip. In 1907 women were granted the franchise to the Storting on the same conditions as at municipal elections, namely, that they or their husbands have paid an income tax on an annual income of 400 crowns in the towns or 300 crowns in the rural districts.

HISTORY.

PARLIAMENT. M. Michelsen, the Premier, retired on October 28, 1907, and was succeeded by M. Lövland, his Minister of Foreign Affairs, who recruited his cabinet from the moderate Left. M. Michelsen had been a leader of the dissolution movement which culminated in 1905 in the separation of Norway and Sweden. Under him also occurred the adoption of a limited woman's suffrage (June 14, 1907), whereby the same rule was applied to national as had been applied since 1901 to municipal elections. It bestowed the right to vote on women not less than thirty years of age who paid taxes on an annual income of not less than 300 kr. in the country or 400 kr. in cities or whose husbands paid taxes on that amount. The Socialists and the Right were expected to profit from its operation, rather than the Left which was largely a peasant or country party, and whose women voters had more difficulty in gathering at the polls on account of the distances. Important questions before the country and Parliament in 1908 as in previous years were the language question, pertaining to the recognition and cultivation of the *landsmaal* or native speech, the question of national insurance, and the question of the rights of foreign capitalists in waterfalls, mills, and forests. Another important issue was the national organization of the church, the church party claiming its independence of the state authorities. The Storting voted to create a commission, half of its members appointed by the Storting and half by the King, to study this question. The main interest of the session of the Storting which began on January 11, 1908, was the radical change in the status of political parties. There was a division in the Left, which had for many years presented a solid

front as the party of progress and reform and the party that had carried through the dissolution. It was reconstituted under M. Knudsen, former Minister of Finance, the majority of fifty driving out the discordant element and consolidating itself again as the party of progress and reform. M. Knudsen presented a vote of censure declaring that a government which did not derive its support from the Left, or follow the Left's policy, was not entitled to their confidence. The Socialists also brought in a vote of censure. The government having only 60 votes against 53 for Knudsen and 10 Socialists, M. Lövland resigned and was succeeded by M. Knudsen, who gave the radical wing of the Left a fair representation in his cabinet.

FOREIGN AFFAIRS. The text of the treaty of November 2, 1907, was for the first time made public in February, 1908, after receiving the unanimous consent of the Storting. It followed a diplomatic convention with Norway on the part of Great Britain and France abrogating the treaty of November, 1855, by which the two latter Powers had guaranteed the united kingdom of Sweden and Norway against Russian aggression. The new treaty signed with Norway by the four great Powers of the North Sea, Germany, France, Great Britain, and Russia recited that the contracting Powers were "animated by a desire to assure to Norway, in her actual limits and with her neutral zone, her independence and her territorial integrity, as well as the benefits of peace." By Article I. the Norwegian government agreed "not to cede to any Power either by title of occupation or by any other title any part of her territory." By Article II. the German, French, British, and Russian governments "recognize and bind themselves to respect the integrity of Norway. If the integrity of Norway is menaced or impaired by any Power, the aforesaid governments bind themselves, after a preliminary communication to that effect from the Norwegian government, to lend their support by such means as are judged the most appropriate in order to safeguard the integrity of Norway." The term of the treaty was ten years.

NOVA SCOTIA. A maritime province of Canada. Area, 21,248 square miles. Population in 1901, 459,574. Halifax, the capital, had 40,832 inhabitants in 1901. For details respecting population, education, production, commerce, etc., see CANADA. The provincial government consists of a Lieutenant-Governor, appointed by the Governor-General of Canada, and acting through an executive council, or responsible ministry, and a legislature consisting of a legislative council of 21 appointed members and a house of assembly of 38 elective members. The present Lieutenant-Governor is Duncan Cameron Fraser, appointed March 27, 1906. The present Premier is George H. Murray.

HISTORY. By far the most noteworthy event in 1908 was the celebration at Halifax, on August 19, of the opening of the first Parliament of Nova Scotia one hundred and fifty years ago, on October 2, 1758. The Lieutenant-Governor, Hon. Mr. Fraser, Chief Justice Townshend, Hon. W. A. Weir, Mr. Justice Drysdale, and other prominent persons delivered addresses. A tablet was unveiled in the historic Province Building. In addition to the local regiment, a guard of honor from the German cruiser *Fregat* took part in the proceedings. The inscription

on the tablet was in part: "1759-1908. This tablet is to commemorate the convening of the first General Assembly of Nova Scotia, which met for the despatch of business at the Court House, Halifax, on October 2, 1758, in the time of his Excellency, Charles Lawrence Esq., Captain-General and Governor-in-Chief in and over the Province of Nova Scotia." It was recalled that when this parliament met the old Province of Canada, which included what is now Ontario and Quebec, was under French rule. The Liberal government of Premier Murray retains the confidence of the people.

NOVI BAZAR. See BALKAN QUESTION.

NOYES, CROSBY STUART. An American journalist, editor-in-chief of the *Washington Evening Star*, died on February 21, 1908. He was born at Minot, Me., on February 16, 1825, and was a graduate of Bowdoin College. His first newspaper work was in Maine, where from time to time he contributed short articles to the newspapers. In 1847 he went to Washington, and the year following became connected with the *Washington News* and also acted as correspondent for Philadelphia and Boston papers. With the exception of the year 1855, when he crossed the continent on foot, contributing special articles to the *Portland Transcript*, the remainder of his newspaper career was passed in Washington. He was especially known for the work he did for the *Washington Star* during the Civil War, the close relations he had established with many of the men then in public life, and with some of the department heads, aiding him greatly in obtaining authentic information. Two years after the war he and other Washington correspondents bought the *Star*, and he was made editor-in-chief of the reorganized paper, which was named the *Evening Star*.

NUTRITION STUDIES. See FOOD AND NUTRITION.

NYASSALAND PROTECTORATE.

A British possession in the eastern part of Central Africa, known until July 6, 1907, as the British Central Africa Protectorate. Area, 40,980 square miles; population (1907), estimated at 948,270 (587 Europeans and 515 Asiatics). Zomba, on Lake Nyassa, is the seat of administration. Blantyre has over 6,000 inhabitants (200 Europeans). The agricultural products include rice, cotton, tobacco, coffee, and tea. Wheat has been recently introduced. Oats and barley grow well on the highlands. The acreage of cotton under European cultivation in 1907-8 was 8,659, and the exports of cotton was 403,486 pounds, valued at £13,999; against 7,017 acres, and an export of 526,119 pounds, valued at £15,345, in 1906-7. The crop of 1907-8 was poor, owing to drought in the uplands and excessive rain in the lowlands. The native crop of cotton in 1907-8 was 24½ tons, approximately one-third of that produced in the two preceding years. The cultivation of tea is confined to the Mlanje district, where the soil and climate are especially favorable. In 1907-8 tea covered 516 acres, yielding 2½ tons. For 1908-9 the tea crop was estimated at 9½ tons. The quality has improved in the last three years, owing to the greater maturity of the bushes. Planters do not eagerly take up tea cultivation, as it requires a large capital and five or six years have to elapse before there are any returns on the investment. But it is stated that

in Nyassaland tea can be produced at less cost than in India or Ceylon. The imports for consumption and exports of colonial produce in 1907-8 amounted to £169,541 and £68,604 respectively. The imports are mainly cotton goods, hardware, and provisions; the exports, coffee, tea, cotton, tobacco, ground nuts, rubber, and chillies. A railway from Port Herald to Blantyre, 113 miles long, was opened on March 31, 1906. It will probably be extended to Lake Nyassa by way of Zomba. On Lake Nyassa there are eight steamers. The length of telegraph line is over 780 miles. The Governor in 1908 was Sir Alfred Sharpe.

OATS. The annual crop statistics published by the Department of Agriculture showed that in 1908 32,344,000 acres of oats were grown which produced a total yield of 807,156,000 bushels, the average yield per acre being 25 bushels. As compared with 1907 this shows an increase of 1,507,000 acres in area and of 52,713,000 bushels in total production. The average yield for 1908 was also better by 1.3 bushels per acre. In total value of crop oats ranked fifth and as usual next to wheat, the amount being \$381,171,000, which had never been exceeded. The year's yield was surpassed in 6 different seasons since 1895, when the yield was 824,443,000 bushels. Iowa, the leading State in oat production in 1908, produced 110,444,000 bushels on 4,545,000 acres, the average acre yield being 24.3 bushels. The total crop of the State on December 1 was worth on the farm \$46,386,000. The States ranking next were Illinois with 4,100,000 acres and 94,300,000 bushels, Wisconsin with 2,350,000 acres and 73,085,000 bushels, Minnesota with 2,682,000 acres and 59,004,000 bushels, and Nebraska with 2,549,000 acres and 56,078,000 bushels. All other States produced less than 50 million bushels. These 5 States produced about 36 per cent. of the total crop for the year.

The world's oats production in 1907 amounted to 3,582,041,000 bushels. Of this quantity European Russia furnished 820,621,000 bushels, Germany 630,324,000 bushels, France 314,132,000 bushels, Austria-Hungary 257,172,000 bushels, Canada 210,869,000 bushels and the United Kingdom 198,718,000 bushels. All other countries produced less than 100,000,000 bushels.

While it is possible to raise as high as 90 to 100 bushels of oats per acre the average yield for the entire country in 1908 was only 25 bushels and for the leading States it ranged from 22 bushels in Minnesota and Nebraska to 31.1 bushels in Wisconsin. It would seem then that there was room for improvement and ways and means for bringing this about were outlined by Prof. M. L. Bowman of the Iowa Agricultural College in a paper presented at the National Corn Exposition at Omaha. It was pointed out in this paper that no No. 1 oats are received at our leading markets, only 0.2 per cent. of No. 2 oats, 2 per cent. of standard, 54 per cent. of No. 3, and 40 per cent. of No. 4; or that 94 per cent. of the oats marketed belong to the low grades. Basing the discussion largely on results secured at the Iowa experiment station, Prof. Bowman showed how different factors may influence quality and yield. The variety grown must be adapted to the locality. At the Iowa station the average yields of 20 varieties grown for 3 years varied from 26.2 to 62.5 bushels and the tests on the whole showed that

Silvermine, Kherson, and Swedish Select were best adapted to the locality. Attention was called to the fact that Prof. Zavitz's work in Canada resulted in a yield of 65.5 bushels per acre from large plump seed and only 44.7 bushels from light seed and that the weight per bushel was 35.5 and 24.3 lbs. respectively. This is mentioned as an argument for cleaning and screening the oats before seeding. Formalin treatment reduced smut to 0.6 per cent., as compared with 7.9 per cent. of smut in the untreated crop. The rate of seeding should be heavier for large than for small seed as the number of seeds per bushel varies greatly. Kherson oats before fanning contained 1,054,600 grains per bushel and after fanning three times only 830,600 grains, while for Silvermine the corresponding figures were 1,038,200 and 806,300. Drilling is recommended as much more profitable than sowing broadcast. A closer grading of oats on the primary market would tend toward the production of a staple higher in quality. It was observed that Red Texas oats when grown in Kansas for several years becomes badly mixed with grains having black chaff. Investigation by the Kansas experiment station indicated that the black oats was an admixture to the seed of the Red Texas, and that it is inferior to it in quality.

OBERLIN COLLEGE. An institution of higher learning at Oberlin, Ohio, founded in 1833. The attendance during the year 1908-9 is 1940; of this number 874 are in the College of Arts and Sciences, 560 in the Conservatory, and 47 in the Theological Seminary. During the past year two important new buildings have been completed, the Finney Memorial Chapel, seating 1,980, and the Carnegie Library. The Chapel was erected at a cost of \$135,000, and the Library, at a cost of \$155,000. Temporarily the Olney Art Collection occupies quarters in the Library. Funds are being raised for the erection of a new Art Building and of a Men's Building. A Chapter of Phi Beta Kappa was established last year. The endowment is \$1,700,000. The total assets including endowments, buildings, and grounds are \$3,540,000. Henry Churchill King is President.

O'CONOR, Sir NICHOLAS RODERICK. An English diplomat, died on March 19, 1908. He was born in Dundermott, County Roscommon, Ireland, on July 3, 1843, was educated at Stonyhurst and at Munich, and entered the diplomatic service in 1866. From 1870 to 1886 he served at Washington, Madrid, Rio de Janeiro, Paris, and Peking; he was political agent and consul-general at Bulgaria in 1886-92; minister at Peking in 1892-96; ambassador at St. Petersburg in 1895-98; and, after 1898, ambassador at Constantinople, where he died. During his consul-generalship at Sofia, he negotiated the important Anglo-Bulgarian commercial agreement, despite the greatly disturbed condition of the country following the abdication of Prince Alexander (1886), while as minister to China his firmness and fearlessness greatly improved conditions there so far as they affected Englishmen in particular, and foreigners in general. At St. Petersburg his relations with Count Muravieff became so strained in consequence of what O'Connor considered acts of bad faith on the part of the Russian government that, though his own government approved of his stand, he was transferred to Constantinople,

where his service was in the main successful, despite the profound distrust of Great Britain felt by the Ottoman government.

OHIO. One of the North Central States of the United States. Its area is 41,040 square miles. The population according to a Federal estimate made in 1908 was 4,545,719.

MINERAL RESOURCES. The mineral production of Ohio is surpassed only by that of Pennsylvania among the States. In 1907 the aggregate value of mineral products amounted to \$207,657,339, a decrease of \$2,319,591 over the preceding year. Of this production, pig iron amounted to 5,250,687 long tons, as compared with 5,327,133 long tons in 1906, and 4,586,110 long tons in 1905. There were on January 1, 1908, 68 blast furnaces for the production of pig iron in the State. There was a considerable increase in the production of coal in 1907 over the production of 1906. In the former year 32,142,416 short tons were produced, valued at \$35,324,746. This was an increase of 4,410,779 short tons, or 15.91 per cent. in quantity and of \$4,978,166 or 16.4 per cent. in value over the production of 1906. The industry in Ohio was not affected by labor troubles or strikes of any consequence during 1907. Mining was interrupted for a short time in the Hocking Valley district by disastrous floods, but this interruption did not result in serious loss to the mines. There were employed in the mines of the State in 1907 46,833 men, as compared with 45,438 in 1906. Ohio leads all the other coal producing States in the percentage of the total product mined by the use of machines. In 1907 there were 1,328 coal mining machines in use, as compared with 1,255 machines in 1906. There were 153 men killed in the mines of Ohio during 1907. There has been an increase in the value of coke produced in the State in the past five years, although the production fell from 293,994 short tons in 1906 to 270,634 short tons in 1907, while the value of the production fell from \$1,013,248 to \$819,262 in 1907. Ohio ranks first among the State in the value of clay products. In 1907 these products were valued at \$30,340,830, which was a decrease from the figures of 1906, which were \$31,014,165. Ohio ranks fifth among the States in the production of petroleum. There were produced in 1907, 12,207,448 barrels, a considerable decrease from the production of 1906, which was 14,787,763 barrels. Ohio ranked first in the value of its petroleum production in 1906, but in 1907 had fallen to fifth place, being surpassed by the Oklahoma-Kansas field, Pennsylvania, Illinois, and West Virginia. The value of the product of 1907 was \$14,769,858, as compared with a value of the product for 1906 of \$16,997,000. In the production of salt Ohio ranks third, being surpassed only by New York and Michigan. In 1907 there were produced 3,851,243 barrels, valued at \$979,078, as compared with a production of 3,236,875 barrels in 1906, valued at \$789,237. There were produced in 1907 1,151,176 barrels of Portland cement, valued at \$1,377,155, as compared with 1,422,901 barrels in 1906 with a value of \$1,709,918. Ohio produces over six-sevenths of the grindstones and pulp stones of the country. Other important mineral products are coal products, building stone, sand and gravel, oilstones and whetstones, iron ores, pyrite, bromide, gypsum, natural cement, and metallic paint. It is estimated that the coal ton-

nage of the State in 1908 was about 15 per cent. less than that for 1907. The coal market of 1908 was affected during the earlier part of the year by the uncertainty of manufacturers as to conditions following the panic. The State had less mining trouble in 1908 than for several years past. The remarkably dry season had no appreciable effect on the industry, other than that seen in the additional cost due to the necessity of hauling water, and the temporary closing of a few mines.

AGRICULTURE AND STOCK RAISING. The acreage, production, and value of the principal farm crops in 1908, according to the United States Department of Agriculture, were as follows: Corn, 136,675,000 bushels, valued at \$86,105,000 from 3,550,000 acres; winter wheat, 33,328,000 bushels, valued at \$32,995,000 from 2,083,000 acres; oats, 38,554,000 bushels, valued at \$18,887,000 from 1,460,000 acres; barley, 825,000 bushels, valued at \$528,000 from 30,000 acres; rye, 808,000 bushels, valued at \$614,000, from 49,000 acres; buckwheat, 24,000 bushels, valued at \$197,000 from 13,000 acres; potatoes, 13,090,000 bushels, valued at \$10,079,000 from 170,000 acres; hay, 4,590,000 tons, valued at \$39,933,000 from 3,000,000 acres; tobacco, 33,768,000 pounds, valued at \$3,545,640 from 50,400 acres. The State ranks seventh in the production of corn. The corn crop of 1908 showed a considerable increase over that of 1907, which was 117,640,000 bushels. The production of wheat also showed an increase over the crop of 1907, which was 30,677,000 bushels. The oat production showed a considerable decrease from that of 1907, figures for the latter year being 36,480,000 bushels. The tobacco production showed a decrease in 1908 of nearly 50 per cent. from that of 1907, the figures for the former year being 60,480,000 pounds. The farm animals on Jan. 1, 1909 were estimated to number as follows: Horses, 958,000; mules, 21,000; dairy cows, 947,000; other cattle, 998,000; sheep, 3,110,000; swine, 2,380,000. The wool clipped in 1908 was estimated at 2,000,000 pounds valued at \$3,182,400.

MANUFACTURES. Very substantial progress was made in manufacturing from 1900 to 1905. Limiting the comparison to industries carried on in factories, there was an increase of 50 per cent. in capital, of 18.2 per cent. in the number of wage-earners, and of 28.3 per cent. in the value of products. The figures in 1905 were: Capital, \$570,908,900; wage-earners, 364,298; and value of products, \$960,811,800. This latter sum was exceeded by only four States. Of the wage-earners, 55,375 were women, and 5095 were children under 16. The values due to leading industries, and the percentage increase in value over 1900 (in parentheses), were: Iron and steel, \$152,859,100 (10); foundry and machine shop products, \$94,507,600 (30.5); flour and grist mill products, \$40,855,600 (16.5); slaughtering and meat packing, \$28,729,000 (34.5); boots and shoes, \$25,140,000 (40.3); liquors, malt, \$21,620,800 (19); and distilled, \$15,976,500 (28.4); railway repair shops, \$21,428,000 (65.1); clothing, men's, \$18,496,000 (11.5), and women's, \$12,803,500 (64.7); printing and publishing, newspapers and periodicals, \$15,963,600 (34.6), and book and job, \$11,530,900 (45.2); planing mills, \$17,725,700 (60.2); carriages and wagons, \$16,096,000 (3); rubber and elastic goods, \$15,963,000 (117.8); furniture, \$13,322,-

600 (40); cigars and cigarettes, \$13,241,000 (17.8); agricultural implements, \$12,891,000 (7.8); lumber and timber products, \$12,568,000 (36 per cent. decrease). Slightly less values were represented by electrical apparatus and supplies, soap and candles, paper and wood pulp, refining petroleum, roasting and grinding coffee and spices, glass, and structural ironwork. (For pig iron and clay products, see paragraph *Mineral Resources*.) Ohio easily ranks next to Pennsylvania in the iron and steel industry. The production of all kinds of rolled iron and steel amounted to 2,737,497 tons in 1900, 3,481,178 tons in 1904, 2,302,142 tons in 1905, and 2,979,367 tons in 1906.

EDUCATION. The report of the State Commissioner of Common Schools for 1908 shows that there were in the fiscal year ending June 30, 1908, 69 city districts, 1,207 village and special districts, and 1327 township districts. There were in the State 1,253,805 persons of school age (6 to 21). The total number enrolled in the public schools was 859,774, of whom 791,343 were in elementary schools and 68,341 in high schools. The average daily attendance was 604,092. There were 960 high schools in the State, of which 324 were first grade, 278 second grade, and 358 third grade. In the first grade schools courses of four years of 32 weeks each are offered; in the second grade, 3 years of 32 weeks each; and in the third grade, 2 years of not less than 28 weeks each. The total receipts for school purposes were \$25,987,020. Of this sum, \$19,327,580 was derived from local taxes, \$2,150,048 from the State taxes, and \$2,363,333 from the sale of bonds. The total expenditures for the year were \$24,695,157. There were employed 26,999 teachers, of whom 2,690 were in high schools. The average monthly salary of men teachers in elementary schools in township districts was \$44, and of women \$43; of men in elementary schools in other districts, \$55, and of women, \$45. There were in the State 31 colleges and universities, and 23 academies and preparatory schools, 8 normal schools, 4 theological seminaries, and 20 professional schools.

FINANCE. The report of the State Treasurer for the fiscal year ending Nov. 15, 1907, showed a balance on Nov. 16, 1906, of \$3,746,033. The receipts for the fiscal year ending Nov. 15, 1907, were \$10,891,439 and the disbursements, \$9,555,621, leaving a balance on Nov. 15, 1907, of \$5,081,850. The receipts were: From the general revenue fund, \$7,767,027; from the sinking fund, \$341,675; from the school fund, \$2,236,649; and from the university fund, \$546,086. The taxes received from the counties of the State amounted to \$2,441,369; the receipts from liquor traffic taxes amounted to \$2,751,023. The State tax levy of 1907 was 1.345 mills.

POLITICS AND GOVERNMENT. The year 1908 was one of the most stirring, politically, in the history of the State. The fact that the Republican nominee for the presidency was one of her sons would, under normal conditions, presuppose an almost unanimous support for his election in that party in the State. In Ohio, however, the situation was complicated by the strong and bitter opposition to Judge Taft as a candidate by both the United States Senators, J. B. Foraker and Charles P. Dick, but especially by the former, who had a powerful influence in the Republican "machine" of the

State. The opposition to Judge Taft on the part of Senator Foraker became active as early as Mar., 1907, when the former formally announced his candidacy. Senator Foraker at once began a fight to secure delegates to the State and National Conventions who should be opposed to Judge Taft, and on Mar. 26, 1907, he announced that he would call a primary election early in 1908. On Dec. 9, 1907, he sent a request to the Chairman of the Republican State Convention to that effect. Between those two dates he was industrious in stirring up opposition throughout the State. He received and accepted the indorsement of the State League of Republican Clubs for the presidency, and thus became himself an active candidate.

Senator Foraker had been perhaps the most active opponent in the Senate to the policies of President Roosevelt, and it was no secret that the President had no sympathy with his attempts to stir up strife in Ohio. Senator Foraker, on his side, carried on his campaign with the avowed purpose of discrediting certain policies of the President. These policies had the hearty support of Judge Taft, and on this was based, to a large degree, the burden of Senator Foraker's opposition, though there was also at issue his continued control of the State machine. On Jan. 2, the Republican State Central Committee issued a call for State Convention primaries on Feb. 11. Senator Foraker objected to certain conditions to be observed in these primaries, and declared that he would not be bound by the results. He continued his fight against President Roosevelt and Judge Taft by securing the rejection on Jan. 14, by the Senate, of the nominations of four postmasters, whose appointment, he alleged, was due to promises to support Judge Taft's candidacy. An attempt was made to have the Bronson primary election law, under which the call for elections had been issued, declared unconstitutional, but the Supreme Court on Jan. 28 denied the petition for an injunction restraining the State Committee from issuing the call. Senator Foraker instructed his supporters to ignore the primaries.

The result of the elections was a complete and decisive victory for the Taft forces. Delegates pledged to Judge Taft were elected from nearly every county in the State where primaries were held; in the other counties election boards certified to the State Convention lists of delegates of the Taft managers as elected without opposition. The result made the action of the State Convention little more than a formality, and when that body assembled on Mar. 3 the Taft-Roosevelt forces were in complete control. Delegates at large were instructed to vote for Judge Taft for President without a dissenting vote. The platform adopted contained planks calling for government regulation of railways as against government ownership, the re-enactment of the Employers' Liability Law, a limitation of the power of injunction, a greater merchant marine, and the speedy completion of the Panama Canal. For the first time a full State ticket was nominated, by acclamation, under the biennial election amendment.

The dissensions among the Republican leaders of the State gave the Democrats an opportunity of which they did not fail to take advantage. At

their State Convention held at Columbus on May. 6, Judson Harmon, Attorney-General under President Cleveland, one of the strongest Democrats in the country, was nominated for Governor. This result was not accomplished without strong opposition, led by Tom L. Johnson, mayor of Cleveland. The delegates to the National Convention were instructed to vote for W. J. Bryan.

The situation in Ohio was considered so critical from the Republican standpoint that it was decided formally to begin the campaign in that State and the opening speech was made by Governor Hughes of New York at Youngstown on Sept. 5. The campaign was fought throughout with great activity on both sides. The most important features, which were more than local in their character, will be found discussed in the article **PRESIDENTIAL CAMPAIGN**. The result of the election on Nov. 3 was another of the remarkable evidences of the development of independent voting throughout the country. W. H. Taft received a plurality of nearly 69,591 votes over W. J. Bryan, but Judson Harmon, the Democratic nominee, was elected over Governor Harris by 19,372 plurality. See **FORAKER, J. B.; PRESIDENTIAL CAMPAIGN**.

The detailed results of the vote for the National and State tickets were as follows: Taft, 572,312; Bryan, 502,721; Debs, 32,795; Chafin, 11,402; Hisgen, 430; Watson, 162; Gilhaus, 721; Harmon, 552,569; Harris, 533,197. Directly following the election active campaigns were begun for the Senatorial nomination for a successor to Senator Foraker. The leading candidates were Theodore E. Burton, a Representative in Congress, Charles P. Taft, a half-brother of W. H. Taft, and Senator Foraker, to succeed himself. Both Mr. Burton and Mr. Taft showed great strength, but late in December the latter withdrew from the contest declaring that he did so for the best interests of the Republican party. Senator Foraker also withdrew, thus leaving Mr. Burton the only strong candidate in the field.

An amendment to permit the Legislature so to modify the present laws regarding taxation as to bring them into harmony with modern developments in industry and finance was defeated at the polls in the November election.

Under the local option law passed by the legislature of 1908 (see paragraph below and **PROHIBITION**) elections were held in various counties of the State in the later months of the year. The general results were large gains for no license.

OTHER EVENTS. A discussion of the efforts of Tom L. Johnson, mayor of Cleveland, to establish a municipal street railway system, with three-cent fares, will be found in the article **JOHNSON, TOM. L.** On Feb. 4, officials of ice companies in Toledo were sentenced to serve three months in the county jail, and to pay costs of prosecution for conspiracy in restraint of trade. On April 3, twenty lumbermen of Toledo were found guilty of conspiracy in restraint of trade under the Valentine Anti-trust Law. They were fined from \$500 to \$1,000 apiece. In February the State suffered from aggressions of "night riders" in Clermont county, and it was found necessary to call out troops for the protection of tobacco growers. On May 5 troops were again employed to stop outrages of "night riders" from Kentucky in the same

district. On Mar. 4, in the burning of the Lake View School at Collingwood, a suburb of Cleveland, 161 children and teachers lost their lives. Fires in Cleveland on Feb. 2 caused a loss of about \$200,000. The mechanical plant of the Cleveland *Plain Dealer* was destroyed. A monument to the late Senator Marcus A. Hanna was dedicated in Cleveland on May 22. The dedicatory address was made by Vice-President Fairbanks, and William H. Taft was present.

LEGISLATION. Among the important acts passed at the legislative session of 1908 were those mentioned below: The Pure Food Law was amended to provide against the misbranding of foods and drugs, and penalties were provided for its infraction. A law was passed authorizing the appointment of a State Board of Health, consisting of eight members, seven of whom shall be appointed by the Governor. This Board has supervision of all matters relating to the preservation of the life and health of the people and has supreme authority in matters of quarantine. An act was also passed to establish a Bureau of Vital Statistics which provides for the prompt and permanent registration of all birth, and deaths occurring within the State. Measures were passed providing for the organization, regulation, and inspection of building and loan associations and savings associations. The laws relating to elections were amended. Corporations were forbidden to contribute to political parties, committees, or organizations, or to use their money in any way for any political purpose whatever. A measure was passed authorizing 35 per cent. of the qualifying electors of any county to petition the commissioners or any judge of the county for the privilege of determining by ballot whether the sale of intoxicating liquors shall be prohibited within the limits of the county (local option). It was provided that all expenses of general or special elections arising from printing and distributing ballots, cards of explanation to the officers of the election and voters, and all other proper and necessary expenses shall be paid out of the county treasury. An act was passed regulating the conducting of primary elections. Laws relating to franchises were amended to provide for the written consent of more than one-half the property owners before the construction of street railway tracks. Laws relating to political elections were amended.

STATE OFFICERS: Governor, Andrew L. Harris; Secretary of State, Corwin A. Thompson; Treasurer, W. S. McKinnon; Auditor, W. D. Guilbert; Commissioner of Education, Edmond A. Jones; Attorney-General, Wade H. Ellis; Adjutant-General, A. B. Critchfield; Commissioner of Insurance, S. J. Vorys—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, James L. Price; Associate Justices, A. N. Summers, W. B. Crew, John A. Shauck, William Z. Davis, William T. Spear; Clerk, Joseph G. Obermeyer—all Republicans.

The State Legislature of 1908 was composed of 20 Republicans and 14 Democrats in the Senate, and 71 Republicans and 45 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES, under the section *Congress*.

OKLAHOMA. One of the South Central States of the United States, formed in 1907 by the union of Oklahoma and Indian Terri-

tories. Its area is 70,057 square miles. The population, according to Federal estimate in 1908, was 1,503,289.

MINERAL RESOURCES. The most notable feature in the development of the mineral resources of Oklahoma has been the enormous development of the petroleum fields. The Oklahoma-Kansas field, which includes the two States mentioned, rose from fourth place in production in 1906 to first in 1907. In the latter year this field produced 45,933,649 barrels of petroleum, of which the production of Oklahoma is estimated by the United States Geological Survey at 44,300,149 barrels. The value of the product in 1907 was \$18,478,658, of which the oil produced in Oklahoma is estimated to be valued at \$17,824,342. Large developments were carried on throughout the State in 1907. Several large pipe lines were constructed and many wells were sunk. The area of the coal production of Oklahoma is co-ordinate with the territory known until 1906 as Indian Territory. The output shows a notable increase in 1907 over the production of 1906. The figures for the former year were 3,642,658 short tons, with a spot value of \$7,433,914. This is an increase of 782,458 tons, or 27.36 per cent. in quantity, and \$1,951,458 or 35.6 per cent. in value. Only three States, Michigan, Arkansas, and New Mexico showed a greater percentage of increase in 1907 over 1906 than Oklahoma. The number of men employed in the coal mines in 1907 was 8398. There were killed in the mines of the State in 1907 33 men. There were produced in 1907 19,089 short tons of coke, a great decrease from the production of 1906, which was 49,782 short tons. The clay products of the State were valued in 1907 at \$664,512 as compared with a value of \$540,901 in 1906. In the latter figure the value of the production of Indian Territory is included. Among other mineral products of the State are coal products, gypsum, lime, mineral waters, salt, stone, sand and gravel. According to figures by the United States Geological Survey, from whose reports the figures given above are taken, the value of the total mineral production of the State in 1907 was \$26,908,968 as compared with a value in 1906 of \$16,826,686.

It is estimated that the production of coal in 1908 decreased about 25 per cent., as compared with the production in 1907. One of the main causes in the decrease in coal consumption was the increase in the use of oil and natural gas throughout the State. This is considered to be responsible for at least 8 per cent. of the decrease in the production of coal.

MANUFACTURES. There has been rapid industrial growth in the State in the past few years. In 1900 there was \$2,462,000 of capital invested in manufacturing establishments employing 1,294 wage-earners and having an output of products valued at \$5,504,800; in 1905 this had grown to \$11,107,700 of investment, 3199 employees and products of the value of \$16,549,600; and in Sept., 1908, the State Commissioner of Labor reports 650 manufacturing establishments with an approximate output of \$25,000,000 per annum, representing an investment of over \$16,000,000, employing 11,500 people, and having an annual pay roll of \$3,350,000. The leading industry is flour and grist milling, the 78 mills of the State representing an investment of \$3,500,000, and turning out

products valued at \$11,000,000 per annum. The second important industry is the manufacture of cottonseed oil and other products of cottonseed. Thirty-seven cottonseed oil mills in the State turned out products of the value of \$4,697,000 during 1908, showing an increase of 209 per cent. in two years. Eleven plaster mills in operation the past year have turned out gypsum plaster to the value of \$4,250,000; printing and publishing houses report products of \$1,500,000 value; and pressed brick plants nearly a million dollars' worth of building and paving brick. The first cotton spinning plant in the State established at Guthrie in 1907, with an investment of \$200,000 in the plant employs 150 people, and turned out \$350,000 in finished product and netted dividends of nearly 20 per cent. for the stockholders the first year. Large Portland cement mills are going in at Dewey and Ada and with an abundance of limestone and shale and inexhaustible supplies of natural gas for fuel this is destined to be one of the important industries of the State. With oil, gas and coal unlimited, and deposits of all kinds of clays, cements, glass sand, gypsum, asphalt, salt, lead, iron and zinc practically inexhaustible, Oklahoma is destined to become one of the great manufacturing States of the nation.

AGRICULTURE. The acreage, production, and value of the farm crops of the State in 1908 were as follows, according to statistics of the United States Department of Agriculture: Corn, 122,239 bushels, valued at \$62,342,000 from 4,929,000 acres; winter wheat, 15,625,000 bushels, valued from \$13,750,000 from 347,000 acres; oats, 11,250,000 bushels, valued at \$5,062,000 from 450,000 acres; barley, 690,000 bushels, valued at \$400,000 from 30,000 acres; rye, 40,000 bushels, valued at \$32,000 from 3,000 acres; flax, 36,000 bushels, valued at \$40,000 from 6,000 acres; potatoes, 2,106,000 bushels, valued at \$2,064,000 from 27,000 acres; hay, 1,305,000 tons, valued at \$6,525,000 from 900,000 acres. In the production of winter wheat Oklahoma ranked seventh in 1908. The production of corn in 1908 showed a considerable increase over that of 1907, which was 113,265,000 bushels; wheat, too, showed a decided increase over the production in 1907, which was 8,631,000 bushels, or an increase of nearly 50 per cent. The hay crop increased from 470,000 tons in 1907 to 305,000 tons in 1908, while the acreage increased from 392,000 to 900,000. It may be said that all crops in 1908 showed an increase over 1907. Broom corn and Kaffir corn are extensively grown. Fruit cultivation has increased notably in the last few years. The number of farm animals in the State on Jan. 1, 1909, was as follows: Horses, 781,000; mules, 185,000; dairy cows, 338,000; other cattle, 760,000; sheep, 102,000; swine, 1,588,000. The value of the wool clipped in 1908 was estimated at \$71,808.

EDUCATION. The first report of the State Department of Education shows that there were in Oklahoma in 1908, 7,500 organized school districts with 7,500 school-houses, valued at \$7,500,000. The school population (5 to 21 years) was 500,000. The average enrollment was 400,000 and the average attendance, 350,000. There were enrolled in the high schools of the State 10,000 pupils, with 550 teachers; in the common schools, 10,000 teachers; and in the State schools, 350. The average length of

the school term was 120 days. The total expenditure for public schools during the year was \$3,000,000. The following were the institutions under direct State control, with the numbers enrolled in each: State University, Norman, 790; Central Normal School, 1146; Northwestern Normal School, Alva, 870; Southwestern, Weatherford, 661; A. & M. College, Stillwater, 1008; Colored A. & N. University, Lawton, 405; University Preparatory School, Tonkawa, 515; Murray Agricultural High School, Tishomingo, about 150. Connors Agricultural High School at Warner was opened Jan. 1, 1908. The total value of land and equipments of these seven State institutions was \$2,023,100.

FINANCE. The first annual report of the State Treasurer of Oklahoma for the fiscal year commencing Nov. 16, 1907, and ending Nov. 30, 1908, shows receipts during that period of \$251,045 and expenditures of \$218,920, leaving a balance on Nov. 30, 1908, of \$32,124. The chief receipts were from the general revenue fund, \$196,116; common school fund, \$398,362; public building fund, \$75,600; and common school indemnity, \$23,811.

CHARITIES AND CORRECTIONS. The Legislature of 1907 did not establish any correctional institutions, but only provided for temporary, eleemosynary, and penal institutions. A temporary school for educating deaf mutes was established in 1908 and it was opened in September with an enrollment of 123 pupils. An appropriation of \$50,000 was made for a temporary school for the blind and such an institution was opened at Fort Gibson. The Whitaker Orphans' Home at Prior Creek was given to the State by its founder, W. T. Whitaker in 1908 and is now a State institution. It has a population of 72 boys and girls. The legislature appropriated \$30,000 for its maintenance and for building an additional cottage to bring the capacity of the institution up to 150 inmates. The State has accepted the Fort Supply Military Reservation with its buildings and 1760 acres of land, and it is now called the Oklahoma Hospital for the Insane, having a population of 501. 450 of its patients were transferred from the Norman Sanitarium. That institution had, in the latter part of 1908, 387 inmates. The Legislature of 1907 passed a bill providing for the building of a penitentiary at McAlester and an appropriation of \$50,000 was made to defray the expenses of bringing convicts back from the Lansing and Leavenworth (Kansas) penitentiaries, also from the Atlanta (Georgia) Penitentiary. The Lansing Penitentiary had, in Sept., 1908, 575 Oklahoma convicts, and on the same date the Leavenworth Penitentiary had 378, and the Atlanta Penitentiary 43. The Legislature made no appropriation for building and equipping the penitentiary, leaving this for the next Legislature to do. A reformatory bill, drafted by Dr. Samuel J. Barrows, President of the International Prison Congress, was introduced in the Legislature of 1907 and passed the Senate but was not pressed in the House. The bill provides for an unqualified, indeterminate sentence and parole. It will be introduced again in the Legislature of 1909. There are, in the institutions for the insane and in the poorhouses of the State, 163 feeble-minded persons. A bill for the establishment of an institution for the feeble-minded will be intro-

duced in the next Legislature. An effort will be made also to establish an institution for epileptics, of which there are 98 in the institutions for the insane.

POLITICS AND GOVERNMENT. The first Legislative session of the State, which began in Dec., 1907, did not end until May 26, 1908. Among the important measures passed was the dispensary bill, authorized by the State constitution. This act provides for a State agency in charge of a superintendent, appointed by the Governor, and local agencies in every town of over 2,000 inhabitants. These agencies are required to keep a strict account of liquors sold and are not to sell without a physician's prescription. Strict limitations are placed on the use of liquors and the evasion of the law by clubs is provided against. Heavy penalties are provided for the infraction of the law. The passage of the measure was strongly opposed, but it was indorsed by the Prohibition party and had the support of Governor Haskell. The State dispensary system was abolished by a vote at the election of Nov. 3 and Governor Haskell issued a proclamation declaring it abolished on Dec. 3. Residents in Oklahoma have now no lawful means of purchasing liquor even for medicinal purposes. The Governor ruled that pharmacists may purchase alcohol for medicinal preparations. A recent opinion of the Oklahoma Supreme Court, by Justice R. L. Williams, holds that the vote of the people in November did not abolish the dispensary system except in so far as that system had been made operative in towns of less than 2,000 population and county seats regardless of population. The State question submitted in November combined a legislative act with a constitutional amendment proposal. The legislative act proposed the State agency and machinery, and the constitutional amendment proposed that agencies should be established in towns of less than 2,000 population as provided by the constitution. The Supreme Court held the constitutional amendment defeated but the remainder of the law in force. Governor Haskell, prior to the issuance of the opinion, issued a proclamation declaring the State Dispensary defeated on the ground that it did not receive a majority of all votes cast on that question. He refused to reopen the State agency, but held that pharmacists may purchase alcohol of the State agency which has been retained in operation. A bill was passed putting a tax on all incomes of more than \$3,500 a year, and a graduated tax on all land holdings of more than 640 acres. Measures were enacted providing an inheritance tax; prohibiting overcharges by agents of railroads, express, telephone and telegraph companies; providing for the nomination of Presidential electors by primaries; prohibiting the sale of mineral lands prior to 1905; and for jury trials in Supreme Court cases. An anti-trust bill, passed by both houses, was vetoed by Governor Haskell. On April 13, the United States Supreme Court affirmed the decision of the Supreme Court of the State in holding the Gulf Express Company a combination in restraint of trade, and ruling that a lease made by it with the Shawnee Compress Company of Shawnee, Oklahoma, was void, as against public policy and the Sherman anti-trust law. On April 28 the Attorney General began suit against railroad companies passing through the State to stop liquor shipments over

their lines. The bank guaranty law of the State was held by Attorney General Bonaparte, on Aug. 1, to be illegal, but the State Supreme Court held it valid in a decision handed down on Sept. 10. (See **BANKS AND BANKING**.) The St. Louis and San Francisco Railroad had its charter to operate in the State revoked on Aug. 29, and on Sept. 2, the Missouri, Kansas and Texas Railway forfeited its charter. See **RAILWAYS**.

On Dec. 8, the United States government brought suit against Governor Haskell and eight other prominent Oklahomans, including United States Senator R. L. Owen, charging them with the use of "dummies" in securing land valued at \$1,500,000 at the opening of Muskogee Reservation. The suit was brought in behalf of the Creek Indians, formerly owners of the land.

CONVENTIONS AND ELECTIONS. In the Democratic primaries held on Feb. 15, the counties of the State unanimously indorsed W. J. Bryan for president, and the State Convention was little more than a formality, ratifying this action. The Republican State Convention on Mar. 11 instructed delegates to vote for W. H. Taft for president, and passed resolutions endorsing President Roosevelt and declaring for strict enforcement of prohibition and against the dispensary. Primary elections were held on Aug. 4 for nominations for Senator. Thomas P. Gore was nominated for re-election by the Democrats, and Dennis T. Flynn was nominated by the Republicans. The part taken by Governor Haskell in the National campaign, and events connected therewith, had more than a local interest, and are noticed in the article **PRESIDENTIAL CAMPAIGN**. In the election of Nov. 3 the vote cast for the National ticket was as follows: Bryan, 122,406; Taft, 116,558; Debs, 21,729; Watson, 436; Hiagen, 47. See also **HASKELL, C. N.**

OTHER EVENTS. On Feb. 12, the Committee appointed by the Constitutional Convention of 1907 to advise the State Legislature as to the advisability of purchasing 440,000 acres of segregated coal and asphalt lands in the State, recommended the purchase of these lands at a price not exceeding \$10,000,000. In July suits were begun by the Federal Department of Justice to annual 3,000 to 4,000 deeds to land in the State. These lands which were formerly owned by the five civilized tribes of Indians, the government maintains were obtained by frauds. There are more than 1,700 defendants in the suits, scattered over the country. A recalcitrant band of the Creek Indians, known as the "Snakes," while in council at Hickory Ground, near Henrietta, resolved against the payment of taxes. Many Indians with negro blood predominating were armed as in olden days. No trouble was threatened, however, until the citizens became fearful lest the Indians become troublesome. Some citizens armed themselves and an unofficial appeal was made to the Governor for military protection. Two troops of infantry were held in readiness but never went to the scene.

The Fort Sill affair could hardly be called a riot. Drunken soldiers at Lawton, near Fort Sill, invaded a negro dive and a shooting took place, one soldier being mortally wounded and another slightly. A more serious race riot broke out in Okmulgee on Nov. 14 as the result of an attempt of the Sheriff of the county

to arrest a negro who had beaten an Indian. A mob gathered, several hundred shots were fired, and the Sheriff, two policemen, and four negroes were killed. Trouble was feared because of the large negro population in Okmulgee. State troops were held in readiness, but were not sent. On May 11, a tornado caused great damage in the towns of the State. Several persons were killed and many injured. Floods prevailed in the State in October and caused much damage.

LEGISLATION. The first Legislature assembled on the first Monday in December, 1907 and adjourned May 26, 1908. The important measures passed are noted above.

STATE OFFICERS: Governor, C. N. Haskell; Lieutenant-Governor, George Bellamy; Secretary of State, Bill Cross; Treasurer, J. A. Meneff; Auditor, M. E. Trapp; Attorney-General, Chas. West; Adjutant-General, F. M. Canton; Commissioner of Insurance, T. J. McComb; Commissioner of Education, E. D. Cameron—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, R. L. Williams; Associate Justices, Jesse J. Dunn, M. J. Kane, Jno. B. Turner, and Samuel W. Hayes; Clerk of the Court, W. H. L. Campbell—all Democrats.

The State Legislature of 1908 was composed of 5 Republicans and 39 Democrats in the Senate, 18 Republicans and 91 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES, under the section *Congress*.

OLD-AGE PENSIONS. The year 1908 was notable for a world-wide agitation of the subject of old-age pensions. The subject was actively discussed in the United States, England, France, Austria, Italy, New Zealand, and Australia. The discussion in the United States was the result of the English agitation resulting in the enactment of the law noted below. This discussion seemed to indicate that the prevailing opinion in the United States strongly favors some provision for the old-age of workmen, but prefers that a longer period of development be given to the various voluntary plans now being tried, such as industrial insurance, mutual benefit associations, and the pension schemes of corporations. Among industrial employers, trusts and railroads have been foremost in the introduction of plans for the retirement of aged employees on part pay. The modern industrial system with its rapid and intense pace demands young and vigorous men; moreover men are used up earlier than under less strenuous conditions. The specialization demanded unfits a man for other equally remunerative work, once he reaches his prime. Hence many corporations have found it not only a necessity, but good business to introduce pension systems. Among scores of corporations having pension systems may be mentioned the International Harvester Company, the Standard Oil Company, the United States Steel Corporation, and the Powder Trust, while among leading American, including Canadian, railways, the Vanderbilt lines stand almost alone as not having such a system. Paralleling the growth of these plans are the schemes in use in a steadily increasing number of cities for pensioning teachers, policemen, and firemen, after a specified term of service or at a certain age. Larger cities, almost without exception, now have such schemes.

ENGLAND. An old-age pension bill was passed by the House of Commons in July by a vote of 315 to 10, to become effective Jan. 1, 1909. The passage of this law in deference to the insistent demands of organized labor was assured more than a year before it actually was accomplished, the delay being due to exchequer readjustments to provide the necessary funds. The new law provides pensions for all persons at least 70 years of age, who are citizens of the United Kingdom, and have resided there during the 20 years preceding, and who do not belong to the delinquent, defective, or criminal classes, and who are not public dependents. This last disqualification prevents local guardians of the poor from unloading aged paupers upon the pension fund; it disqualifies about 280,000 persons. Up to Dec. 31, 1908, pensions had been granted to 596,038 persons, or 24,000 more than had been estimated for the first year. On this basis the cost for 1909, including £300,000 for administration, was put at £7,750,000. The law provides a sliding scale of pensions, the amount granted depending on the income from other sources. The largest pension is 5 shillings per week to all qualified persons who have not more than £21 income per year. Pensions of 4, 3, 2, and 1 shillings per week are granted to higher income classes; thus persons having incomes between £28 17s. 6d., and £31 10s. will receive only one shilling per week. Persons having more than £31 10s. income per year will receive no pension. The pension is thus a supplement to the small incomes of aged but respectable working folk. The post office will be utilized in distributing the pensions. For discussion of the political features of the bill, see GREAT BRITAIN, paragraph *Old-Age Pensions*.

FRANCE. A moderate old-age pension plan on a contributory basis was introduced in France in 1905. This grants pensions of five to twenty francs per week to persons at least 70 years of age, and persons who are permanently infirm, incapacitated or incurable. The original estimate of the public expense was \$3,500,000 per year, to be shared by the State, the departments, and the communes. So great has been the increase in the expense that the estimate for 1909 was \$18,800,000. The number of beneficiaries increased from 190,000 the first year to 340,000 in 1907, 470,000 in 1908, and not fewer than 495,000 in 1909. The demand for a more liberal and extensive plan has been very strong. In February, 1906, the Chamber of Deputies passed a bill granting an annual pension to all workmen over sixty who had worked for thirty years. The amount of the pension was to be increased slowly by such stages that at the end of thirty years everyone eligible would be receiving a minimum of \$6 per month. The bill provided that workmen should contribute 2 per cent. of their wages and that employers should contribute a like amount. The government should make up any amount still needed to provide the minimum pension. This bill was blocked for many months by the Senate, on the very reasonable ground that the government should furnish it with information as to the probable expenditure necessitated by the measure. The estimates of such expenditure ranged from \$28,000,000 to \$180,000,000 per year. As the Ministry was fully pledged to the measure, an overwhelming vote by the Deputies early in 1908, demanding that favorable consideration for it be secured in the Senate,

brought about a compromise. By this the age of eligibility was raised to sixty-five years, domestic servants and small farmers were excluded from the benefits of the plan, thus throwing out about one-half of the 2,600,000 eligibles, and the government's liabilities were limited for the present at \$20,000,000 annually. The bill had not yet become a law at the end of the year.

AUSTRIA. In July the Lower House of the Reichsrath unanimously adopted a resolution, introduced by the Social Democrats, in favor of workmen's insurance against old-age and sickness. The Minister of the Interior undertook the responsibility of introducing such a measure in November, but it was not pushed forward with sufficient rapidity for enactment in 1908.

ITALY. Much interest was aroused by the sessions of the International Congress on Social Insurance at Rome, Oct. 12-16. The discussions developed a strong sentiment in favor of some scheme of compulsory insurance for workmen. Reports were presented at the Congress showing that in Germany, university and technical high school lectures and the issue of a special periodical have been instituted to develop wider knowledge of the benefits of social insurance.

NEW ZEALAND. In July, the Premier announced the plan of a proposed scheme of old-age pensions, on a contributory basis. The plan called for small contributions from workmen to be supplemented from State funds. Eligibles were to be sixty-five years of age, and the pension was fixed at one-half pound (\$2.50) per week. In October the Premier presented to the Legislature an estimate of expenditures necessary to carry out the plan, showing £351,000 in 1909 and increasing very slowly thereafter. Such serious opposition developed to the contributory feature that inaction resulted.

AUSTRALIA. The Commonwealth Parliament passed an old-age pension scheme, granting 10 shillings weekly to all indigent persons over 65 years of age, who have resided in the Commonwealth 20 years. The plan also provides for pensioning persons over 16 years of age, who are permanently incapacitated. The estimated cost is \$9,000,000 annually.

OLYMPIC GAMES. The fourth Olympiad was held in the Stadium, Shepherd's Bush, London, July 13-25. The attendance at the games was much smaller than had been anticipated, while the conduct of the games also was subjected to considerable criticism, especially on the part of the United States representatives. In order to avoid a recurrence of any similar unpleasant features in the future, a movement was started to put the entire control of the games in the charge of an international committee.

The Olympic events included track and field, shooting, cycling, swimming, rowing, wrestling, tennis, racquets, archery, fencing, etc. All events considered, the United Kingdom scored 155 points, the United States 131, Sweden 31, Germany 21, and France 15. The United States was not fully represented in any except the track and field events, in which the representatives of that country made a remarkable showing, scoring a total of 114½ points. The United Kingdom was second, with 66½, and Sweden third, with 12½. Thirteen new Olympic records were made in the track and field events, nine by the United States, three by the United King-

dom, and one by Sweden. These new records include: 800-metre run, Sheppard (U. S.), 1m. 52½s.; 1500-metre run, Sheppard (U. S.), 4m. 3¾s.; 110-metre hurdle, Smithson (U. S.) 15s.; 400-metre hurdle, Bacon, (U. S.), 55s.; 5 mile run, Voight (U. K.), 25m. 11¼s.; 10 mile walk, Larner (U. K.), 1h. 15m. 57¾s.; running broad jump, Irons (U. S.), 24 ft. 6½ in.; running high jump, Porter (U. S.), 6 ft. 3 in.; hop, skip and jump, Ahearne (U. K.), 48 ft. 11¼ in.; pole vault, Gilbert and Cook (U. S.), 12 ft. 2 in.; hammer throw, Flanagan (U. S.), 170 ft. 4½ in.; discus throw (Greek style), Sheridan (U. S.), 124 ft. 8 in.; javelin throw (free style) Lemming (Sweden), 178 ft. 7½ in.

A summary of the track and field events, including winner, second, and third, countries represented, and time, follows: 100 metre run, Walker (So. Africa), Rector (U. S.), Kerr (Canada), 10½s., equalling the record; 200-metre run, Kerr (Canada), Cloughan (U. S.), Cartmell (U. S.), 22¾s.; 800-metre run, Sheppard (U. S.), Lunghi (Italy), Braun (Germany), 1m. 52½s.; 1500-metre run, Sheppard (U. S.), Wilson (U. K.), Hallows (U. K.), 4m. 3¾s.; 110-metre hurdle, Smithson (U. S.), Garrels (U. S.), Shaw (U. S.), 15s.; 400-metre hurdle, Bacon (U. S.), Hillman (U. S.), Tremer (U. K.), 55s.; 3200-metre steeplechase, Russell (U. K.), Robertson (U. K.), Eisele (U. S.), 10m. 47¾s.; 5-mile run, Voight (U. K.), Owen (U. K.), Svanberg (Sweden), 25m. 11½s.; 3-mile team race, United Kingdom, United States, France, 14m. 39¾s.; 1600-metre relay race, United States, Germany, Hungary, 3m. 20¾s.; 3500-metre walk, Larner (U. K.), Webb (U. K.), Kerr (Canada), 14m. 55s.; Marathon race, Hayes (U. S.), Hefferon (So. Africa), Forshaw (U. S.), 2h. 55m. 18s.; standing broad jump, Ewry (U. S.), Tscilitiras (Greece), and Biller (U. S.), 10 ft. 11½ in.; standing high jump, Ewry (U. S.), Tscilitiras (Greece), and Biller (U. S.), tied for second, 5 ft. 2 in.; running broad jump, Irons (U. S.), Kelly (U. S.), Bricker (Canada), 24 ft. 6½ in.; running high jump, Porter (U. S.), Sornoty (Hungary), Leahy (U. K.), and André (France), tied for second, 6 ft. 3 in.; pole vault, Gilbert (U. S.) and Cook (U. S.), tied for first, Campbell (U. S.), and Archibald (U. K.), tied for second, 12 ft. 2 in.; hop, skip and jump, Ahearne (U. K.), McDonald (Canada), and Jacobs (Canada), tied for second, Larsen (Norway) third, 48 ft. 11¼ in.; hammer throw, Flanagan (U. S.), McGrath (U. S.), Walsh (Canada), 170 ft. 4½ in.; shotput, Rose (U. S.), Horgan (U. K.), Garrels (U. S.), 46 ft. 7½ in.; discus throw (free style), Sheridan (U. S.), Giffin (U. S.) Horr (U. S.), 134 ft. 2 in.; discus throw (Greek style), Sheridan (U. S.), Horr (U. S.), Jarvinen (Finland), 124 ft. 8 in.; javelin throw (free style), Lemming (Sweden), Doriza (Greece), Halse (Norway), 178 ft. 7½ in.; javelin throw (middle), Lemming (Sweden), Halse (Norway), Nilsson (Sweden), 179 ft. 10½ in.

In the 400-metre run the order of finish was Carpenter (U. S.), Robbins (U. S.), Halswelle (U. K.). The officials, however, disqualified Carpenter for an alleged fouling of Halswelle and ordered the race re-run. The United States committee refused to accept this ruling, and Halswelle covered the course alone in 50s.

The Marathon race undoubtedly aroused more general interest throughout the world than any

other event. Dorando Pietri, the Italian runner, was the first to reach the Stadium, but his condition was such that he collapsed before the finish and bystanders including, it was alleged, some of the officials, carried away by their admiration for his pluck, rushed upon the track and carried him bodily across the line. The Italian flag was then run up as an indication that Dorando had been awarded the race. The decision of the judges was immediately protested, as Hayes (U. S.) had meanwhile finished. After some deliberation the decision was reversed and Hayes pronounced the winner.

In the wrestling events, G. W. Mehnert (U. S.) won the catch-as-catch-can (119 pounds) and G. S. Dole (U. S.), the featherweight bout. Other catch-as-catch-can events and winners were: Lightweight, Relwyskow (U. K.); middleweight, Bacon (U. K.); heavyweight, O'Kelly (U. K.). The Græco-Roman events and winners were: Lightweight, Porro (Italy); middleweight, Martensson (Sweden); light heavyweight, Wakeman (Finland); heavyweight, Weisz (Hungary).

The United Kingdom won the principal rowing events, the United States entering no contestants, largely it was said because of the ruling which barred amateur oarsman who worked for a living. The English amateur championship was won by H. T. Blackstaffe of the Vesta Rowing Club. Magdalen College, Oxford, defeated the Leander Crew in the four-oared race, and Leander defeated the Belgian crew in the eight-oared race. The principal cycling events were: 20-kilometres, won by Kingsbury (U. K.) in 34 m. 13½s.; 585-metre won by Johnson (U. K.) in 51½s.; 2000-metre (tandem), won by Schell and Aufray (France) in 3m. 7½s.; 5000-metres, won by Jones (U. K.) in 8m. 36½s.; 100 kilometres, won by Bartlett (U. K.) in 2h. 41m. 48½s. The United Kingdom won in archery, racquets, tug of war, and swimming, the United States in shooting, Sweden in gymnastics, and France and Hungary in fencing. See SHOOTING; SWIMMING; LAWN TENNIS; etc.

OMAN. An independent State of southeastern Arabia. Area, about 75,000 square miles; population, about 500,000. Muscat, the capital and principal port, with its suburb, Matra, has about 25,000 inhabitants. In 1907-8 the imports and exports amounted to Rs. 9,846,560 and Rs. 4,245,450 (1 rupee = 32.44 cents) respectively. The leading imports are coffee, piece goods, arms and ammunition, kerosene oil, yarn, wheat, and sugar. The principal exports in 1907-8 were: Dates, Rs. 1,731,300; pearls, Rs. 250,000; mother-of-pearl, Rs. 71,000; dried limes, Rs. 83,950; fish, Rs. 70,000; hides and skins, Rs. 60,000; fruits, Rs. 42,200. The trade is largely in the hands of East Indians, of whom there are about 1,300 in Oman, and over one-half the foreign trade is with India. Other countries largely participating in the trade are Great Britain, Belgium, France, Persia, and the United States. The ports were entered in 1907-8 by 678 vessels, of 426,824 tons. The Sultan is under agreement with Great Britain to cede no territory to any other Power. A British Political Agent resides at Muscat. The present Sultan is Seyyid Faysal ben Turki, who succeeded his father on June 4, 1888.

ONTARIO. A province of Canada. Area, 260,862 square miles. Population in 1901,

2,182,947. Toronto, the capital, had 208,040 inhabitants in 1901. Ottawa, the capital of the Dominion, had 59,928 inhabitants. For details respecting population, education, production, commerce, etc., see CANADA. The provincial government consists of a Lieutenant-Governor, appointed by the Governor-General of Canada and acting through an Executive Council, or responsible ministry, and a unicameral Legislative Assembly of 98 members, elected for four years. The present Lieutenant-Governor is Col. John Morrison Gibson. The present Premier is Sir James P. Whitney.

HISTORY. The last session of the eleventh Parliament of Ontario began in February, and was noteworthy for the number and importance of the laws enacted. Among these were acts adopting more modern methods of dealing with criminals and utilizing their labor so as not to compete with free labor; increasing the representation in the legislature; raising to twelve years the age limit for employment of children in shops; legalizing by-laws and agreements between the municipalities and the hydro-electric Commission; amending the liquor laws; and providing that hereafter the timber and minerals not already disposed of on lands acquired by actual settlers shall be the property of the settlers. A scheme of law reform with a view to decreasing appeals by establishing a single court therefor had been prepared but was held over till next session. On the expiration of the term of Sir Mortimer Clark, as Lieutenant-Governor, Hon. J. M. Gibson was appointed to succeed him. Hon. N. Monteith, Minister of Agriculture, resigned and James S. Duff was appointed in his place. The elections for a new legislature were held on June 8, and Premier Whitney's administration won a decisive Conservative victory, the Liberal opposition, led by Hon. A. G. McKay, being put in a small minority of 18 as against 85 for the Conservatives.

OPERA. See MUSIC.

OPIUM. According to the latest estimates Chinese grown opium amounts yearly to 325,000 piculs—a picul equalling 133 pounds. Imported opium amounts to 54,000 piculs. In 1906 the Chinese government issued an edict commanding its viceroys, the Tartar generals, and governors of provinces to join in suppressing the opium habit. (See CHINA, *Production, Commerce, and History*.) On Mar. 8, an effective prohibition against the illicit use of opium went into force in the Philippines. Secretary Root invited those nations having territorial possessions in the Far East to a conference, Great Britain, Germany, France, Portugal, the Netherlands, China and Japan being represented. These powers consented to appoint three commissioners each to meet the American Commissioners on Jan. 1, 1909, at Shanghai, China. In the meantime, each national commission was to study the subject from its own point of view. Hamilton Wright, acting chairman of the American Commission, called attention to the undoubted growth of the opium habit in the United States. Although the Chinese population is smaller than it was 20 years ago, the importation of chându, or smoking opium, has been more than doubled. This can only mean an increase of its use among the whites. Against Kane's estimate in 1882, that there were 6,000 white opium smokers in the United States, is

THE OLYMPIC GAMES OF 1908—THE MARATHON RACE
THE START, LEAVING THE GATES OF WINDSOR CASTLE

that of Wright, who, in 1908, believed there were 5,000 in New York City alone, and over 100,000 in the United States, at that time. The imports of crude opium had doubled and handlers of the produce estimate that 60 to 90 per cent. of the morphine manufactured therefrom is used in illicit ways. In the Federated Malay States the so-called "missionary treatment" of the opium habit was extensively used with reported signal success. An infusion or other preparation of the "Jungle Plant" (*Combretum sundiacum*) was used. This plant is described by Sir George Young in his *Materials for a Flora of the Malayan Peninsula*, and its use for a cure for opium addiction is believed to have been discovered by Chinese wood cutters. See COCAINE HABIT.

ORANGE RIVER COLONY. A British possession in South Africa. Area, 50,392 square miles; population, 1907, 447,100. The number of whites was 142,679 in 1904. Bloemfontein, the capital, had 33,032 inhabitants in 1905 (13,512 whites, 3,487 troops, 16,033 natives). Other towns, with their populations in 1904, are: Kroonstad, 5,797; Jagersfontein, 5,650; Harri-smith, 5,306; Ladybrand, 3,207. In 1907 there were 17,700 pupils in the government schools. Children may choose English or Dutch as the medium of instruction. The principal mineral products are diamonds and coal. Gold has been found. Oil-bearing strata exist in the Ladybrand district. Of the 1,628,713 acres of public land existing at annexation, 1,285,000 have been distributed among 718 settlers. Grazing is the principal occupation, and live stock is numerous. The imports and exports in 1907-8 amounted to £3,317,770 and £3,789,653 respectively. The imports are chiefly cotton goods and apparel, timber, hardware, foods, and drinks. The principal exports are wool, mohair, hides and skins, wheat, ostrich feathers, and dairy produce. The colony is included in the South African Customs Union. (See BRITISH SOUTH AFRICA.) The railways are administered together with those of the Transvaal (q. v.) by the Inter-colonial Council, under the name of the Central South African Railways. There are over 4,000 miles of telegraph line. Responsible government was established on July 1, 1907. The Legislative Council consists of 11 members; the Legislative Assembly, of 39 members. The Governor in 1908 was Sir Hamilton Goold-Adams; the Premier, A. Fischer. The finances are partly administered by the above mentioned Inter-colonial Council. The revenue in 1907-8 was £740,367; the expenditure, £33,233.

HISTORY. On Dec. 18, 1907, the first Legislative Assembly under the new constitution opened with Mr. Abraham Fischer as Premier. The Dutch party had won a complete victory in the election, obtaining 30 out of the 38 seats. Only the most urgent business was transacted at this session. The regular business session began on May 13. The proceedings were conducted first in English and afterwards in Dutch. The chief debate was occasioned by the Education Bill, which, however, was finally carried toward the end of August on the basis of a compromise whereby Dutch and English were put on the same footing in the schools, the parents having the right to choose either for their children. No educational officer was to be dismissed for ignorance of the Dutch language.

Education was made compulsory and a Council of Education was established.

OREGON. One of the Pacific Division of the United States. Its total area is 96,699 square miles. The population, according to Federal estimate in 1908, was 495,138.

MINERAL RESOURCES. The mineral production of the State in 1907 was valued at \$2,630,587, which was almost exactly the value of the product of 1906, which was \$2,640,406. The most important product in point of value was gold, of which there were mined in 1907 59,124 fine ounces, valued at \$1,222,200 as compared with 66,123 fine ounces valued at \$1,366,900 in 1906. Clay products rank next in point of value, amounting in 1907 to \$545,839 as compared with a value of the product in 1906 of \$506,192. There were produced in 1907 518,694 pounds of copper valued at \$103,739; in 1906 there were produced 545,859 pounds, valued at \$105,341. Other mineral products of the State in order of their value are sand and gravel, stone, silver, lime, and mineral waters.

It is not expected that the final returns for 1908 will show much variation in the usual figures for production in the mines of the State. A few concentrating and cyaniding plants and small smelters were installed in the State throughout the year, and a few new mills also were built. The Director of the Mint estimates the production of gold for 1908 at \$1,119,528, as against \$1,122,200 in 1907. The silver production is small.

AGRICULTURE AND STOCK RAISING. The acreage, production, and value of the principal farm crops in 1908, according to the United States Department of Agriculture, were as follows: Corn, 440,000 bushels, valued at \$343,000 from 16,000 acres; winter wheat, 10,858,000 bushels, valued at \$9,121,000 from 468,000 acres; spring wheat, 4,290,000 bushels, valued at \$3,604,000 from 260,000 acres; oats, 9,519,000 bushels, valued at \$4,474,000 from 285,000 acres; barley, 1,798,000 bushels, valued at \$1,061,000 from 62,000 acres; rye, 162,000 bushels, valued at \$138,000 from 9,000 acres; potatoes, 4,257,000 bushels, valued at \$2,895,000 from 43,000 acres; hay 828,000 tons, valued at \$7,700,000 from 414,000 acres. The agricultural development of the State has been greatly assisted in recent years by a number of important irrigation projects carried on by the United States Reclamation Service. (See IRRIGATION.) The area devoted to the cultivation of apples, prunes, and apricots has been greatly extended in recent years. The number of farm animals by thousands on Jan. 1, 1909, were as follows: Horses, 299,000; dairy cattle, 169,000; other cattle, 743,000; sheep, 2,634,000; swine, 290,000. The wool clipped in 1908 was estimated at 16,500,000 pounds, valued at \$2,659,800.

MANUFACTURES. The value of the products of establishments classed as factories was \$55,525,000 in 1905, against \$36,592,700 in 1900, an increase of 51.7 per cent. The values due to leading industries in 1905, and (in parentheses) the per cent. of increase over 1900, were: Lumber and timber products \$12,483,900 (21.7); flour and grist mill products, \$8,467,000 (38); slaughtering and meat packing, \$2,907,100 (77); printing and publishing, \$2,664,100 (86.3); planing mill products, \$2,653,300 (30.5), and canning and preserving fish, \$2,577,746 (44.1). Portland was credited with \$28,651,300 of the

total value of products, and Astoria with \$3,-092,600.

FISHERIES. The most important product of the fisheries of Oregon is salmon. There were packed of this fish in 1907 22,908,700 pounds, a falling off from the figures of 1905, which were 24,425,291 pounds. Of the fish packed, 19,010,120 were chinooks. This pack was taken entirely from the Columbia River. There were packed from coast streams in 1906, 8,043,690 pounds. The State, through its fish commissioners, has done good service in the artificial propagation of fish, and there is little fear that the production will decrease from diminution of the quantity of fish in the rivers. The legislature in 1905 made a special appropriation of \$25,000 for restocking the Columbia River and coast streams with fish.

EDUCATION. Laws passed at the legislative session of 1907 had a beneficial effect upon the development of education in Oregon in 1908. The compulsory education law brought the average daily attendance for the year 1908 to 94,333, as against 76,954 in 1907. The percentage of attendance in 1908 was 93. The first annual convention of County Superintendents was held at Salem, Sept. 10th and 11th, 1908. Nearly every county superintendent in the State was present and many important measures were discussed. This convention prepared many measures to be submitted to the legislative session of 1909. The law providing for a district school officers' convention was also productive of much good. This convention was held in each county and as one result of the meetings, the number of districts voting a special tax to carry on their schools is increasing. The Legislature of 1907 raised the minimum tax levy of the schools from \$6 to \$7 per capita for children of school age. It also provided that every school must have and display a United States flag. A law providing \$125,000 per annum as a continuing fund for the support of the State University was referred to the people and approved by them. The school population for 1908 (ages 5 to 19 inclusive) was 160,042. The teachers numbered 4,243; of these 3,460 were women and 783 men. The average monthly salary of men teachers was \$65.64; of women, \$50.16; the average monthly salary of rural teachers was \$49.60; of assistant teachers in graded schools, \$56.35; of principals, \$80.87. The average yearly salary of State Superintendents was \$1,576.17. An evidence of the advance of Oregon in educational affairs is shown by the remarkable growth of high schools in the State within the last few years. During 1908 there were in operation 43 four-year high schools; 15 three-year; 43 two-year; and 37 one-year. Districts are permitted to unite for high school purposes and many are taking advantage of this privilege.

FINANCE. The biennial report of the State Treasurer for the fiscal year 1907-8, showed a balance on hand Oct. 1, 1906, of \$415,340. The receipts included transfers for the two years ending Sept. 30, 1908, \$5,770,103; the disbursements, including transfers for the two years for the same period, were \$5,527,124, leaving a balance on hand Sept. 30, 1908, of \$658,320. The educational funds of the State included the following amounts on Sept. 30, 1908: Common school fund, \$5,429,930; agricultural college fund, \$195,878; university fund, \$104,205. The net income of the common school fund in 1908

was \$256,067, of the agricultural college fund, \$24,065, and of the University fund, \$12,153. The receipts from the inheritance tax for the year 1907-8 were \$44,569. The State has no debt bonded or otherwise.

CHARITABLE AND CORRECTIONAL INSTITUTIONS. Among the laws of importance to charitable and correctional institutions passed by the legislative session of 1906 were those providing for special juvenile courts for dependent, neglected or delinquent children, and for the establishment of an institution for the feeble-minded and epileptic children. The State Reform School, the School for the Deaf Mutes, and the Institution for the Blind at Salem had an enrollment in 1906 of about 120, 80, and 30 respectively. Appropriations for all the State charitable and penal institutions for 1908 amounted to \$850,000, the amount spent in maintenance and improvements, \$60,800. The juvenile courts have proved to be a wise step and have been of great assistance in helping the Reform School and the youth of Oregon. The new buildings for the Institution for the Feeble-minded were completed during 1908.

POLITICS AND GOVERNMENT. The primary election of June 1 was among the most important ever held in the history of the State, and, in one of its results, one of the most unique ever held in this country. While there were important measures at issue, the most important question to be decided was the nomination for United States Senator. This primary election was held under the direct primary law, passed in 1904. By this law the popular vote for United States Senator was not merely advisory, but its result was made binding upon the individual members of the legislature by pledges which they had made previous to election, to vote, if elected, for that person who should receive a plurality of the vote cast by the people for the Senatorship. The pledge is, however, voluntary. Oregon is normally a Republican State and in the election of June 1 the Republican representatives were reelected by majorities of approximately 20,000 votes each. In the senatorial primary election, Governor George E. Chamberlain, a Democrat, received a majority over H. M. Cake, the Republican candidate, of 1,522. Mr. Cake had previously, on Apr. 17, defeated at the Republican primaries Senator Fulton, who was seeking reelection. Governor Chamberlain had been nominated as the Democratic candidate. Thus, while the legislature was strongly Republican, its members were bound by pledges made prior to their election to vote for Mr. Chamberlain for Senator, although he is a Democrat. In this election 13 counties voted for no license under the local option law, making a total of 21 counties in the State having no license. Majorities in other counties against prohibition were small, and in all of them some precincts went "dry," including several precincts in the city of Portland. The number of initiative and referendum measures to be decided by the election was 19. Four of these were constitutional amendments referred to the people by the legislature, four were legislative measures by petition of the people on which the referendum had been ordered, and the other eleven were laws or constitutional amendments which the people had proposed by initiative petition. Among the measures which were defeated were the "open town" bill, which was

designed to nullify the local option law; woman suffrage; and a measure providing for single taxation. The adoption of two to one majorities for the recall of public officers greatly extended direct legislation. A proportional representation amendment to the State constitution was likewise adopted. A corrupt practices act was carried and a measure instructing members of the legislature to vote for the people's choice for United States Senator.

CONVENTIONS AND ELECTIONS. The results of the elections held in April and June are given in the paragraph above. On May 14 the Republican State Convention for the nomination of delegates to the National Convention met at Portland. The convention gave unanimous indorsement for the candidacy of Wm. H. Taft. On June 9, the Democratic State conventions to choose delegates to the National Convention elected delegates pledged to William J. Bryan for President. In the election of Nov. 3, William H. Taft received a plurality over William J. Bryan of over 24,000 votes. The detailed vote for the National ticket was as follows: Taft, 62,530; Bryan, 38,049; Debs, 7,339; Chafin, 2,682; Hisgen, 289.

OTHER EVENTS. On Jan. 6, the United States Supreme Court reversed the conviction of former Representative John N. Williamson, convicted of complicity in the Oregon land frauds. This conclusion was based on the error of the trial court in holding that the Timber and Stone Acts, under which the offenses were committed, required affidavits for proof of final entry. The court decided that the law contained no such requirement and that the land office had no power to write into it such regulations. As this was a fundamental error, the judgment of conviction must be reversed. As the prosecution of other land fraud cases was conducted upon practically the same assumption as was this trial, the decision had a serious effect on their prosecution. On Feb. 8, John H. Hall, former United States District Attorney, indicted for conspiracy with the Butte Creek Land, Livestock and Lumber Company to maintain an alleged illegal fence which enclosed 20,000 acres of public land in Wheeler county, was found guilty. Many other indictments were found under this charge, but this was the only case tried. On June 9, a special grand jury at Portland indicted 11 men on charges of conspiracy to defraud the government of 30,000 acres of public land in the Umatilla Reservation. See **LANDS, PUBLIC.**

STATE OFFICERS: Governor, G. E. Chamberlain, Dem.; Secretary of State and Auditor, F. W. Benson, Rep.; State Treasurer, Geo. A. Steele, Rep.; Superintendent of Public Instruction, J. H. Ackerman, Rep.; Adjutant-General, Wm. E. Finzer, Dem.; Attorney-General, A. M. Crawford, Rep.

JUDICIARY. Supreme Court: Chief Justice, Robert S. Bean; Justices, Frank A. Moore and Robert Eakin; Clerk, J. C. Moreland—all Republicans.

The State legislature of 1909 is composed of 23 Republicans and 6 Democrats in the Senate, 51 Republicans and 7 Democrats in the House. The State representation in Congress will be found in the article **UNITED STATES**, in the section *Congress*.

ORGANIC CHEMISTRY. See **CHEMISTRY.**

ORNITHOLOGY. In Aug., 1908, three new bird reservations were established by executive order from President Roosevelt. These are the Key West Reservation, in the Gulf of Mexico; the Klamath Lake Reservation in Oregon and California; and the Lake Malheur Reservation in Oregon. Walter discussed the question of bird migration, in which he decides that birds find their way chiefly by means of landmarks, but reaches no definite conclusions as to why they migrate. In this connection, experiments by Watson are of interest. Noddies and sooty terns were taken from the Tortugas and released at varying distances from there along the Atlantic coast, some of them from as far north as Cape Hatteras, which is north of their usual area of migration. In all cases they returned to the starting point. This seems to indicate some "sense of direction." From South Carolina came the report that two colonies of the Snowy Heron (*Egretta candidissima*) had become established on the Atlantic coast of that State. Deane notes in the *Auk* that the only living passenger pigeons now known are three in the Cincinnati Zoological Garden, and four in confinement in Milwaukee, Wis. Cameron, observing the habits of the Golden Eagle in Montana, concludes that while it may in some localities kill large numbers of grouse, it is often of the greatest value to farmers because of the numbers of prairie dogs which it kills. He estimates that one pair of eagles will kill 636 dogs in four months. The Royal Society for the Protection of Birds, of London, has offered a prize of the society's gold medal for the best essay on "Comparative Legislation for the Protection of Birds." In the House of Lords, Lord Avebury has introduced a bill to prohibit the random slaughter of birds. This bill is framed along the same lines as the New York State legislation on this subject. In Scotland, two county councils have removed gulls from the list of protected birds. In *Sketches of South African Bird Life*, Haagner and Ivy noted some breeding habits of the cuckoos. The birds lay their eggs on the ground and carry them in their bills to the nests of other birds which they are too large to enter. The African cuckoos lay colored eggs, but when they lay in nests of birds whose eggs are white, the cuckoo often lays a white egg. The authors did not state if the same bird may lay two sorts of eggs, or if there are perhaps two strains. Godman began to publish a complete account of the *Turbinaries*, having recently been able to secure information hitherto not obtainable concerning their breeding habits in the comparatively inaccessible Antarctic regions.

OXYGEN INHALATIONS AND MUSCULAR EXERCISE. Leonard Hill, of the London Hospital, conducted some remarkable experiments during 1908, showing the beneficial effect of oxygen inhalation in athletics. Investigating the phenomena of difficult breathing, Hill found that a man could hold his breath three times the normal period by taking three inhalations of oxygen. Dr. Vernon, of Oxford, held his breath for 8½ minutes under these circumstances. These and other experiments led to the belief that the panting and distress of athletes might be relieved by the inhalation of oxygen before and after great muscular exertion. This proved to be the case. Runners were enabled to

excel their own records with less distress and ensuing muscular stiffness and instability. Further observations on himself, athletes, and horses, convinced Hill and his co-worker, Flack, that these inhalations, followed by or accompanying exercise, constitute a most efficient form of treatment in fat dyspnoic people, and those who overeat and take too little exercise; and in cases of emphysema and heart disease treated by graduated muscular work. The bodily metabolism is increased and fatigue immensely diminished. It is suggested that in tropical regions, where the fatigue following exercise is well known, oxygen inhalations may considerably abate mental and bodily fatigue and make exercise easier.

OXYRHYNCHUS, EXCAVATIONS AT. See ARCHAEOLOGY.

PAGE, CARROLL SMALLEY. United States Senator (Republican) from Vermont. He was born at Westfield, Vt., on Jan. 10, 1843. He received an academic education at Morrisville and Hyde Park. From 1869 to 1872 he served in the State House of Representatives and from 1874 to 1876 in the State Senate. He was State Finance Inspector from 1884 to 1888 and chairman of the Republican State Committee from 1886 to 1890, having been elected governor in the last named year. On Oct. 21, 1908, he was elected United States Senator by the legislature, succeeding John W. Stewart (q. v.), who had been appointed *ad interim* by the governor to fill out the unexpired term of Redfield Proctor. Senator Page received the degree of LL.D. from Norwich University in 1893.

PAINTING. The dearth of new men of promise in the American exhibitions of painting during 1908 continues to be, as it has been during the last ten years, a source of disquiet to American art lovers. Taking the two exhibitions of the New York Academy of Design as a measure of American art achievement during the year, for pretty much all pictures of value are shown there before beginning their wanderings to other cities which hold annual exhibitions, the output for the year was not impressive even as compared with that of 1907, which by common consent was not worthy of extravagant praise. This may be said notwithstanding that the Academy Exhibitions of 1908 showed an uncommonly large number of canvases by the so-called secessionist group of American painters whose representation on the Academy walls would, it was predicted, fill the rooms with much needed life. The Academy's hospitality resulted in a few good pictures, and in many that tried the patience.

At the spring exhibition the Saltus medal went to Edmund C. Tarbell for a sympathetic portrait of President Seelye of Smith College, perhaps the best portrait shown. Robert D. Gauley took the Thomas B. Clark prize for an idealistic portrait sketch entitled "Tanegra," a young woman holding a figurine. Of the Hallgarten prizes, the first went to Ernest Lawson for "Ice on the Hudson"; the second to George Bellows for a view of the North River; and the third to W. W. Gilchrist for his "Daughter and Doll." The Inness gold medal was awarded to W. Granville Smith, a young painter who until three years ago was chiefly known as an illustrator. His "Indian Summer," which was honored as the best landscape on exhibition, was even more notable for promise than achievement,

Among the portraits shown some of the best were, besides that of President Seelye already mentioned, John W. Alexander's "Study in Black and Green," which did justice to an attractive model; those by John S. Sargent of Dr. Edward Robinson of the Metropolitan Museum, and of Mr. Henry Cram, neither of them peculiarly characteristic of the force and technical excellence usually shown by this noted painter. J. J. Shannon's portrait of Mrs. Samuel Untermyer, John Sloan's portrait of a man, Wilhelm Funk's portrait of Mrs. Spotswood, Irving R. Wiles' portrait of Paul Cornoyer, and William M. Chase's portrait of W. J. Curtis, are some of the pictures that attracted attention. One of the popular pictures, and a good one despite its title, "A Cup of Tea, a Cigarette, and She," was Harry W. Watrous' saucy young woman smoking a cigarette. Also much praised was Sergeant Kendall's "Narcissa," a little nude girl admiring herself in the mirror, and Hugo Ballin's "Under the Pergola," an ambitious decorative composition. Still another little nude girl of some charm was H. S. Hubbell's "Lorette."

Among landscapes of note were Emil Carlsen's "Windham Hill," Leonard Ochtman's "Evening Light," Elmer Schofield's "Old Mills on the Somme," Walter Clark's "Sundown at the Ford," E. W. Redfield's "The Road," and Albert Groll's "New Mexico." Other pictures of the spring exhibition that call for mention were Mr. LaFarge's "Wolf Tamer," J. Alden Weir's "Ballet Girl," a figure entitled "West Wind," by Winslow Homer, Horatio Walker's "Woodcutters," D. W. Tyron's "Before Sunrise," and S. J. Woolf's "News-stand."

In the winter exhibition, which was opened in December with three hundred and thirty-eight pictures and a notable display of sculpture, Mr. Sargent's portrait of Mr. and Mrs. Pulitzer attracted much attention, much praise, and no little criticism. That of Mr. Pulitzer was conceded to be by far the best, the garish decorative scheme of the other portrait marring its technical brilliancy. A portrait of Miss Helen Brice was far below Mr. Sargent's standard. Good portraiture was contributed by George N. Reeves ("Miss Mary and her Aunt"), Howard G. Cushing (the young woman with red hair this artist paints so often and so well), Miss Emmett (Mr. H. C. Perkins), G. L. Nelson (Chester Beach), Norval H. Busey (H. W. Ranger), Louis Betts (Martin O'Brien), J. J. Shannon (Mrs. Ickelheimer, one of the best portraits shown), Hulda Parton ("A Brown Study"), Wilhelm Funk (his own portrait), and August Pollak's picture of his mother. Some of the disappointments in this field were Mr. Wiles' portrait of Mrs. James M. Beck, and Mr. Beckwith's portrait of Mrs. Inge. Neither of these artists did themselves justice.

Of figure pieces were F. B. Williams' "The Cascade"; Lillian M. Jenth's "Sun-Maiden," a fairly successful nude; Mr. H. R. Butler's "Summer Breeze," a graceful girl with wind-blown draperies; Sergeant Kendall's "Mischievous," a fascinating little nude; William Thorne's delightful girl with a crystal ball; and W. Granville Smith's admirable sun-lit picture of his little daughter, entitled "Queen's Lace." Good landscapes were by A. L. Groll ("Shower in Arizona"), Ben Foster ("Late Afternoon"), F. K. Rehn ("Sunlight and Shadow"), C. H.

Davis ("Cloudland"), Arthur Parton ("Moonrise"), Carlton Wiggins ("August afternoon").

The Carnegie prize went to Henry B. Fuller's colossal allegory, "The Triumph of Truth Over Error," an award bitterly criticised and later denounced upon the ground that the artist had received an undue amount of suggestion and help in a work sadly academic. Mr. Kendall's "Mischief" took the Isidor memorial medal, and the Proctor prize was awarded to C. N. Flagg for his portrait of Paul W. Bartlett.

Other pictures of interest were W. M. Chase's vigorous still-life of fish, E. W. Redfield's "In Port," F. A. Bridgman's "Return from the Masked Ball," Hugo Ballin's "Mother and Child," C. C. Cooper's "Rochester Bridge," C. W. Hawthorne's "Return" (a young fisherman painted with fine vigor), Horatio Walker's "Bootcutters," and J. G. Brown's inevitable "Bootblacks," the same youngsters that the veteran artist has been painting for the last forty years. Some of the other artists worthily represented were Frank DeHaven, Abbott Fair, Gifford Beal, Paul Cornoyer, C. M. Dewey, Francis C. Jones, George W. Maynard, Jerome Myers, William A. Coffin, Edward Potthast, Jonas Lie, Childe Hassam, and H. W. Ranger.

At the New York Water Color Society exhibition held in May the notable pictures were Gordon Grant's "Aquarium," a sketch of people peering into the fish tanks; George W. Edwards' "Fair Amalfi," a brilliant bit of color; Childe Hassam's "Green Jade Gown"; Florence B. Brown's studies of children; a sheep-shearing scene by Georgia T. Fry; some excellent figure studies by Alice Schille; Hilda Belcher's "Speculation," a delightful delineation of childhood; and W. J. Whittmore's "Romance." At the Water Club Show, opened in October, the Beal prize was won by Adelaide Deming for her "Moon Shadows," a picture full of poetry. Other good pictures were Edward Dufner's "Summer Evening," a tranquil landscape with women's figures nicely done; C. W. Eaton's "Venice"; C. C. Cooper's clever city sketches; Charles P. Gruppe's satisfactory Holland pictures that hold their own with the best of Dutch water color work; flower pieces of uncommon merit by Louis Rhead; a Venetian scene by Rhoda H. Nichols; Marianna Sloane's "Pollard Willows"; and sketches for stained glass by John La Farge. Pastels were admitted to the exhibition and made an interesting group.

Among the smaller exhibitions held in New York were those of paintings by Charles N. Dewey, Wilhelm Funk, Mrs. Ella Condie Lamb, Arthur W. Dow, and W. L. Lathrop. Eight artists—Messrs. Arthur B. Davies, W. J. Glackens, Robert Henri, Ernest Lawson, George Luks, Maurice B. Prendergast, Everett Shinn, and John Sloan—united in the exhibition of some fifty or sixty pictures, many of them well worth showing. Women artists to the number of nearly fifty in an exhibition of their own showed about eighty pictures. By common consent Miss Marion Powers' "En Famille," and Miss Ella Richards' "A Difficult Stitch," stood first and second in merit.

At the Carnegie Institute's twelfth annual exhibition in Pittsburgh, in April, the first prize of \$1,500 went to Thomas W. Dewing for a capital picture of a young girl toying with a necklace. Henri Leidsaner took the second prize or \$1,000 for a Venice nocturne of great charm.

To Emil Carlsen's "Surf" was awarded the third prize of \$500. Public opinion agreed with the judges. Among the American artists who contributed work of notable merit to the Pittsburgh exhibition were Charles W. Hawthorne, Cecilia Beaux, Robert Henri, Gari Melchers, Paul Cornoyer, D. W. Tryon, Walter Mac Ewen, Thomas Elkins, and Willard L. Metcalfe. Among the many foreign artists represented were Zorn, Lavery, Cottet, Raffaelli, Villegas, and Mesdag. One whole gallery was devoted to the work of Winslow Homer, lent by private collectors and public institutions. This in itself constituted an exhibition of importance.

The Corcoran Gallery exhibition (Washington) was of more than usual interest. The first prize fell to Edward W. Redfield for a virile snow-scene, and the second to Joseph De Camp for his graceful figure of a woman playing on the guitar. Robert Reid took the third prize for a picture of a woman before the fire. The fourth prize was awarded to Frederick Frieseke, an American living in Paris, for a well modeled nude. Robert Macameron, Henry Hubbell, John S. Sargent, Gari Melchers, H. W. Ranger, and Cecilia Beaux were some of the artists well represented.

The Pennsylvania Academy exhibition (Philadelphia), opened in June, was the most ambitious yet held by that institution, nearly a thousand paintings being shown. Portraits by John S. Sargent ("Lady with a Rose"), William M. Chase, E. C. Tarbell, and Frank W. Benson were much admired. In landscape work Ben Foster, Edward W. Redfield, W. Elmer Schofield, Albert Groll, C. C. Cooper, and Willard L. Metcalfe were prominent. Thomas G. Cushing and Thomas P. Anschutz had good figure pieces.

Boston's Copley Society held a fine exhibition late in April of work by Millet, Corot, Daubigny, Rousseau, Diaz, Troyon, and other French artists.

The salon of the Société des Artistes Français was opened in Paris in April with nearly twelve hundred pictures on the walls. The artists whose work attracted particular attention were Lhermitte, Zuloaga, Zacharian, Détaille, Lucien Simon, Laurens, La Touche, Roll, Picard, Lepère, and Cottet, Edouard Détaille, with a great allegorical picture, "Le Chant du Départ," and J. P. Laurens' "Beethoven," were the sensations of the salon. Leo Cauvy had an oriental scene of much strength. Of the hundred or so American exhibitors, Richard Miller, H. O. Tanner, Henry S. Hubbell, E. W. Redfield, C. W. Eaton, Frank Boggs, and Walter Mac Ewen were well represented.

The London Royal Academy exhibition offered but little of interest. Herkomer's huge and empty portrait group of the Council of the London Academy was typical of the whole exhibition.

PALMA, TOMAS ESTRADA. The first president of the Republic of Cuba, died at Santiago de Cuba, Nov. 4, 1908. He was born in Bayamo, on July 9, 1835, and was educated in Spain. Returning to Cuba, where he had inherited extensive estates, he soon became one of the leaders in the movement towards Cuban independence. On the outbreak of the Ten Years' War in 1868, he freed his slaves and joined the insurgent army, becoming a general and afterwards president of the provisional government. He was

finally captured and remained in prison in Spain until the collapse of the insurrection in 1878. An exile from Cuba, with his estates forfeited, he went to Honduras, where for a time he served as postmaster-general, and later to the United States, where he opened a school at Cherry Valley, N. Y. He organized with others the Cuban uprising of 1895 and was the head of the Junta in the United States, which raised funds and aroused public sympathy for the movement. He was elected the first president of the new republic in 1902 and re-elected in 1906. His first term was quiet, but after his reelection a revolutionary movement was inaugurated by the Liberal opposition, and Palma resigned after invoking the intervention of the United States. The purity of his patriotism was never questioned, but he lacked the strength of character to cope with the difficulties of his position.

PANAMA. A republic occupying the Isthmus of Panama. Its greatest length is 420 miles, its greatest width 118 miles, its narrowest part is 31 miles wide, and its area is estimated at from 31,570 to 33,776 square miles. The population numbers about 400,000, mostly a mixed race of Spanish, Indian, and negro origin. There are about 40,000 negroes and 2,000 Chinese. The principal towns and ports are: Panama, the capital, with 35,664 inhabitants (1908); Colon, or Aspinwall, 15,271 (1908); Bocas del Toro, 6000; Cristobal; and Ancon. Water and sanitary works have been established in Panama, Colon, and other parts by the American Canal Commission.

PRODUCTION. The mineral resources are but little known. Mother-of-pearl fishing is carried on in the Bay of Panama, and turtle shells are exported. The forests contain valuable hardwoods, dye woods, resinous woods, and medicinal plants. Brier wood, vegetable ivory, cocoanuts, milk of the medlar tree, and some rubber are exported. Bananas constitute the most important agricultural product and export article. Other products are cacao, coffee, sugar-cane, rice, corn, yams, and sweet potatoes. The province of Bocas del Toro has a large area of pasture land and a large number of cattle. A Spanish colony has been established in this province, and there are some American plantations. In 1905 there were in the republic some 65,000 cattle, 17,000 horses, 1,500 mules, 28,000 hogs, 200,000 sheep, and 3,000 goats. Chocolate, mineral waters, ice, and soap are made for local consumption. The manufacture and importation of tobacco, cigars, cigarettes, and salt is a government monopoly, but has been leased to private persons.

COMMERCE AND COMMUNICATIONS. In 1907 imports aggregated \$25,284,460, and exports, \$1,960,665, against \$17,951,428 and \$1,035,786, respectively, in 1906. The imports in 1907 included dutiable merchandise, \$9,564,450; canal supplies, free of duty, \$11,100,000; and imports on account of the commissaries, approximately \$5,000,000. Of the dutiable imports, \$5,196,964 was from the United States, \$2,028,112 from Great Britain, \$1,061,858 from Germany, and the remainder was credited chiefly to France, Spain, Italy, and Belgium. The leading imports included ammunition, automobiles, boots, and shoes, carts and carriages, cement, drugs and chemicals, clothing, furniture, machinery, rice, and soap. The exports were bananas, (representing 70 per cent. of the total), rubber, cocoanuts,

woods, drugs, hides, ivory nuts, tortoise shell, mother-of-pearl, sarsaparilla, coffee, cacao, horns, tuna gum, and deerskins. The principal port of export is Bocas del Toro, on the Atlantic, shipments from which in 1907 amounted to \$1,423,084. The imports of the United States from Panama during the fiscal year ending June 30, 1908, amounted to \$1,469,344, and the exports to Panama, \$18,232,666. The tonnage entered and cleared at the port of Ancon in the fiscal year 1907-8 was 352,390 and 352,484, respectively. The interoceanic railway, 47 miles long, connects the ports of Panama and Colon. It is owned by the United States under the name of the Panama Railroad Company, and is now completely double-tracked. A part of the line is being moved to the east, due to the overflow from the canal. The United Fruit Company, an American corporation, has constructed a railway from Almirante, a few miles by water from Bocas del Toro, to Changuinola, where the company owns plantations, a distance of some 13 miles. In 1907 the government granted a concession for the establishment of an automobile service in Panama, Colon, and other cities, for the transport of passengers and goods. A mortgage and security bank has been established for the purpose of lending money to farmers and landowners at low rates of interest. It also acts as a government bank.

GOVERNMENT AND FINANCE. The president is elected for four years and cannot serve two terms in succession. Dr. Manuel Amador Guerrero, the first president, was succeeded in 1908 by José Domingo de Obaldia. The Chamber of Deputies consists of 32 members elected for four years. The country is divided into seven provinces, each under a governor appointed by the president. The revenues in 1907 amounted to \$2,439,302, derived principally from customs and excise. The expenditures were estimated at \$2,433,866. On June 30, 1908, the credit balance of the government was \$8,110,697, of which \$6,300,000 was invested in first mortgages on real estate in New York City, \$1,505,307 was deposited on current account in New York, \$250,000 deposited in the above-mentioned government bank, and \$55,390 was in the government treasury. The monetary unit is the gold balboa, equivalent to the American gold dollar. The peso, or half-dollar, and its subdivisions, are silver coins. There is a police force of about 1,000 men.

HISTORY. In the spring of 1908 Colombian troops occupied the town of Jurado. The Panamanians were indignant over what they regarded as a violent seizure of Panama territory, twenty-five miles from the Colombian boundary. On the other hand, it was reported that President Reyes, of Colombia, asserted that he was acting in accord with Mr. Root, the Secretary of State of the United States, and according to Washington despatches the opinion in American official circles was that Jurado lay four miles within the Colombian boundary line. In May, Mr. Taft, the American Secretary of War, visited Panama and had conferences with the representatives of Panama and Colombia. He succeeded in obtaining a tentative agreement between them. Panama consented to await the decision of the American government before taking any action in this matter.

Another matter which called Mr. Taft to Panama was the impending election for presi-

gent of the little republic. There were two candidates for the presidency, Ricardo Arias, Minister of Foreign Affairs, and José Domingo de Obaldia, one of the vice-presidents. During President Amador's absence in Europe, Señor Obaldia was acting president. He removed certain officials who were accused of dishonest practices and compelled others to turn over to the government money which, it was alleged, they had intended to appropriate for themselves. President Amador rescinded these actions when he returned from Europe and removed the governors of the provinces of Colon, Chiriqui, and Coela—in order, it was said, to further the candidacy of Arias. Both Obaldia and Arias were Conservatives. The Liberals, who include the negro element, endorsed Obaldia. The opponents of Arias charged fraud in the registration. A revolutionary movement seemed imminent. The United States government sent warships to Panama and Colon, and landed a special force of marines. It called the attention of the Panama government to the fact that "if fraud was permitted in the elections it would be likely to lead to violence and riot and insurrection, and that it would then be the duty of the United States to preserve order under the treaty and the constitution of Panama." The government of Panama thereupon agreed to appoint a commission with full power to investigate the complaints of all parties, the United States to join in this inquiry through any agents it might choose to appoint, who would have full power to investigate and report to the United States government. The head of the American commission, Richard Reid Rogers, general counsel to the Isthmian Canal Commission, reported in June that the irregularities in the registration were much exaggerated in the complaints, that all errors had been rectified and every citizen given an opportunity to register, and that the representatives of political parties summoned by him to a conference duly approved the voting lists as compiled in his presence on May 29. On June 28, the municipal elections took place. In Panama and Colon, where the colored element took a prominent part in the elections, the opposition made gains. In Bocas del Toro and Chiriqui the administration party was successful, and it also carried two out of three of the other provinces. The results were thus of a mixed character, but on the whole they were regarded as favoring the candidacy of Señor Arias. The latter, however, soon resigned his position as foreign secretary and publicly withdrew from the contest for the presidency on July 4. This withdrawal, he declared, was dictated by a patriotic desire to prevent the military occupation of the republic by the United States and to enable the re-establishment of a union of political parties." In the election, held on July 12, the supporters of Arias refrained from voting and the ballots were almost unanimous for Obaldia. In Panama, Obaldia received 1,000 votes out of 3,500 electors originally registered by both parties; in Colon he received 400 votes out of 1,000 originally registered. On Aug. 1 the electors met in the capitals of the provinces and officially declared the election of Obaldia as president, and of J. A. Arango, Dr. C. A. Mendoza, and J. M. Lambert as vice-presidents. The new administration assumed office Oct. 1, 1908. The members of the cabinet of the new president were as follows: Secretary of Foreign

Relations, José Augustin Arango; Secretary of Government and Justice, Ramon M. Valdes; Secretary of the Treasury, Carlos A. Mendoza; Secretary of Public Instruction, Eusebis A. Morales; Secretary of Fomento, José E. Lefevre.

The Congress met on Sept. 1. On Sept. 23 it passed a habeas corpus act, which was promulgated by President Amador two days later. The Congress authorized the president to contract with two prominent persons to write a history of the country from its discovery to the establishment of independence. The work is to be completed within two to four years and is to be subject to revision by a committee appointed by the Secretary of Public Instruction. Provision was made for the preliminary expenses of the work.

PANAMA CANAL. On Jan. 6, 1908, President Roosevelt issued an executive order defining the powers of the Isthmian Canal Commission and its chairman. This order was merely a comprehensive revision of existing provisions found in the executive order of Nov. 17, 1906, and in subsequent orders and informal amendments. The general duty of the adoption of plans for the construction and maintainance of the canal under the supervision of the Secretary of War, and subject to the approval of the President, was placed upon the commission, whose powers were made broad and comprehensive. The chairman was made the executive head, and the other members of the commission were charged with the duty of advising and assisting in the execution of the work of canal construction, and other matters pertaining to sanitation, betterment, supply, and equipment. The members of the commission are required to reside upon the Isthmus, except when on leave of absence.

During the fiscal year 1908 the membership of the commission continued without change. On Sept. 15, Mr. Jackson Smith resigned from the commission, and Lieut.-Col. H. F. Hodges, Corps of Engineers, U. S. A., was appointed to succeed him. The commission at the end of the year was composed as follows: Lieut.-Col. Geo. W. Goethals, Corps of Engineers, U. S. A., chairman and chief engineer; Lieut.-Col. H. F. Hodges, Corps of Engineers, U. S. A., assistant chief engineer; Maj. D. D. Gaillard, Corps of Engineers, U. S. A., division engineer of Central Division; Maj. William L. Sibert, Corps of Engineers, U. S. A., division engineer of Atlantic Division; H. H. Rousseau, C. E., U. S. N., assistant to chairman; J. C. S. Blackburn, head of the Department of Civil Administration; Col. Wm. C. Gorgas, Medical Department, U. S. A., head of the Department of Sanitation; Joseph Bucklin Bishop, secretary; Edward J. Williams, disbursing officer; and Walter W. Warwick, examiner of accounts.

In carrying out the reorganizations indicated above, the Panama Canal Zone was divided into three parts, each of which was formed into a division in the Department of Construction and Engineering, and assigned to a division engineer who reported directly to the chief engineer. The first division, known as the Atlantic Division, included the territory north of Tabernilla; the second extended from that point to Padro Miguel, being known as the Central Division, and the third, Pacific Division, extended from Padro Miguel to deep water in the Pacific.

CANAL EXCAVATION TO DECEMBER 31, 1908.

Dredges	11,822,006	

Grand total 59,773,179

In 1904, when the Americans took the canal from the French company, there was required for the construction of the canal on the plan adopted and in force in 1908, a total excavation of 174,666,595 cubic yards. At the end of the year, a little more than one-third of this amount had been excavated. The lock canal, which was being constructed, according to the general plan of the minority members of the International Board of Consulting Engineers, involved, in their opinion, a total excavation of 103,795,000 cubic yards, but changes in details of the plan occasioned greater excavation than was provided for in this estimate. On the other hand, the amount of filling for locks and dams was estimated to be 29,387,000 cubic yards, or about 7,000,000 cubic yards less than was estimated by the minority members, and there will also be required 5,015,400 cubic yards of concrete, which is an excess of 2,000,000 cubic yards over the estimate of the minority members. Excluding the \$40,000,000 paid to the French company, and the \$10,000,000 paid to the Republic of Panama, the final cost of the canal at the end of the year was estimated at \$297,766,000.

On Oct. 1, 1908, the total cost of canal construction had amounted to \$83,275,000. The largest single item of these classified expenditures was in the Department of Construction and Engineering, which involved the sum of \$51,512,000, of which \$24,210,000 had been expended between July 1, 1907, and July 1, 1908. For dry excavation, \$43,285,000, of which \$12,236,000 was chargeable to plant, had been expended, and for wet excavation, \$6,061,000, of which \$3,500,000 was chargeable to plant. The civil administration of the canal construction from May 4, 1904, to Oct. 1, 1908, had cost \$2,381,000, while sanitation in the same period involved an outlay of \$7,408,000. The classified expenditures, included in the grand total mentioned above, do not include advances amounting to nearly five millions of dollars made to the Panama railroad; the purchase of Panama railroad stock; services rendered and material sold to individuals and companies amounting to about \$2,500,000; and all material and supplies on hand not drawn from store. In addition to

these costs, since the United States assumed the property of the French Panama Canal Company in May, 1904, there was involved the purchase price to that corporation of \$40,000,000, a grant to the Republic of Panama of \$10,000,000 in gold, and of \$250,000 annually, beginning nine years after the exchange of the ratification of the treaty.

During the year the widening of the Panama Canal through Culebra Cut, so as to make the minimum width 300 feet at the bottom instead of 200 feet, was authorized by President Roosevelt. This change makes the entire canal for the nine miles of the Culebra Cut from Bas Obispo to Pedro Miguel locks 300 feet in width at the bottom and involves an additional excavation of 12,997,000 cubic yards, and an extra expense of about \$14,000,000. The additional material thus excavated was to be removed about equally from each side of the former centre line, except between Las Cascadas and Empire, where the increased excavation would be on the west side in order to avoid interference with the Obispo diversion, and from Enterprise to Paraiso, where it will be taken from the east side, cutting out a small angle in the old line opposite Cucaracha. The average cross section of the canal will show a width of 300 feet at the bottom, with nearly perpendicular sides and an elevation of 95 feet above sea level, at which point a berm, 40 feet in width, will be excavated on each side of the canal, and the slope above will depend upon the material in which the excavation is made. The Atlantic and Pacific entrances to the canal are to be 500 feet in width at the bottom, and through Gatun Lake and the small lake at Miraflores, the width of the channel will vary from 500 to 1000 feet.

Some modification also was required in the construction of the locks of the canal as the result of a memorandum submitted to the Secretary of the Navy, by the General Board of the Navy, under date of Oct. 29, 1907, setting forth "that the width of the locks as now fixed, namely, 100 feet, is insufficient for probable ships of future construction and that sound policy would demand an increase to a clear width of 110 feet." This suggestion was adopted by the Commission, as there was no insuperable obstacle to such a modification of the project, and it was duly approved by the president on Jan. 15, 1908.

When the lock type of canal, first recommended by the minority members of the Board of Consulting Engineers, and adopted by Congress in 1906, was designed, provision was made for a flight of three locks at Gatun, two locks at La Boca, and one at Pedro Miguel. The locks at La Boca were placed on the west side of Sosa Hill in order to overcome the differences of level between the ocean and the lake formed by the Sosa-Coroza and the Sosa-San Juan dams. A beginning was made to construct the Sosa-Coroza dam by dumping material from Culebra Cut by a trestle. This was found impracticable, owing to failure of the trestles and the movement of the ground overlying the rock. Examination showed that this consisted of an unctuous blue clay without grit, with little supporting power, instead of a stiff clay, as originally believed. Beneath this the depth of rock varied from 10 to 70 feet, and the construction of the dam consequently on the

original lines, would have involved a greater length of time and expenditure than had been estimated. Accordingly it was determined to modify the original plan by building one lock at Pedro Miguel, two at Miraflores, and in addition there was the military consideration that locks further inland would be less liable to destruction by bombardment or from attack by an enemy. The Commission duly recommended the change, and this was approved by President Roosevelt on Dec. 19, 1907.

At the Gatun locks, where a twin flight of three locks communicate between the Caribbean portion of the canal at sea level and the Gatun Lake, at the end of the year 1908, 2,789,734 cubic yards, or more than one-half of the excavation, had been completed, and active work on the concrete plant and the power house was under way. In constructing these locks about 2,250,000 barrels of cement were estimated as required for concrete work, of which about 2,000,000 cubic yards were to be laid. The stone for the concrete was to be quarried and crushed at Portobello, a harbor of the Caribbean Sea, about 15 miles east of Colon, and towed in barges to Cristobal and by the old French canal to the new Gatun docks. Sand will be obtained in similar fashion from the village a few miles east of Portobello. Sand, rock, and cement will be handled by gravity and electric cars for delivery to and from the mixers, while a system of cableways stretching across the lock chambers will transport the concrete from the cars to the points desired. It was estimated that the entire plant would be ready for work by July 1, 1909.

One of the most important, if not the most important, engineering undertakings at the isthmus was the Gatun Dam, work on which was begun on Dec. 24, when a 20-inch suction dredge was set at work pumping sandy clay from a point 2,000 feet north of the dam site into the channel of the old French canal. The dam will be about $1\frac{1}{2}$ miles in length, with a space of 1,200 feet in width between the rock toes. The top of the dam, according to the adopted plan, was to be 135 feet above sea level, and the lowest level of water impounded in Gatun Lake was to be 85 feet. The plans selected for the Gatun dam involved an earth dam that was a combination of rock fill and hydraulic fill, where the exterior faces were to be composed largely of rock of all sizes brought from the canal excavation, dumped and laid on slopes much flatter than ordinarily would be found in earth dams. The interior of the dam was to be formed largely by clayey material obtained by hydraulic dredging from large deposits a short distance from the dam and carried by water through pipes to the places where it was to be used. This material, as delivered, would be a mixture of earth and water. The solid material thus brought to the dam site was to be slowly deposited and gradually form a solid water-tight embankment. As there would always be a certain amount of water in the nature of a pond on the top of the dam, there would be consequently a constant test of the embankment at all stages of its growth, so that any weak points might be detected and voids or cracks filled. The nature of the material was considered the only point of the dam subject to question. The clay soil, though generally impervious to water, it was

feared might slip and slide when subjected to heavy, unbalanced pressure, or on high, steep slopes slip when saturated with water. In other earth dams sandy and gravelly materials had been employed, and this radical difference of material made necessary the most serious investigation and consideration by the engineers. It was decided, however, that with a greater thickness at the bottom, amounting as it did in the Gatun dam to more than a third of a mile in horizontal thickness at its base, and including the rock-fill portion, stability and permanency would be assured.

By the end of the year, a toe of Bas Obispo rock had been built from a point near the lake site to the spillway on the south side, and a similar toe had been built on the north side at a distance of 1,200 feet. The dam was to be formed by pumping material into the space between these two toes. The total fill to be made was estimated at 21,000,000 cu. yards, and each of the two dredges which were to be put to work was considered able to deliver 150,000 cubic yards of material a month or over 5,000,000 cubic yards in a year. In making the dam, the surface soil was first to be removed, and in the channel of the old French Canal, which was being filled at the end of the year, the surface soil was being washed down until a suitable foundation for the hydraulic fill could be prepared. Sheet-piling sunk down into impermeable material clear across the valley along the axis of the dam was being employed, and a water-tight core was being constructed below the bottom of the hydraulic fill. An essential feature of the project was to divert the Chagres River through the spillway and this was to be done as soon as the concrete work in the spillway had been completed above the high water line.

The spillway extends through a small hill that rises in the middle of the dam site, and at the end of the year the excavation along the north section had been practically completed by active steam shovel work. The channel thus formed was to be lined with concrete, and heavier masonry was to be erected at the regulating works, and extend south, forming part of the spillway channel and the entrance to it. In constructing this spillway over 250,000 cubic yards of concrete will be required, and each wall will be 8 feet thick at the top of the floor, and on the back will rise in four steps to a thickness of three feet at the top. Great concrete monoliths 40 feet long by 20 feet wide will be laid, and the heaviest parts of the frames for the walls will weigh 4,800 pounds, being handled by a locomotive crane operating in the spillway on tracks parallel to the sides. Large concrete handling and mixing plants for the spillway and for the locks were being erected and at the spillway alone 500 cubic yards of concrete will be handled each day.

At the Gatun Dam, careful and extensive investigations in addition to those at the lock sites described below, were deemed necessary to ascertain the ability of the underlying material to support the proposed structure, and during the fiscal year tests were carried on. A test pit, 12 feet square, was sunk in the hill through which the spillway was being carried, and near its head, and this was carried down to about 35 feet below sea level. It revealed the fact that the rock formation was practically the same as at the lock site. In addition, a num-

ber of wash borings and a test pit of 20 feet square on Gatun Island was sunk to a depth of 68 feet below sea level. Examinations made of the spillway, in the opinion of the Commission, indicated that the rock has sufficient strength to bear safely any of the loads that would be placed upon it when suitable precautions were taken to cut off the flow of underground water. Two experimental dams on the scale of one inch to the foot were made, according to the designs adopted for the regular structure, and various tests of these showed not only the suitability of the material available in the neighborhood for the construction of the dam, but the fact that a stable and watertight dam could be built by hydraulic methods.

The Gatun Dam, both as regards its site and design, was criticised by the lay press and by a few engineers, especially those favoring a sea-level canal. It, however, was ably defended, among others, by John F. Stevens, former Chief Engineer of the Isthmian Canal Commission, who stated that the long down-stream toe of the dam, planned by the engineers, and its extreme height, were considered concessions to prejudice, and that under private enterprise, a far less massive structure would have been built and considered absolutely safe. Indeed, it was the consensus of the best engineering opinion that the plan and execution of the canal was being carried on systematically, efficiently, and economically. It was remarked, however, that necessary data, even for engineering critics, were not available except in the reports of the Commission, and that a careful study of these by technical men, and others interested, seemed to demonstrate the efficiency of the work. Some criticism was directed to the undue cost and the excess of expenditures, present and future, over original engineers' estimates, but it was stated in reply that no adequate knowledge of the underlying conditions had been possessed by the engineers who originally estimated on the work, and that its importance was developing with time, and justifying an outlay far greater even than was anticipated.

During 1907 and 1908, an interesting and careful examination of the foundations for the locks at the Gatun Lake was made, as some doubt and criticism had been made of the erection and as to the permanence of these massive structures. The material encountered consisted of a layer of argillaceous sandstone, overlying a layer of conglomerate which was composed of pebbles and other hard aggregates held together by a cementing material, and which was sufficiently hard in texture to require blasting for its removal. Then came a soft sandstone, consisting of sand with some cementing material which disintegrated under erosion. At the upper end volcanic tufa with scattering pieces of argillaceous sandstone was found, the proportion of tufa in this stratum diminishing toward the lower or north end of the site. Below this layer was dense argillaceous sandstone of considerable thickness. The presence of ground water was discovered by borings and as this was under pressure, it brought up interesting considerations. While the volume of water encountered was small, some provision was necessary to prevent its flow through the softer material, upon which the part of the wall would rest, and plans were devised whereby access to the foundation of this water would be prevented by curtained walls connected with the underlying impervious strata

of argillaceous sandstone. In the opinion of the Commission there was no question that the various materials would sustain the greatest loads that would be transmitted to them by the lock cells if provision were made to prevent the underground flow of water through the softer materials on which part of the walls would rest.

It will be remembered that the Gatun Lake, through a channel in which ships are to pass, is at a level of 85 feet above the sea, so that vessels must pass by a single flight of twin locks at Pedro Miguel and a double flight of twin locks at Miraflores to the level of the Pacific Ocean. The Pedro Miguel locks are $10\frac{1}{4}$ miles from the end of the canal, in the deep waters of Panama Bay, at a point where the Rio Grande River valley is about half a mile wide and enclosed on every side by hills. At the north end or beginning of the lock, the east wing wall will extend to the hill on the east, and a dam will be built from the west wall of the lock to the hill on the west side, for a distance of 1400 feet. This dam, at the end of the year, was under construction, and was being built of earth, with a clay core and rock toes. It was to be 40 feet wide at the top and have slopes of 4 to 1. The Pedro Miguel locks will consist of two parallel chambers of concrete, each 1000 feet in length, 110 feet wide, and with not less than $43\frac{1}{2}$ feet of water over the sills. The gates will be of the mitre type, operated by electricity from the hydraulic power plant at Miraflores. About 800,000 barrels of Portland cement will be used in the concrete work of the lock chamber and the approaches, and over 800,000 cubic yards of concrete will be laid. It was estimated that the excavation, well under way in 1908, would be completed by August, 1909, in order to enable the laying of concrete to commence on that date. From the south end of Pedro Miguel lock and the north end of the Miraflores lock is a distance of 1.6 miles, and the excavation for this part will require the removal of only 1,100,000 cubic yards of material to form a channel 45 feet deep and 500 feet in width, running through a lake formed by the water held back by the Miraflores dam. This lake will extend across the valley to a 55 foot level and will be $1\frac{1}{2}$ square miles in area. From the Pedro Miguel-Miraflores lake ships will be dropped from elevation 55 to sea level by two flights of locks at a point $8\frac{1}{2}$ miles from deep water in Panama Bay. The locks at Miraflores are designed of the same construction as those at Pedro Miguel, differing in a double step at Miraflores instead of a single step, as at Pedro Miguel. They also are located in the valley of the Rio Grande, but as their bottoms will be 20 and 52 feet respectively below sea level, a greater amount of excavation is required. Also the dams will be longer as the valley at this point is wider, and the east dam running from the upper end of the locks to Miraflores Hill will be 800 feet in length and will require 200,000 cubic yards of excavation and 63,500 yards of concrete. The spillway for the lock will be at this dam, and the water wasting into the Rio Grande valley will furnish power for the electric plant. An earthen dam, under construction across the Cocoli River, which crosses the lock site and runs into the Rio Grande, was making rapid progress at the end of the year.

The construction of the lock type of canal, involving as it does the overflow of the exist-

ing roadbed, caused the relocation of the Panama Railroad, and between Mindi and Corozal it was found necessary to carry the roadbed east of its present location at a level of about 10 feet above the normal surface of the lake. A beginning was made with the construction work along the new line.

BAS OBISPO EXPLOSION. On Dec. 12th the most serious accident that had occurred in the entire construction of the canal took place, when a premature explosion of dynamite in the cut at Bas Obispo resulted in the death of 23 employees of the Commission and the more or less serious injury of about 40 employees, mainly Spanish and negro laborers. The cause of the accident was not definitely determined, but it was believed to be accidental and not due to negligence on the part of those engaged in the blasting, as elaborate rules for the storage, transportation, handling and use of explosives had been promulgated by the Commission and were efficiently observed. When it is realized that practically a million pounds of dynamite a month is delivered for blasting work in connection with the canal operations, its extent readily can be appreciated. The explosion threw down a mass of rock estimated at 55,000-60,000 cubic yards to lower levels, filling the last three cuts which had been made by the steam shovels. During the year 1908 there were six accidental explosions of dynamite on the canal work where one or more fatalities occurred, and in this time one million charges were exploded, one-third of which were in holes.

GOVERNMENT OF THE CANAL ZONE. In the government of the Canal Zone there were no striking events of importance during the year. Satisfactory relations with the Republic of Panama, and foreign representatives, were maintained, and the results of congressional legislation affecting the Canal Zone were most beneficial. By action of Congress, the Employers' Liability Act, an act providing for the compensation of government employees injured in the performance of duty, was extended to the Zone. By executive order, the Chinese Exclusion Law of the government of Panama came into effect in the Canal Zone, and trial by jury was provided for criminal prosecutions, where the penalty by death or life imprisonment might be inflicted. At the ports of Ancon and Cristobal, 412 vessels, aggregating 817,863 tons, entered. No duties or customs fees were collected. On June 30, 1908, there were 1081 leases in force, covering building lands, buildings, and agricultural lands, from which the revenue derived was \$17,436.76, and on account of distillation, liquor licenses and fees from bonding companies qualified to do business in the Canal Zone, \$44,743.96 were collected. The general tax and license receipts was \$77,467.47. At the close of the year the police force consisted of 232 men; there were 6075 arrests and 4731 convictions, 98 of which were felonies. Schools were maintained for white children at 11 places, in which 721 pupils were enrolled, and for colored children at 15 places, with an enrollment of 2146. At the beginning of the fiscal year there was \$144,358.09 in the Zone treasury, and \$283,906.17 were collected during the year, and \$183,501.95 expended, so that the balance on hand at the close of the year was \$244,762.31. Of the money expended \$47,175.03 were for public works and improvements; \$35,-

749.47 for the maintenance of public schools; \$99,673.21 for the postal service, and \$904.24 for contingent and miscellaneous expenses. The good record maintained by the Sanitary Department continued during the year. With an average of 43,057 men on the pay roll, the death rate per thousand was 18.32 or less than that of the previous year. With the white force the death rate was 15.34, and for the blacks, who averaged 30,999, the death rate was 19.48, or a decrease of over half that of the previous year. This was due, not only to better sanitation, but largely to better food.

PAN ANGLICAN CONFERENCE. See ENGLAND, CHURCH OF.

PAPER. The paper industry in 1908 was occupying a very large place in public interest on account of its connection with a number of important matters. For the manufacture of paper large quantities of wood pulp are required annually, so that there is involved a steady drain on the forests with the result that not only was their possible exhaustion feared, but the effect on climate, water supply and the general welfare of the people in a not distant future was pointed out by those interested in the policy of conservation. Then the demand of the daily press for large quantities of paper had made it possible for manufacturers to put prices at what was considered by consumers an unduly high figure so that publishers were at the mercy of manufacturers or combinations of manufacturers. In fact this was so important that a committee of the House of Representatives, known as the Mann Committee, from its chairman, spent a large part of the year investigating the paper industry, taking much testimony and examining plants both in the United States and Canada. No report had been issued up to the close of the year. Likewise paper figured in the hearings of the Ways and Means Committee on the proposed revision of the tariff, but here also no indication of policy was made, though naturally the trade was greatly interested and concerned. But the main point was that all of these matters must be considered in the light of many interests and policies as the questions were indeed fundamental. The paper industry figured in one of the prosecutions under the much-discussed Sherman Anti-Trust Law, and the Fibre and Manilla Association, commonly called the Parks Pool, from its organizer, was duly investigated. After an indictment had been found by the Federal grand jury against the corporations and firms composing the pool for forming a combination in restraint of trade, the various members, with the exception of Mr. Parks, who was in Europe, pleaded guilty, and were fined \$2000 each. During the year there was a serious strike in the paper industry, which was extended sympathetically until it embraced a number of corporations. It began with the employees of the International Paper Co., but soon spread to the Great Northern Paper Co., the St. Croix Paper Co., the Cliff Paper Co., the Pettebone-Cataract Paper Co., and other works. The strike lasted from the beginning of August until almost the middle of November, and resulted in a defeat for the workers, who returned to work as individuals without the recognition of the unions. Trade conditions during the year were influenced by a number of external causes. Thus the general

shortage of water had a serious effect and prevented many of the mills running to their fullest capacity when business had begun to pick up. In fact a lack of water was felt throughout the year and resulted in a decreased output of pulp. While business was slack in the early part of the year, yet it improved, and with the decreased output caused by a strike, stocks of paper were gradually wiped out, and even Scandinavian pulp was imported. At the end of the year the situation was reported as regards pulp not as a question of price, but of getting pulp.

In connection with the conservation of the nation's forests it is worthy of mention that the International Paper Company, which owns about 900,000 acres of timber lands, decided near the end of the year to limit the amount of the cutting to the annual growth, and the department of forestry, which was in charge of Charles F. Griffing, was directed to put into effect a practical plan of forestry which would have as its object the conserving of the wood by using the most economical methods of cutting and to carry on all operations so as to minimize the danger of fire.

During the year there appeared an interesting review of the paper industry of the world prepared by Franz Krawany, director of the Paper Union of Vienna. In the statistical summary it was stated that the total annual production of the world amounted to 8,000,000 tons, of which 55 per cent. was produced in Europe, divided by percentages as follows: Germany, 17 per cent.; England, 11 per cent.; France, 7 per cent.; Austria-Hungary, 5 per cent.; Russia and Finland, 3½ per cent.; Sweden, 3 per cent.; and Norway, 1½ per cent. The remaining 43 per cent. was credited to America, and the United States was responsible for nearly 40 per cent., and Canada for almost 3 per cent. As regards consumption, the annual average for Europe per capita is 10 kilograms (1 kilogram = 2.2 pounds.) England has a per capita consumption of 25 kilos, Sweden 24 kilos, Germany 19¾ kilos, Norway 16 kilos, Switzerland 15 kilos, Austria and Belgium 11 kilos, France 14 kilos, and so on to the less civilized countries. Canada stands at the head of the list of consumers with 28¼ kilos, while the United States is fourth with 22½ kilos. The total number of paper machines in the world, including board machines, was estimated at 9109, distributed as below. The average production per machine depends, of course, upon the class of paper, the width of machine, and the speed at which it is operated. It is shown in the accompanying table.

Country	Number of Machines	Average Production per Machine
United States.....	1051	Tons 2830
Canada	394	2670
Norway	79	2230
Finland	Number not given	1760
Sweden	227	1680
England	558	1610
Germany	916	1390
Austria-Hungary ...	282	1380
Belgium	Number not given	1250
Russia	separately	1070
France	539	1050
Italy	566	460

In this discussion the statement was made that if the population of the world and the consumption of paper should increase in the ten years after 1908 at the same rate, at the end of that time there would be required 1000 additional machines and that the world's production will have been increased by 25 per cent. Now, the interesting question was, will this calculated increase be restricted by a deficiency of the raw material, especially wood pulp? The world's annual production of mechanical wood pulp is roughly 3,500,000 tons; that of chemical wood pulp and straw pulp, 3,250,000. Therefore, it is easy to understand the efforts and experiments that were being carried on to find new fibres for use in making paper. In its annual review of the world's paper industry for 1908 *The World's Paper Trade Review*, in a critical discussion of the progress made during the year with new fibres, after discussing them individually, concludes: "Notwithstanding the advancing price of wood, and the depletion of the world's forests, wood pulp on account of its comparatively low cost makes a suitable substitute difficult to find, especially when such necessary items as planting, cutting, drying, packing, shipping and freight are taken into consideration." Even more interesting is a report issued during 1908 from the U. S. Department of Agriculture on "Paper Making Materials and Their Conservation," Circular 41, Bureau of Chemistry, prepared by F. P. Veitch, chief of the leather and paper laboratory. According to this report the growing demand for paper making materials may be supplied by a more conservative use of those which have been shown to be well suited for the purpose which thus used are ample in supply to meet normal requirements for many years. Especially larger quantities of waste textiles and papers should be used for paper making, as some 2,000,000 tons of such wastes, worth approximately \$30,000,000, could be saved in the United States annually. This material would make 1,700,000 tons of paper, and the amount of wood required annually for paper making could be reduced to about 2,000,000 cords. In regard to the large quantities of cultivated and wild straws and grasses and flax fibre available for use in paper making, the report states that economic agricultural considerations indicate that the cultivated straws should only be thus used when the woods and textile and paper wastes can no longer supply the demand or are too costly. Flax fibre when it can not be put to more important uses is available for paper making and should be used. "Finally, when all of these supplies are no longer adequate and when economic conditions are such as to justify such innovation, there are suitable quick-growing materials which may be produced primarily for paper making." In another government research the availability of corn stalks for paper making was shown and this will be found discussed under CHEMISTRY, INDUSTRIAL.

PAPUA, TERRITORY OF. Formerly known as British New Guinea, a colonial possession of the Commonwealth of Australia. Including the southern and southeastern portion of the island of New Guinea, the D'Entrecasteaux and Louisiade groups, and other islands, the total area is about 90,000 square miles, and the total population about 350,000 (600 Europeans). Port

Moresby, the capital, has 1600 inhabitants (100 Europeans). The existence of a vast mountain range, extending through British, German, and Dutch New Guinea and containing some of the highest peaks outside of the Himalayas and the Andes, has been recently established. Gold is produced. The Astrolabe copper field covers an area of 1000 square miles. The forests contain ebony, sandalwood, cocoanut and sago palms, and yield rattans, rubber and gums. Tobacco and coffee are produced. Towards the end of 1908, J. H. P. Murray, chief judicial officer of Papua, was appointed Lieutenant-Governor, and Stamford Smith, Administrator.

PAPYRUS, DISCOVERIES OF. See **ARCHÆOLOGY.**

PARAGUAY. A republic of South America. Area, 97,722 square miles; population (1905), 631,347, a mixed race of Spanish, Indian, and negro origin, including 50,000 Indians. The number of immigrants in 1906-7 was 1226. The principal cities, with their estimated populations are: Asuncion, the capital, 60,259 (1905); Villa Rica, 25,000; Concepcion, 15,000; Carapegua, 13,000; Paraguari, 10,000; Villa del Pillar, 10,000.

EDUCATION. The primary schools are under the direction of the national board of education. In 1907, there were 383 primary schools, with 698 teachers, and 39,749 pupils—an increase of 10,000 over the previous year. The government maintains five colleges, corresponding to American high schools, at Asuncion, Villa Rica, Concepcion, Villa del Pillar and Encarnacion. In 1907, they had 62 teachers and 615 students. The normal training school for teachers had 58 teachers and 119 students. The national university, founded in 1899 at Asuncion, has faculties of law and social science, medicine and pharmacy; in 1907 there were 52 professors and 194 students. The national college of agriculture, with an experimental farm attached, is situated a short distance from Asuncion. About twenty students are maintained by the government in Europe and the United States. At Asuncion there are four large private schools, two of them under ecclesiastical direction.

PRODUCTION, COMMERCE, ETC. The greater part of the soil has been alienated by the government to capitalists, syndicates, and foreign bondholders, and is mostly uncultivated. Quebracho logs and extract are the most important forest products. About 4200 pounds of rubber were exported in 1907. Excellent cotton is grown. The most important products are *yerba maté* (Paraguay tea), the cultivation of which is carried on by capitalists and companies, oranges and tobacco. Other products are maize, alfalfa, beans, manioc, mandarins, etc. Cattle rearing is the most important industry, and jerked beef and hides are exported. In 1907, the imports amounted to \$7,861,273, and exports, \$3,236,109. Both branches of the foreign commerce show a gain over the preceding year, the gain in imports being over \$1,500,000, and in exports over \$500,000. About half the value of the imports is from Great Britain, consisting chiefly of cotton goods, groceries, provisions, spirits, drugs and hardware. Germany ranks second on the import list, furnishing rice, groceries, hardware, machetes, guns and ammunition, stationery, etc. France supplies wines and from Italy are very much of the same nature—spirits, sugar, perfumery, etc. The imports

as from France. From the United States a small amount of agricultural machinery, machetes, axes, kerosene oil and leather is imported. The principal countries of export are Argentina, \$1,850,610; Germany, \$566,700; Belgium, \$268,650; and Uruguay, \$475,624. In 1908, both imports and exports fell off, and while there were but few business failures, most of the large concerns were obliged to ask for extensions of credit. Money was scarce and exchange was quoted in September, 1908, at 1400 per cent. There are about 674 commercial houses in Asuncion, nearly all in the hands of Germans, French, Italians and Spaniards. Of British houses there are only two. In the country districts, there are 1728 firms of various nationalities. The government promotes native industries and immigration. An Italian colony has been established near Asuncion, and the introduction of Asiatic coolie labor on the rice, sugar and tobacco fields was being considered. The length of railway in 1908 was 154 miles; of telegraph lines in 1907, 1966 miles.

FINANCES, ETC. The budget of 1908 estimated the revenue at 2,567,000 gold pesos and 6,080,000 paper pesos, and the expenditure at 389,037 gold and 30,008,806 paper pesos (1 gold peso = \$1,034). The public debt consists of the British debt, which stood on Dec. 31, 1907, at 4,139,449 gold pesos; the Argentine debt, 12,435,500 dollars in 1904; the Brazilian debt, 9,876,500 dollars in 1904; and paper money, 35,000,000 pesos in 1908.

ARMY. The army, which is a sort of internal police force, is recruited by voluntary enlistment and consists of 1161 officers and men of infantry, cavalry, and artillery. General Benigno Ferreira assumed office in December, 1906. In July, 1908, he was displaced by Dr. Emiliano G. Naveiro.

HISTORY. In his message to the National Congress of April, 1908, President Benigno Ferreira stated that the foreign relations of the country were satisfactory. The government participated in a number of international conferences. Extradition treaties were negotiated with several European governments. The arbitration treaty with Peru was submitted for the approval of the Congress. With Brazil and Spain arbitration treaties were under consideration. The boundary question with Bolivia was on the point of adjustment through the good offices of the Argentine government. Internal conditions were also a cause for congratulation. Both customs and internal revenue receipts showed an increase over the preceding year. Agricultural prospects were good, and although there was a decline in the price of hides and the lumber industry underwent a temporary cessation, yet financial interests did not suffer.

On July 2 a revolution broke out in Asuncion. For two consecutive days the revolutionists bombarded the government troops in the buildings in which they had taken up positions. The number of killed in the streets of Asuncion was estimated at 400 or 500, the wounded numbering as many. On July 4, the revolutionists were triumphant, and President Ferreira resigned. He was succeeded by Vice-President Dr. Emiliano G. Naveiro. The former President and his ministers took refuge in the foreign legations. The diplomatic corps appealed to the revolutionists to spare the lives of these officials, and their appeal was granted. By the middle of July the

new government was generally recognized.

It was reported that the Argentine government had aided the government forces against the revolutionists, while the Brazilian government sympathized with the latter. During the fighting Argentine gunboats sailed up the river to the capital, ostensibly to protect the foreign legations.

PARSONS, FRANK. An American educator and author, died on September 26, 1908. He was born at Mount Holly, N. J., on November 14, 1854, graduated in mathematics and engineering at Cornell in 1873, and after being employed as an engineer, studied law, and was admitted to the bar in Boston and practised law there. In 1892 he was appointed lecturer on law at Boston University, and he was professor of history and political science at Kansas Agricultural College in 1897-1900. He had also served as professor of political science and dean of the College of Liberal Arts in Ruskin University, Missouri, and as director of the Bureau of Economic Research, Washington. Professor Parsons made a special study of railroad ownership and operation, both in Europe and this country, and in 1901-02 was called as a witness before the United States Industrial Commission on the public ownership of railroads, telegraphs, and telephones. His publications include *Our Country's Need* (1894); *The Drift of Our Time* (1898); *The City for the People* (1900); *Direct Legislation* (1900); *The Bondage of the Cities* (1900); *The Story of New Zealand* (1904); *The Heart of the Railroad Problem* (1906); *The Railways, the Trusts, and the People* (1906), and *History of Railway Discrimination in the United States* (1906).

PASTOR, ANTONIO. An American theatrical manager, died on August 26, 1908. He was born in New York City, about May, 1835, and made his first public appearance at the age of 6, singing at a temperance revival meeting. In 1843 he was featured as a "child prodigy" at P. T. Barnum's Museum. After several years spent with various travelling circuses and minstrel shows, he appeared as a singer at the Bowery Music Hall, New York, in 1859. He was manager of a concert hall in the same city, from 1861 to 1865. He opened a variety theatre on the Bowery in 1865, and managed it successfully until 1875, when he established one on Broadway. In 1881 he opened Tony Pastor's Theatre, in Tammany Hall, East Fourteenth Street. He managed this continuously up to the time of his death. Pastor was the originator of modern vaudeville. Many of this country's most successful comedians and variety actors made their first appearance under his management.

PATENTS. See UNITED STATES, paragraph *Patents*, and under GREAT BRITAIN, *New Patent Law*.

PATRIOTIC SOCIETIES. Those organizations have as their object the preservation of the records of important events in history, and especially of the wars in which the United States has participated, the encouragement of love of country, the saving and restoration of historical sites and objects, the celebration of anniversaries of historic events, and the fostering of fraternal feeling and intercourse among veterans.

Of these societies the most important are the following: The Society of the Cincinnati, founded in 1783, membership in 1908, 842, Presi-

dent-General, Hon. Winslow Warren; Sons of the Revolution, founded in 1776, membership in 1908, 7560, General-President, John Leo Carroll; Sons of the American Revolution, founded in 1889, membership in 1908 about 11,000, President-General, Henry Stockbridge; Grand Army of the Republic, founded in 1866, membership in 1908, 225,157, Commander-in-chief, Henry M. Nevins; Sons of Veterans, founded in 1879, membership in 1908 about 50,000, Commander-in-Chief, Edgar Allen, Jr.; United Veteran Legion, founded in 1884, membership in 1908, about 20,000; General Society of Mayflower Descendants, founded in 1894, Governor-General, Samuel B. Capen; Huguenot Society of America, founded in 1883, President, Col. William Jay; Society of Colonial Wars founded in 1892, Governor-General, Arthur J. C. Sowdon; Order of Founders and Patriots of America, founded in 1896, Governor-General, Col. R. S. Woodruff.

The most important women's patriotic societies are: Colonial Dames of America, founded in 1890, President, Mrs. Edward King; Daughters of the American Revolution, founded in 1890, membership, 55,780 in 1908, President-General, Mrs. Donald McLean; Daughters of the Revolution, founded in 1891, President-General, Mrs. Frank E. Fitz; Dames of the Revolution, founded in 1896, President, Mrs. Montgomery Schuyler.

There are several patriotic societies of Spanish War veterans and of veterans of the Confederate army and their descendants.

The forty-second annual encampment of the Grand Army of the Republic was held at Toledo, Ohio. The following officers were elected: Henry M. Nevius of Red Bank, Commander-in-Chief; J. Kent Hamilton, Senior Vice-Commander-in-Chief; Charles C. Royce, Chico, California, Junior Vice-Commander-in-Chief; Frank O. Cole, Adjutant-General; B. R. Stowits, Buffalo, N. Y., Quartermaster-General. The headquarters of the Grand Army are established at Red Bank, N. J.

The Sons of the Revolution have established headquarters for the New York State Society at Fraunces Tavern in New York City, which is under their supervision, and under their direction has been reconstructed and made a patriotic memorial. The Tavern was visited by many people during the year. The Long Room and Museum are objects of special interest, and arrangements have been made so that these rooms are practically open to the public at all times during the year.

The Daughters of the American Revolution are constructing a Memorial Continental Hall in Washington, which was nearing completion at the end of 1908. This Hall is to cost \$500,000, and is intended to be a memorial to Revolutionary heroes and heroines, and a place for meeting for the transaction of business in the present day. The Society during the year dedicated an arch to the memory of Revolutionary soldiers and pioneers at Johnstown, N. Y. Fort Masack in Illinois is to be preserved by the Society as a park, and a fine monument has been erected to George Rogers Clark by the Daughters of the American Revolution of Illinois. A suitable memorial was placed at Allentown, Pa., in memory of Jacob Mickley and others. The Society of Colonial Wars dedicated a monument to the memory of Lord Calvert in Baltimore during the year.

PAULSEN, FRIEDRICH. A German philosopher of the Neo-Kantian school, died on Aug. 14, 1908. He was born in Langenhorn, on July 16, 1846, and was educated at Erlangen and at Berlin, where he was appointed docent in 1875, and in 1896, professor of philosophy and pedagogy, a chair he held at the time of his death. Dr. Paulsen was one of the most popular lecturers in Germany. He published an important genetic study of the Kantian system, *Versuch einer Entwicklungsgeschichte der Kantischen Erkenntnisstheorie* (1875), with a supplemental work, *Immanuel Kant* (1898: English translation by J. E. Creighton and A. Lefevre, 1902); also: *Kant der Philosoph des Protestantismus* (1899); *Schopenhauer, Hamlet und Mehistopheles* (1900); and *Ethik* (1889, partial English version, 1899) which has a valuable historical sketch, and treats from a practical viewpoint the morality of every day life and politics. On educational topics he wrote *Geschichte des gelehrten Unterrichts auf den deutschen Schulen und Universitäten* (1885), and *Höhere Schulen und Universitätsstudium im 20. Jahrhundert* (1901).

PAVEMENTS AND ROADS. The general status of pavements continued in 1908 largely as in the years preceding. Sheet asphalt, wood blocks treated with a preservative and brick were the leading paving materials where smoothness, cleanliness and a minimum of noise are sought. The best stone blocks are more durable than the three materials named, particularly where the traffic is heavy, but stone pavements are rougher, noisier and less easily cleaned than asphalt, wood or brick and are also expensive in first cost. Concrete blocks were used in a number of cities in 1908, with considerable promise of success. They can be readily made in any desired size and can be given a smoother surface than is possible with split stone blocks. Bituminous macadam continued to gain in favor and use for city streets of moderate traffic, and with the dust and destruction which the automobile was causing on country roads, bituminous macadam was finding a place there as well. Ordinary macadam, while not always classed as a pavement, made up a large percentage of the surface of improved streets in many large cities and was the principal material used in the smaller cities and towns in America, and also in many European countries. The relative areas of stone, wood, asphalt and macadam pavements in Paris and New York City on Jan. 1, 1908, as given in a paper by Mr. Lewis, mentioned below, was as follows:

	Paris	New York
Stone	6,726,000 sq. yds.	8,380,000 sq. yds.
Wood	2,464,900	287,800
Asphalt	495,200	13,901,530
Macadam	1,399,500	9,684,500
Totals	11,085,700 sq. yds.	32,254,600 sq. yds.

Asphalt was introduced into Paris as long ago as 1855, and wood did not get a good footing until 1881 (owing to the failure of earlier wood pavement, due to improper material or construction), yet, wood is far more extensively used in Paris than is asphalt. The asphalt there, however, is made from a natural con-

dition of asphalt and limestone. Such pavement is known as rock asphalt, and is harder and slipperier than the asphalt pavements of American cities, to form which a relatively pure asphalt is mixed, hot, with powdered limestone and other materials, in proportions shown by long general experience and also by local tests to give the best results. The wood blocks used in Paris are of soft pine, treated with creosote in a large plant owned by the city.

ROADS. State aid in highway construction and maintenance is gradually spreading through the United States. The aid includes actual construction and repair by the several States, the counties and towns concerned paying a portion of the cost; and advice and other assistance by State officials is also rendered. In New York State the expenditure of \$50,000,000 is being distributed over a period of ten years, State bonds being issued from year to year. The sum named will be largely increased by the amounts contributed locally. Highway construction and maintenance procedure in New York State was revolutionized in many particulars, extended in others and systematized throughout by the Legislature of 1908 (Laws, 1908, Chap. 330). Enactments of the past 110 years were consolidated and revised. The time-honored and much-abused labor system (taxpayers "working out" their highways taxes under the direction of "district" superintendents) was abolished, as of Jan. 1, 1909, and the money system set up in its place. Hereafter town superintendents will be responsible for all local roads. Certain country roads, improved at the joint expense of the town (15 per cent.), the county (35 per cent.), and the State (50 per cent.), and all State roads (whole cost of improvement met by the State) will be in charge of a State Highway Commission of three members, one of whom must be a civil engineer. County superintendents to have general charge of all bridges and highways, are to be appointed by county boards of supervisors, or, on failure so to do, the State Highway Commission must appoint district superintendents instead, forming one or more counties into a district with a maximum of 5000 miles of roads. The State bond issue already mentioned was to be divided hereafter between State and county roads, not over half of the appropriation of any one year to go for State roads. The statute named specified 37 routes for roads to be built wholly at State expense and to form a network of main or through highways over the whole State. The county roads improved under this act were to be so chosen as "to constitute a properly developed system of improved market roads within the county." The initiative for such road improvements lies with the county authorities. County supervisors may construct or improve highways located in one or more towns and divide the expense between the towns, or the towns and the county, as the supervisors see fit. Once improved, the maintenance and repair of both State and county roads is to be under the control of the State Highway Commission. Towns must contribute \$50 per year per mile of improved State and county roads within their limits towards the repair of such roads.

The subject of road construction and maintenance, with particular regard to securing roads that will resist the wear and tear of automobiles and that will not give rise to intoler-

able dust, occupied a large part of the time of the (first) International Roads Conference, held at Paris, France, in Oct., 1908. A summary report on this conference, including observations made in various foreign cities, has been published by Mr. Nelson P. Lewis, Chief Engineer by the Board of Estimate and Apportionment, New York City. Some form of bituminous macadam construction, Mr. Lewis concluded to be the consensus of opinion, should be employed for roads, thus giving cohesion and resistance to the road bed and preventing the formation of dust. Sprinkling with oil or tar is too expensive and temporary to give satisfaction. See INTERNATIONAL HIGHWAY CONGRESS.

PEABODY MUSEUM OF HARVARD UNIVERSITY. Peabody Museum of American Archaeology and Ethnology was founded in 1866, when George Peabody gave \$150,000 for that purpose and for a professorship in Harvard University, which has become the anthropological section of the University Museum. The South American Expedition is the most extensive expedition undertaken by the Museum. From its headquarters at Arequipa, Peru, expeditions are made with the object of gathering ethnological and other scientific collections. Explorations have been in progress under the direction of the Committee of Central American Research at the ruined cities of Central America. In 1908 an expedition explored the prehistoric cemetery near Madisonville, Ohio. The researches in relation to the antiquity of man in the Delaware River were continued during the year. A quarto memoir, vol. 4 (No. 2) with many plates covering explorations in Central America, has been published. The curator of the Museum and Peabody professor is Frederic W. Putnam. The secretary is Frances H. Mead.

PELLAGRA. This disease, caused by eating fermenting or decomposing corn, became a vital question in the South during 1908. North Carolina, South Carolina, Georgia, and Alabama were the States principally concerned. Prior to 1907 pellagra was not thought to exist in the United States. A fatal epidemic occurred in that year at the asylum for the colored insane at Mt. Vernon, Ala., and served to arouse the attention of physicians in this section of the country. The disease occurs both in an acute and chronic form, and is very fatal. The essential element in the production of pellagra is believed to be the result of the growth of certain fungi, constituting the "smut" of corn. This does not develop in maize allowed to ripen on the cob before being gathered, but in that which is plucked before maturity, and allowed to ferment or decompose. In European countries and in Egypt, the disease has long been prevalent. Rumania was said to have 50,000 cases of the disorder, and Italy 100,000, but the disease is not in these countries of such a virulent type as that reported in the United States.

PENANG. See STRAITS SETTLEMENTS.

PENNSYLVANIA. One of the Middle Atlantic States of the United States. Its area is 45,126 square miles. Its population in 1908, according to Federal estimate, was 7,137,315.

MINERAL RESOURCES. The value of the mineral products of Pennsylvania far surpasses that of any other State. According to the figures given by the United States Geological Sur-

vey the value of these products in 1907 was \$657,783,345, as compared with \$657,413,780 in 1906. This is more than three times the value of the product of any other State. Pennsylvania produces practically 50 per cent. of the coal mined in the United States. In both anthracite and bituminous production, Pennsylvania in 1907 exceeded any previous record in the history of the State. The total production was 235,747,439 short tons, with a spot value of \$319,248,082. Of this, anthracite composed 76,432,421 long tons and bituminous 150,143,177 short tons. In 1906 the output of anthracite was 63,645,010 tons, and of bituminous, 129,293,206 tons. The marked increase in both anthracite and bituminous coal in 1907 was due to the fact that the production of both was somewhat restricted in 1906 by the suspension of mining operations on April 1 of that year, pending the adjustment of the wage scale. The abnormally large increase in the production of anthracite in 1907 makes up for the depletion of stock caused by this suspension and represents a little more than half the normal increase in the production of 1905. The total number of men employed in the coal mines of Pennsylvania in 1907 was 330,529, of whom 167,234 were employed in the anthracite mines and 163,295 in the bituminous mines. There were in 1907, 708 men killed in the anthracite mines and 806 in the bituminous mines. The bituminous coal production has shown a rapid growth as compared with that of anthracite during recent years. Pennsylvania far outranks the other States in the manufacture of coke. In 1907 it produced more than 65 per cent. of the total coke output of the United States. There were produced 26,513,214 short tons, as compared with 23,060,511 short tons in 1906. About half this quantity is manufactured in the Connellsville region. The total value of the product in 1907 was \$67,638,024, as compared with a value of \$54,184,531 in 1906. In the production of pig iron Pennsylvania is also prominent. The production for 1907 remained practically the same as that of 1906, the respective figures being 11,348,549 and 11,247,869 tons. Pennsylvania is first among the States in the production of natural gas. In 1907 the product was valued at \$18,844,156, as compared with a value of \$18,558,245 for the product of 1906. The production of petroleum has shown a steady decrease since 1896. There were produced in 1907 9,999,306 barrels, as compared with 10,256,893 barrels in 1906. Pennsylvania now ranks sixth among the States in the production of petroleum, while in 1906 it ranked fifth. Pennsylvania is first among the States in the production of Portland cement. A marked increase was shown in 1907 over the product of 1906. In the former year, 20,393,565 barrels, valued at \$19,698,206, were produced, as compared with 18,645,015, valued at \$18,598,439 in 1906. Three counties of Pennsylvania produced over 60 per cent. of the entire slate production of the country. There was quarried in 1907 slate to the value of \$3,855,640, as compared with a value of \$3,522,149 for the output of 1906. The stone produced in the State in 1907 was valued at \$9,132,372, as compared with a value of \$8,804,776 in 1906. Stone is produced to a greater amount in Pennsylvania than in any other State. Other important mineral products of the State are, in order of their value in 1907: coal products, \$20,291,621; sand and gravel, lime, iron ores, clay, natural ce-

ment, glass-sand, mineral waters, metallic paint, feldspar, ochre, sand-lime brick and umber; and unclassified are aluminum, bromine, abrasive materials, quartz, salt, and talc.

The Chief of the Bureau of Anthracite Coal Statistics estimated that the shipments of anthracite for 1908 were 64,237,076 long tons, against 67,109,393 long tons in 1907. Assuming that the quantity of coal sold to local trade and used at the mines decreased in the same proportion, the total production in 1908 amounted to approximately 73,000,200 long tons, as against 76,432,421 long tons in 1907. See COAL.

AGRICULTURE AND STOCK RAISING. The acreage, production and value of the principal farm crops in 1908, according to the figures of the United States Department of Agriculture, were as follows: corn, 57,275,000 bushels, valued at \$41,811,000, from 1,450,000 acres; winter wheat, 28,415,000 bushels, valued at \$29,121,000 from 1,590,000 acres; oats, 27,382,000 bushels, valued at \$15,060,000 from 1,003,000 acres; barley, 234,000 bushels, valued at \$147,000 from 9000 acres; rye, 5,660,000 bushels, valued at \$4,358,000 from 343,000 acres; buckwheat, 4,992,000 bushels, valued at \$3,744,000 from 260,000 acres; potatoes, 19,944,000 bushels, valued at \$15,955,000, from 277,000 acres; hay, 4,677,000 tons, valued at \$56,124,000 from 3,118,000 acres; tobacco, 39,008,000 pounds, valued at \$4,095,840, from 29,440 acres. The State ranks second in the production of rye and fourth in the production of oats. In the production of buckwheat it ranks second, being surpassed only by New York. The corn crop of 1908 showed a decided increase over that of 1907, which was 45,922,000 bushels. The wheat crop showed a slight decrease, the figures for 1907 being 30,090,000 bushels. Oats, too, was a slightly decreased product, the figures for 1907 being 29,687,000 bushels. Hay showed a considerably increased production in 1908 over the crop of 1907, which was 4,568,000 tons. The tobacco crop was slightly smaller than that of 1907, which was 40,320,000 pounds. The number of farm animals on Jan. 1, 1909, was estimated to be as follows: horses, 619,000; mules, 43,000; dairy cows, 1,152,000; other cattle, 965,000; sheep, 1,135,000; swine, 990,000. The wool clip in 1908 was estimated at 5,700,000.

MANUFACTURES. The census of 1905, covering industries carried on in factories, reported \$1,995,837,000 capital, 763,282 wage-earners, and \$1,955,551,000 in value of products, these three items having increased, 1900 to 1905, respectively, 37.7, 15, and 18.5 per cent. The State easily ranks second in every item, being exceeded by New York alone. Of the wage-earners, 134,344 were women and 34,451 were children under 16. The value of products of leading industries in 1905, and, in parentheses, the per cent. of increase in value over 1900, were as follows: Steel works and rolling mills, \$363,773,000 (9.3); foundry and machine shop products, \$119,651,000 (8.5); blast furnaces, \$107,455,000 (5.8); leather, \$69,428,000 (24.8); railway repair shops, \$61,021,000 (41.7); petroleum refining, \$47,459,000 (35.7); silk and silk goods, \$39,333,000 (26.6); cigars and cigarettes, \$39,079,000 (24.1); flour and grist mill products, \$38,518,700; (30.3); sugar and molasses refining, \$37,182,000 (2.8); worsted goods, \$35,683,000 (61.4); malt liquors, \$34,863,800 (16.3); lumber and timber products, \$31,642,000 (9.7 per cent. decrease); hosiery and knit goods, \$30,753,000

(40.5); newspaper and periodical publishing, \$30,294,000 (36.5); coke, \$28,924,000 (22.9); glass, \$27,671,000 (25.7); carpets and rugs, \$27,120,000 (17.3); electrical machinery and apparatus, \$26,257,000 (37.4); wholesale slaughtering and meat packing, \$24,411,000 (36.9); cotton goods, \$24,137,000 (3.1); structural ironwork, \$23,705,000 (60); men's clothing, \$22,662,000 (slight decrease); planing mill products, \$21,928,700 (31). Other industries, with a value of products exceeding \$10,000,000 in 1905, were in the order of their rank: Steam railroad cars, tin andterne plate, woolen goods, book and job printing, chemicals, paper and wood pulp, women's clothing, boots and shoes, lime and cement, furniture, cheese, butter and condensed milk, illuminating gas, pottery and terra cotta, oil and confectionery. The combined iron and steel group of industries showed products valued at \$692,200,000, or 35.4 per cent. of the State's total value of products. The value of output of iron and steel works and rolling mills was 54 per cent. of the country's total. Pennsylvania also ranks first in leather, petroleum refining, carpets and rugs, coke, glass, and oil; and second in cotton small wares, hosiery and knit goods, silk and silk goods, worsted goods, cigars and cigarettes, planing mill products, clothing, electrical machinery and apparatus, and chemicals. the value of products credited to leading centres was as follows: Philadelphia, \$591,388,000; Pittsburg, \$165,428,800; Reading, \$30,848,000; New Castle, \$29,433,000; Johnstown, \$28,891,800; McKeesport, \$23,054,000; Scranton, \$20,453,000; Erie, \$19,911,000, and Harrisburg, \$17,146,000.

EDUCATION. The whole number of pupils of school age in the State, June 1, 1908, was 1,231,200; the average number of pupils in daily attendance, 951,670; the number of male teachers was 7488, and female, 26,525, making a total of 34,013 teachers in the State. The sum paid out for teachers' wages during 1908 was \$17,600,342.93. The total expenditure for schools for the year was \$34,070,916.94. There were in the State 2580 school districts and 33,171 schools. The estimated value of the school property of the State, June 1, 1908, was \$90,316,211.51. The average salary of male teachers per month was \$61.23, and the average salary of female teachers was \$46.85; the average length of the school term in months was 8.44. During the year the number of pupils increased 5872, the number of schools, 579; the number of districts, 6, and the amount paid in teachers' wages, \$1,803,388.90. The number of pupils in attendance in the schools of Philadelphia at the end of the year 1908 was 172,140; the average attendance was 147,876. There were 4310 schools in the city with 363 male and 3947 female teachers. The average salary of the male teachers per month was \$164.90, and of female teachers, \$77.90. The total expenditure for schools in the city during the school year was \$6,524,598.07 and the estimated value of school property was \$17,279,296.

FINANCE. The report of the treasurer for the fiscal year ending Nov. 30, 1908, shows that there was a balance in the general fund on Dec. 1, 1907 of \$10,486,410. The receipts from all sources for the year ending Nov. 30, 1908 were \$25,670,540, and the payments for the general fund for the same period were \$29,158,878, leaving a balance in the general fund on Dec. 1, 1908 of \$6,998,073, which, with the balance in the sinking fund, made the total amount in the

treasury at that date \$9,540,604. The chief sources of revenue for the year were, tax on capital stock, \$3,684,164; tax on corporate gross receipts, \$1,496,863; tax on premiums, \$1,339,346; tax on corporate loans, \$1,824,200; tax on personal property, \$4,209,361. The chief expenditures were, for hospitals and asylums for the insane, \$2,213,737; for charitable institutions, \$2,778,289; common schools, \$6,883,128; for the construction of highways, \$3,194,992. The State debt on Nov. 30, 1908 was \$2,689,617 and the sinking fund assets were \$2,642,531, leaving a net State debt on that date of \$47,085. The estimated income from the general fund for the fiscal year ending Nov. 30, 1909, is \$26,700,000.

POLITICS AND GOVERNMENT. There was no session of the State Legislature in 1908 and no general election for State officers. Several important court proceedings affecting the State were instituted during the year. On June 5, proceedings were begun to test the constitutionality of the Commodity clause of the Hepburn Act, which provides that all railroads must sever their connection with all other business except that of common carrier. Bills in equity were filed against six railroads, the Philadelphia and Reading, the Delaware, Lackawanna and Western, the Delaware and Hudson, the Pennsylvania, the Erie and the Lehigh Valley, all of which are engaged in transporting anthracite coal in interstate commerce. The Hepburn Act became operative on May 1, and Attorney-General Bonaparte, who brought the suits, asserted that these roads had owned and operated mines contrary to the law since that date, and that the products of the mines were carried into other States by the defendant companies. On Aug. 5, Judge Blair of the State Supreme Court decided that the pure food law, passed in 1907, is unconstitutional in that it violates Sec. 6, Article III. of the State Constitution, which forbids amendments to law by title only. The effect of the decision was to cause prosecution under laws previously enacted.

Trial of the persons accused of defrauding the State of large sums of money in the furnishing of the new State Capitol at Harrisburg began on Jan. 27, at Harrisburg. The defendants were John H. Sanderson, who had the contract for "trimming," Dr. William P. Snyder, former auditor general of the State, W. L. Mathues, former State Treasurer, and James Shumaker, former Superintendent of Public Grounds and Buildings. The case tried involved tables, chairs, sofas and clothes-trees furnished by Sanderson, on which fraud of \$19,000 was alleged in a bill of \$50,000. Ten other defendants were under indictment in 38 cases. After a trial lasting until March 13, the defendants were all found guilty. The former State officials were convicted for conspiracy. A second trial began at Harrisburg on May 11. In this the defendants were Joseph M. Huston, the architect of the building, the defendants mentioned above, and H. Burd Cassell, contractor for metallic furniture. The case involved the metal furniture in a single room, in which it was alleged that there was a fraudulent overcharge of \$5090.10 in a total bill of \$17,789.70. On June 12, Judge Kunkel directed the acquittal of Snyder, Mathues and Shumaker, and on June 13 the jury acquitted the other defendants. On Dec. 18, Sanderson, Snyder, Mathues and Shumaker were sentenced on their conviction on the first trial to

two years separate and solitary confinement, \$500 fine each, and the payment of the cost of prosecution. The execution of the sentence was stayed, pending the outcome of an appeal to the Supreme Court from Judge Kunkel's refusal to grant a new trial. Mathues died several weeks after the sentence had been pronounced. The acceptance of the portfolio of State by Senator Philander C. Knox will leave a vacancy after Mar. 4 in the Senate from Pennsylvania. A successor to Senator Penrose is also to be chosen in 1909.

PHILADELPHIA. An election for city solicitor, city magistrates and other city officers was held on Feb. 18. The chief struggle was between the "reform" element, and the regular organization. The result was a decisive victory for the organization. The Republicans were successful in every district in the city, save one, where a "reform" councilman was elected. Among the defeated candidates for the council was Owen Wister, the writer. The new city subway was opened for traffic on Aug. 4. In October the city celebrated with festivals and pageants the 225th anniversary of its founding. A new opera house for grand opera was opened during the year. The Bureau of Municipal Research, with the consent of the Mayor, signified its intention in November, to make an investigation into the city departments. The departmental budget for 1909 aggregated about \$27,000,000. The city council on Mar. 22 passed ordinances providing expenditures for port improvements for the city of \$1,500,000. In the election of Nov. 3, there were cast in the city 184,469 votes for Taft, and 73,779 for Bryan.

CONVENTIONS AND ELECTIONS. The Republican State Convention for the selection of delegates to the National Convention met at Harrisburg on April 29. Resolutions were adopted instructing the delegates chosen to vote for Senator Philander C. Knox for President, as long as he should be a candidate. The Democratic State Convention on May 20 refused to instruct delegates to vote for W. J. Bryan largely through the efforts of Col. J. M. Guffey, State Chairman. For the action of the National Convention in unseating the delegates opposed to Mr. Bryan, see **PRESIDENTIAL CAMPAIGN**. In the election of Nov. 3, the State was carried for Taft by a Republican plurality of about 296,000. The detailed vote for the national ticket was as follows: Taft, 745,779; Bryan, 448,785; Chafin, 36,694; Debs, 33,913; Hisgen, 1057; Gilhaus, 1222.

OTHER STATE EVENTS. During the greater part of the year the city of Chester suffered from a street railway strike. There was much mob violence and many persons were injured. For an exhaustive account of these troubles, see **STRIKES**. On Jan. 13, in the burning of the Rhoades Opera House at Boyertown, over 100 persons were killed, either by being burned, or by suffocation. The fire was caused by the explosion of a moving picture machine, which was being used at an entertainment. The Allegheny National Bank of Pittsburgh was obliged to close its doors on May 18, owing to defalcation by the cashier, W. M. Montgomery, amounting to over \$2,000,000. There was \$550,000 of State funds on deposit in the bank. At his trial for theft Montgomery pleaded guilty. The Wabash Railroad, after spending \$30,000,000 for terminal facilities and other improvements, decided in June to abandon its attempt to operate its lines to

Pittsburg. In the week beginning Sept. 28, Pittsburg celebrated the 150th anniversary since the capture of Fort Duquesne from the French and the establishment of Fort Pitt in its stead. There was an elaborate programme, with civic parades and pageants.

The year was notable for an unusual number of fatal coal mine disasters. On May 12, seven miners were killed and several others injured in an explosion in the Mount Lookout Colliery of the Temple Coal and Iron Co., at Wilkes-Barre. Six miners were burned on June 19, in an explosion, followed by fire in the Ellsworth mine of the Pittsburg Coal Co., at Monongahela City. An explosion in the Williamstown colliery of the Susquehanna Coal Co., at Pottsville, on July 15, resulted in the death of seven miners. The most serious disaster of the year occurred at the mine of the Pittsburg and Buffalo Coal Co., at Marianna, on Nov. 28. An explosion from some unknown cause resulted in the death of every person in two pits of the mine. The number killed was about 200. The mine was considered one of the model coal mines of the world, and it had been inspected just before the explosion occurred. Floods caused great damage at Pittsburg and other places in the State in the early part of the year.

Evidences of a systematic and long continued corruption in the State Council of Pittsburg resulted, on Dec. 23, in the arrest of seven Councilmen and two bankers. Among other charges against the councilmen was that they had influenced the deposit of State money in banks for considerations paid to them.

STATE OFFICERS. Governor, E. S. Stuart; Lieutenant-Governor, R. S. Murphy; Secretary of the Commonwealth, Robert R. McAfee; Treasurer, J. O. Sheatz; Auditor-General, R. K. Young; Adjutant-General, Thos. J. Stewart; Attorney-General, M. Hampton Todd; Superintendent of Public Instruction, N. C. Schaeffer; Insurance Commissioner, David Martin; Secretary of Agriculture, N. B. Critchfield—all Republicans, except Schaeffer, Dem.

JUDICIARY. Supreme Court: Chief Justice, James T. Mitchell; Associate Justices, J. Hay Brown, Wm. P. Potter, John Stewart, D. Newlin Fell, S. L. Mestrezat, and John P. Elkin.

The State Legislature of 1909 is composed of 39 Republicans and 11 Democrats in the Senate, 173 Republicans and 34 Democrats in the House. The State representation in Congress will be found in the article UNITED STATES under the section *Congress*.

PENNSYLVANIA, UNIVERSITY OF. An institution of higher learning, founded in 1740 at Philadelphia. The attendance shows a continued increase, being 4,570 in all departments at the beginning of the academic year 1908-9. Of this number 2,989 students belonged to the college, 353 to the graduate school, 327 to the law school, 599 to medicine, 385 to dentistry, and 150 to the department of veterinary medicine, or a total of 4,763, which, deducting 193 for students duplicating certain courses, makes a net total of 4,570. These students not only represent various States in the Union, but also many countries in various parts of the world, including a number of South American students, 21 from Australia, 31 from China, and 9 from Japan. The members of the various faculties have also increased and now number 454, including professors, assistant professors, and

other officers of instruction. Ten years ago the total student list for the whole university was 2,790, and the officers of instruction numbered 258. The different departments of the University show progress in many ways in addition to membership increase, such as a continued strengthening of curriculum, and the steady growth of building operations for university needs. Important additions have recently been made to the hospital and dormitories, and the new buildings of the veterinary department. The University library contains over 285,000 catalogue volumes and many unbound pamphlets. The amount of the productive funds in 1908 was \$5,337,796, and the total income, including tuition and incidental charges, \$540,624. The Provost is Charles C. Harrison, LL.D.

PENOLOGY. The interest manifested in recent years in prison reform and the treatment of criminals showed itself in 1908 in legislation, in the discussions at the meeting of the American Prison Association and in the appointment by President Roosevelt of a committee of investigation. The American Prison Association held its annual meeting at Richmond, Va., Nov. 13-19. There was in attendance six hundred and thirty registered members and visitors from thirty-seven States, Canada and Cuba. The discussions revealed the topics of greatest immediate interest in the subject of penology. The subject of uniform criminal laws for all States was animatedly discussed. The Prison Physicians' Association discussed the subjects of tuberculosis in prisons and the sterilization of habitual criminals. The association provided for a committee to inquire into the advisability of extending the parole system to life prisoners. The next session of the association meets at Seattle. The International Prison Congress meets at Washington in 1910.

Several States took noteworthy action. Georgia (q. v.) was deeply stirred by an inquiry into the convict lease system and passed a law putting an end to that system in April, 1909. Massachusetts enacted three new probation laws as the result of the efforts of the Massachusetts Prison Association. These provide for the extension of mutual aid and knowledge of conditions among the various probation officers of the State. A committee on probations to be appointed by the Chief Justice of the Superior Court was authorized. Ohio provided for a most advanced system of probation and parole. In all cases except the most reprehensible crimes the defendant may be sentenced to the penitentiary or the reformatory but with the execution of the sentence suspended. He then passes under the control of the board of managers of the institution and is subject to the rules governing persons paroled from that institution. Field officers are to be appointed to oversee both those paroled and those on probation and are to have power to arrest such without a warrant. The board of managers may terminate a sentence when they see fit and they may also discharge probationers from further supervision. Persons sentenced to jails or workhouses may be put under the care of court probation officers, though not for more than two years. Provision is made for salaried probation officers in cities which have police courts; policemen are made eligible to these offices.

A report of the Maryland Commission on Indeterminate Sentences, submitted in March,

recommended that the probation system in use in Baltimore should be extended to the entire State. This provides for a considerable number of probation officers supervised by a central board; this board maintains an interest in the prisoners after their discharge and assists them in finding employment. The commission recommended the adoption of cumulative sentences and a revision of the State's penal code.

New York has been one of the foremost States in prison reforms. The report of the State parole board, March, 1908, stated that since 1901, 1,378 prisoners had been paroled and of these only 16 per cent. had broken parole. This was considered very favorable, since the system during these years was undergoing modification and experimentation. In New York City, Miss Maude E. Miner, while performing the duties of a probation officer for the Night Court, saw plainly the necessity of a home where women could be taken temporarily from the various city courts. Consequently, on Feb. 1, she opened a home where such women can find friendly protection for a few days while probation officers are investigating their stories and finding their friends. In June the New York Probation Association was formed to take control of this home and to coördinate and develop the probation work of the city. The Board of City Magistrates approved the home, and, in his annual report, the president of the board strongly emphasized the usefulness of such a means of bringing into play the saving influence of personal sympathy. During the year the administration of the New York City Reformatory for Misdemeanants on Hart's Island was severely criticized. It was alleged that the buildings were antiquated and the discipline poor; large and small boys were housed together with no attempt at classification. The result of these conditions is that the reformatory fails to reform. The State Legislature provided for a commission to investigate conditions and methods of procedure in the inferior criminal courts of New York, Rochester and Buffalo.

CANADA. The harvesting season in Manitoba was marked by such a scarcity of laborers that the government advised the releasing of prisoners held for petty crimes on condition that they engage in farm labor. In many localities advantage was taken of this, the prisoners receiving from two to three dollars per day.

UNITED KINGDOM. A new probation law was enacted by Parliament which permits a person found guilty of a minor offense to remain unconvicted on the records provided he signs the pledge and avoids further delinquency. In the *Contemporary Review* for October, English prisons for females are characterized as small, unsanitary and humiliating in discipline, while the occupations learned are said to be of neither economic nor educational value. The writer emphasized the necessity of trained nurses as matrons, of the use of indeterminate sentences and probation and devices, such as more comfortable quarters and neater clothing, for arousing enthusiasm and social spirit. The official report of the prison population of England shows that the total prison population in England and Wales in 1908 was 196,233. The average daily prison population was 17,719, of whom 2,664 were females. Only 5 per cent of whom 2,664 were females. Only 5 per cent. of 78.3 per cent. could read and write imperfect-

ly. The number of convictions per 100,000 of the population was 505.4 in 1908, as compared with 568.9 in 1904 and 483.4 in 1900.

PERKINS MEDAL. See CHEMISTRY, INDUSTRIAL.

PERNTNER, JOSEF MARIA. An Austrian meteorologist, died in Dec., 1908. He was born in Neumarkt, Tyrol, Austria, on March 15, 1848, was educated at Innsbruck and Vienna, in 1880 became assistant, and in 1884 substitute on the staff of the Vienna Meteorological Station. In 1885 he was *privatdozent* in the University of Vienna, in 1890 assistant professor at Innsbruck, and in 1893 full professor of physics there. In 1897 he was made professor of physics at the University of Vienna, and director of the Meteorological Station, succeeding Hann. He made a special study of meteorological optics. He pointed out the relation between the colors in rainbows and the size of raindrops, and after a careful investigation pronounced useless the employment of explosives to avert hail-showers. He published *Meteorologische Optik* (1902).

PERRIER, EDMOND. See ANTHROPOLOGY.

PERRY, DAVID. An American soldier, died in Washington, May 18, 1908. He was born in Connecticut on June 11, 1841, was appointed a second lieutenant of cavalry in 1862, and served in that branch of the service until his retirement as colonel in 1898. He served throughout the Civil War in the Cavalry Corps of the Army of the Potomac, and during the remainder of his career was almost continuously on duty on the frontier, serving in nearly all the important Indian wars of the period. His best known service was his capture of Captain Jack, the Modoc chief, in 1873 after the latter's murder of General Canby. He was once rewarded for Civil War service and twice for gallantry in Indian engagements. In 1904 he was made brigadier-general and retired.

PERSIA. An independent State of western Asia. Area, 635,000 square miles, a large part being desert; population, 9,000,000, one-fourth nomads. The estimated population of the principal cities is: Teheran, the capital, 280,000; Tabriz, 200,000; Isfahan, 70,000; Meshed, 60,000; Kerman, 60,000; Yazd, 45,000.

PRODUCTION, COMMERCE, ETC. The naphtha works at Cheleken were reported in 1908 to be turning out daily 12,000 poods (1 pood=36 lbs.), selling on the average at 13 cents per pood. The Tashkend Railway is reported to have purchased of these works several million poods of naphtha in 1908. Russian traders were erecting a cotton spinning mill at Termez—the first in the country. The imports and exports in 1906-7 amounted to 431,040,000 and 353,377,000 krans respectively (1 kran=about 8 cents), against 386,463,000 and 293,143,000 in 1905-6. The principal imports are cotton fabrics, sugar, tea, woollens, petroleum, iron and steel goods, and the precious metals. The principal exports in 1906-7 were as follows: Fruits, 55,030,000 krans; carpets, 48,442,000; cotton, 46,689,000; fish, 32,174,000; rice, 25,518,000; raw silk and cocoons, 17,068,000; rubber, 15,889,000; wool, 14,928,000; opium, 14,812,000; hides and skins, 13,668,000; silk goods, 5,819,000; living animals, 5,616,000; cotton goods, 4,878,000; copper, 3,285,000; cereals, 3,181,000.

The trade with the principal countries of origin and destination in 1906-7 was as follows, in krans:

From and to	Imports	Exports
British Empire	132,302,000	36,629,000
Russia	222,404,000	225,380,000
Turkey	13,027,000	59,034,000
Afghanistan	6,330,000	4,617,000
France	23,864,000	13,963,000
Germany	8,335,000	1,514,000
Austria-Hungary	14,931,000	29,000
United States	559,000	3,130,000

There is but one six-mile railway from Teheran to Shah Abdul-azim. Several carriage roads have been constructed, mostly by Russian companies. The principal cities are connected by a regular postal service. There is a semi-weekly postal service to Europe via Russia, and a weekly one to India from Bushire, on the Persian Gulf. There are about 3,920 miles of telegraph.

The Imperial Bank of Persia, an English corporation, with a capital of £650,000, has the exclusive right to issue notes. It has branch offices and agencies in the principal cities of Persia and in Bombay, India. The Russian "Banque d'Escompte," at Teheran, is connected with the Russian State Bank. In 1907 a concession was granted for a national bank with exclusively Persian capital, which is to amount to about \$25,000,000. In the same year a concession was granted for a German bank, with a capital of \$1,000,000, for a term of 30 years.

GOVERNMENT. In Jan., 1906, the Shah, hitherto an absolute monarch, consented to the convocation of a National Council, which met at Teheran on Oct. 7. The constitution of Dec. 30, 1906, signed by the late Shah and confirmed by his successor on Feb. 11, provides for the creation of a Parliament, consisting of a National Council and a Senate. The members of the former are to be 156 in number, but may be raised to 200. They are to be elected for two years by six classes of voters, namely, princes of the reigning family, priests and religious students, nobles, merchants, owners of land worth at least \$1,000, and tradesmen. The National Council is to have full control over the government, including the appointment of responsible ministers, internal administration, finance, concessions, and treaties, excepting such as in the interests of the State may require secrecy. The Senate is to consist of 60 members, of whom 30 are to be appointed by the Shah and 30 elected by the National Council; of each class of members, 15 are to be from Teheran and 15 from the provinces. In case of disagreement, the two houses are to meet together. In case of further disagreement, the Shah may, with the consent of the Senate and the ministers, dissolve the National Council and call for new elections. A new constitution, signed by the Shah on Oct. 8, 1907, limited the Shah's prerogatives and his ecclesiastical authority, granted liberty of conscience, of the person, of speech, press, association, and education, and defined the duties of Parliament and the responsibility of ministers.

The National Council which was elected and met in 1907 consisted of only 111 members, and there were 52 members from Teheran, whereas the constitution assigned to it only 30 members. No Senate has yet been elected. On Nov. 23, 1907, the Shah published an edict abolishing the constitution, but on the follow-

ing day he was compelled by the British and Russian representatives at Teheran to retract his edict and reestablish the organic law.

FINANCE. No official statistics of revenue and expenditure are published. About half the revenue is derived from taxes in money or in kind paid by villages, towns, and districts, each of which is responsible for a fixed sum. The other half is derived from customs, posts, telegraphs, fisheries, mines, and other concessions. For 1906-7 the revenue was estimated at 80,000,000 krans. The English £500,000 loan of 1892 has been extinguished, the foreign loans now outstanding being the Russian loan of 1900, 22,500,000 rubles, and the Russian loan of 1902, 10,000,000 rubles. One condition of the 1900 loan was that Persia shall contract no foreign loans without the consent of the Banque d'Escompte until the extinguishment of the loan. A Russian financial agent for Persia is permanently stationed at Teheran.

ARMY. The official list places the strength of the regular army in 1908 at 91,334, consisting of 63,865 infantry, 5,309 artillery, 1,800 Cossacks, 14,957 irregular cavalry, and 5,403 frontier and trade route guards. But the number actually with the colors is estimated at only about 30,000, and the war effective at 60,000. There is no navy.

HISTORY.

REACTION. The Shah had taken his oath to observe the constitution before the Mejliss (Parliament) on Nov. 12, 1907, and renewed it on Dec. 22, after the resignation of the ministry and the appeal of the Nationalists to the Powers against his resumption of arbitrary rule, but the beginning of 1908 saw the reaction in full swing. The Shah did not keep his promises and the disorder and discontent continued. An attempt was made on his life on Feb. 28, 1908, when a bomb was thrown at him while on his way to the palace, killing several men and horses but leaving him uninjured. The cabinet resigned early in May, and in the following month rumors of a *coup d'état* began to spread. Armed forces of the Nationalists gathered for the protection of Parliament and revolutionary placards were posted in the city. Parliament demanded the dispersal of the reactionary palace clique and at first the Shah seemed disposed to accede. On June 4 he withdrew from the palace and with a strong guard formed a camp in the Royal Garden outside the western gate. On June 15 he sent an ultimatum to Parliament demanding the dispersal of the armed Nationalists around the Mejliss buildings and Parliament promptly obeyed. Parliament, however, submitted a memorandum asking him to observe the constitution and the principle of ministerial responsibility and to cooperate for the restoration of public confidence. To this he promised a written answer, but he declared at once that he would not surrender the throne without an appeal to the sword and he demanded the arrest and punishment of the Nationalist leaders.

THE COUP D'ETAT. The army was disloyal, but in Teheran the Shah had at his disposal a force of Cossacks, of whom, in violation of his promise to the Mejliss that they should be placed under the ministry of war, he still retained control. Under their Russian commander, General Liakhoff, the Cossacks on June 25 surrounded the Parliament buildings, taking the Nationalists by surprise. Guns were fired at

close range and the defenders were rapidly dispersed. The public buildings and some of the neighboring houses were looted and severely damaged. Many of the Nationalists were killed, including several of the deputies. Twenty-five of the Nationalist leaders were taken prisoners and on the following day two of them were hanged. In the course of the fighting many innocent persons lost their lives. Parliament was dissolved for three months, a new election being promised. Martial law was proclaimed and the city was virtually at the mercy of the Cossacks. Leading members of the Mejliss took refuge at the embassies and the British and Russian representatives urged the Shah to take measures for the restoration of peace and order. The Shah complained of the protection afforded by the embassies to the refugees, but the British government in reply referred to the number of executions in the city without trial. Pickets having been stationed near the British embassy, the British representative demanded an apology for this and other insolent acts of the Cossacks, and on July 11 the Shah's formal apology was tendered.

INTERNAL DISORDERS. Throughout the year the Shah continued to rule in violation of the constitution. Meanwhile the province of Azerbaijan was in revolt and some serious fighting had taken place in the capital, Tabriz, between reactionaries and revolutionists. European fugitives sought the protection of the Russian Consuls-General. By the middle of July the Shah's troops held only a comparatively small portion of the city, the rest being in the hands of the revolutionists who alleged that they were fighting to preserve the constitution which had been granted by the present Shah and his predecessor. The Shah's general, Rakhim Khan, could make no headway against the revolutionists and was withdrawn after some sharp fighting in the street. His emissary, Ained-Dowleh, on demanding surrender, was met by a counter-request for amnesty, admission of their party to the government, the banishment of the reactionaries and the calling of a national assembly. On Sept. 8 the British and Russian governments presented an identical note, calling the Shah's attention to the disturbances in the provinces, especially at Tabriz, and the danger to the lives of foreigners, and urging him to order the promised elections as soon as possible to reassure the people as to the maintenance of the constitution. They advised the convocation of the new Mejliss on Nov. 15. On Sept. 11 the Shah's troops were defeated at Tabriz, where Sata Khan, the Nationalist leader, was now in control, and the Shah offered to grant a constitution but only on condition that the Nationalists of Tabriz lay down their arms and surrender four of their leaders, including Sata Khan. The Tabriz revolutionists, on the other hand, demanded first, the reestablishment of the Mejliss, saying that if this were done they would disarm and permit their chiefs to be tried by judges chosen by the Mejliss. Affairs were at a deadlock so far as Tabriz was concerned, and in October it was announced that the Shah had abandoned all operations against the city for the winter. Anarchy in the northern provinces continued and Russian residents at Tabriz sent their families home, thinking there was no prospect of the return of order.

THE SHAH'S SHIFTING POLICY. On Sept. 23, the Shah ordered a new Mejliss to meet on Nov. 14, especially enjoining that it should be "upright and pious." New rules for the election were required to be ready on Oct. 17. Tabriz was expressly excluded from the operation of the decree. Nothing was done, however, to carry the measures into effect, in spite of a petition of the Nationalists and an urgent request of the British and Russian ministers that the Shah should keep his pledge (Nov. 12). On Nov. 19 he called a meeting of merchants at which one of his supporters referred to the "King-worshipping" spirit of Persia and said the "impious" Mejliss had aimed at undermining that spirit and curtailing the Shah's prerogatives. The Shah declared he was responsible to God and deeply pained by the blood shed in his dominions. He afterwards issued a rescript addressed to the reactionary Moslem priests, saying: "Now that you have declared that the establishment of a Mejliss is contrary to the laws of Islam and therefore have pronounced it to be unlawful, and now that also the Mollahs in the provinces have by letters and telegrams pronounced it to be unlawful, we have, this being the case, changed our mind, and shall never again mention the name of such an institution." Vigorous protests followed immediately from the British and Russian governments, but although the decree abolishing the constitution was withdrawn, the year closed without prospect of a return to the Parliamentary régime. Meanwhile, the disorders attendant upon a weak and discredited central government continued. Disaffections had spread to the southwest provinces. The vice-governor of Kerman was killed and the city seized, and at Sultanieh the governor was expelled. It was reported that the priests had proclaimed a Holy War against the Shah. In Tabriz it was questionable in December whether the Shah or Sata Khan would prevail. It was understood that Russia would recognize either, if order were restored in the province of Azerbaijan. The treasury was depleted and the Shah's servants were ill-paid or not paid at all. The highways were unsafe, the tribesmen having received, it is said, the privilege of looting in return for aiding the cause of the reactionaries. Among other outrages may be mentioned the robbing and killing of the Governor-General of the Persian Gulf ports. At Meshed the Nationalists routed the garrison and seized some of the government officials. The constitutional movement was by no means crushed. The course of Great Britain and Russia in supporting the constitution had materially aided them, and on Dec. 7 the Nationalists of Teheran addressed a circular to the diplomatic body thanking them for their sympathy with the cause of freedom and blaming the court for its refusal to grant the constitution.

DIFFICULTIES ON THE FRONTIER. The trouble over the Turco-Persian frontier continued in 1908. The town of Suj-Bulak was attacked on Jan. 11 by a large force of Kurds, including, it is said, a number of Turkish regulars, and both Kurds and Persians lost heavily. The joint Turco-Persian delimitation commission was in session at Urumiah in February. The Persians charged the Turkish general, Fazyi Pasha, with aggression, and the Turks replied that he had merely employed force in putting down the Kurds and that he had occupied Suj-Bulak at

eth request of the Sunnite inhabitants, but he was ordered to return to Turkish territory. Difficulties arose also with the Russians, of whom several were killed on the border of Azer-bijan. On April 13 the Kurdish raiders attacked the Russian garrison at Belesuvar. Russian troops crossed the frontier and defeated the Kurds in the mountains of Kara Dag. Some Persians were killed and Russia indemnified the families at the demand of Persia, but in return asked for reparation for the Kurdish depredations and for the murder of the Russian minister Gribayedeff at Teheran and the wounding of the Russian financial agent. In the summer the depredations of the Turkish Kurds on the frontier continuing, the British, Russian and Persian ministers complained to the Porte, but the latter denied that the Turkish troops had passed beyond the frontier zone, though it ordered at the same time the recall of any detachment that might have done so. The change in the Turkish government did not avert the danger of further depredations from Turks and Kurds who were gathered in the neighborhood of Urumiah, though the new Turkish ministry made fair promises to Persia, assuring her of a just settlement of the boundary dispute and the withdrawal of Turkish troops from her territory.

PERU. A republic of South America. Its area is probably about 440,000 square miles, though some estimates bring it up to nearly 700,000 square miles. Estimates of the population vary from under 3,000,000 to over 4,600,000. Over one-half are pure Indians, one-fourth are mixed, one-sixth are white, and negroes and Chinese make up each about two per cent. of the total population. The principal cities, with their enumerated or estimated populations, are: Lima, the capital, 140,884, including 5,522 Chinese and Japanese (June 26, 1908); Arequipa, 35,000; Callao, 31,000; Cuzco, 10,000; Iquitos, 10,000; Cerro de Pasco, 10,000. The government encourages immigration by paying the transportation of laborers whose introduction is desired by their employers.

EDUCATION. Instruction is free in the public schools maintained by the municipalities. In 1903 there were 1,871 primary schools, with 104,970 pupils, about one-fourth the total population of school age. High schools are maintained by the Federal government in the capitals of departments. Private high schools in Lima and other towns are under the direction of European teachers. American women have been engaged as teachers in the normal schools. Lima contains the University of San Marcos, a school of mines and civil engineering, a national agricultural school, a school of arts and crafts, etc. Arequipa, Cuzco, and Trujillo have small universities. The federal government contributes about \$100,000 a year toward primary education and sends students to American universities. In 1908 a bill was under consideration for establishing schools of agriculture and allied subjects in each department.

MINING. The mineral resources are enormous. Cerro de Pasco is the centre of the mining industry, the work being done by "cholos," natives of mixed Spanish and Indian origin, as well as Austrian Slavs, Poles, Bohemians, Greeks, Spaniards, and Italians. Americans are the superintendents and managers of the mines, foremen, mechanics, railway and clerical employees. The Cerro de Pasco Company, organ-

ized by New York financiers, had invested, by the beginning of 1908, \$17,500,000 in its enterprises, which include a railroad of 83 miles from Oroya to Cerro de Pasco and a great smelter with an annual capacity of 30,000 tons of copper. Its shipments of copper to the United States in 1907 amounted to 20,152,000 pounds, most of it via Panama. The total mineral production of Peru in 1907 was valued at £3,479,057, against £2,610,574 in 1906. (The Peruvian pound, like the British, equals \$4.866½.) The principal minerals are copper and silver. In 1907 the production of copper was valued at £1,709,337, against £906,055 in 1906; of silver, £1,229,951, against £972,958 in 1906. Other mineral products are coal, anthracite and bituminous, petroleum, gold, quicksilver, lead, bismuth, nickel, salt, borates, sulphur, and antimony. The production of all minerals, excepting coal, increased in 1907 over 1906. Coal is scarce and dear. Enormous deposits lie practically in sight, but are unworked, with the exception of one worked by an American company. In 1906 there were 67 reduction plants employing 13,961 workmen.

A concession for exploiting the pearl fisheries of Sechura Bay was granted on Oct. 31, 1908.

AGRICULTURE. The chief agricultural region consists of a series of fertile valleys parallel to the coast line—from 1,300 to 1,400 miles in length—and extending to the chain of the Andes, the width varying from 25 to 75 miles. Other rich farming districts lie in the plains and valleys of the mountains, but they are less thickly populated and less productive. The cereals—wheat, barley, and corn—are produced in these districts and on the coast. The coast region is more important as the source of production of the three staple tropical crops of Peru—sugar cane, cotton, and rice. The rice production in 1906 was estimated at 60,000,000 bushels. The sugar output in 1908-9 was estimated at 160,000 metric tons, against 145,000 tons in 1907-8 and 169,000 in 1906-7. The rum distilled in 1907-8 amounted to 30,563 gallons. The best Peruvian cotton is grown near Piura and is shipped from Paita. The total export from Peru in 1906 was 23,253,090 kilos (1 kilo=2 1-5 lbs.). The crop of 1907 was larger, being estimated at 55,000 bales of 500 pounds each, and the prospects for the 1908 crop were reported good. The larger plantations have modern ginning machines and hydraulic baling presses. Cotton seed and oil cake are exported to Europe, while the oil is used locally in the manufacture of soap. There is a constantly increasing demand for Peruvian cotton in the United States, it being quite distinct from the American variety. The export of rubber through Iquitos, the emporium of the Peruvian rubber trade, amounted to 2,358,839 kilos in 1907, against 2,152,421 kilos in 1906. The rubber is gathered mainly from trees growing wild in the Amazon basin. Coca, from which cocaine is made, is a staple product. Other agricultural products are coffee, tobacco, ramie, silk, olives, wine, cinchona, medicinal and dye plants. Wool from sheep, alpaca, and llama, and vicuña skins exported. The annual wheat consumption averages 50,000 tons, the bulk coming from Chile, and a large part of the remainder from Australia.

MANUFACTURES. The manufacturing industries, except in the treatment of mining products, are as yet in their infancy. The native

industries comprise hat-plaiting and the weaving of coarse woolen blankets and cloth. There are some cotton factories, which turn out about 20,000,000 yards a year of the coarser sorts of cloth. Recently an American company established a factory equipped with the most modern appliances for the manufacture of white goods. Other manufactures are beer, cigars, clothing, soap, matches, candles, olive oil, cotton-seed oil cake, saddlery, furniture, etc.

COMMERCE AND COMMUNICATIONS. The imports and exports in 1906 amounted to £5,632,349 and £6,600,325, respectively; in 1907, £5,514,787 and £5,747,732 respectively. The value of the principal exports in 1906 was: Sugar, £1,415,000; minerals and metals, £1,188,000; gums and resins, £1,038,000; wool, £520,000; cotton, £471,000; guano, £362,000; copper, £158,000; hats, £90,000; cocaine, £78,000; crude rubber, £76,000; rice, £62,000. According to the report of the United States consul-general at Callao the value of the trade with the principal countries of import and export in 1907 was as follows:

From and to	Imports	Exports
Great Britain	\$7,954,811	\$12,386,959
United States	5,751,996	6,409,657
Germany	4,364,974	1,775,793
France	1,414,380	2,246,875
Belgium	1,264,302	1,273,602
Chile	1,176,709	2,388,161
Australia	1,506,935	

The length of railways in 1908 was 1,337 miles, and some 220 miles were under construction. The greater portion of the railways is worked by the Peruvian Corporation, an English company. The length of State telegraph lines in 1906 was 3,360 miles; of private telegraph lines, 1,180 miles. The port of Callao was entered in 1907 by 710 vessels of 1,278,307 tons, and cleared by 688 vessels of 1,248,835 tons. An American line has recently been established between New York and Iquitos.

FINANCE, ETC. The budget for 1908 estimated the revenue at £2,997,433, and the expenditure at £3,043,032. The principal estimates of revenue were: Customs, £1,362,392; taxes, £948,020; salt monopoly, £145,000; posts and telegraphs, £101,500. The principal estimates of expenditure were: Administration, £431,235; justice and instruction, £428,622; finance and commerce, £422,938; war and marine, £504,169; public works, £304,977. The army is recruited by voluntary enlistment and consists of 7 battalions of infantry of 300 men each; 7 squadrons of cavalry of 125 men each; 1 regiment of artillery of 590 men; and 6 batteries of mountain artillery; with a total peace effective of 4,000 men. There is also a national police force of 2,500 men. The navy at the beginning of 1908 consisted of two protected small cruisers, aggregating 6,400 tons, and one unprotected small cruiser, of 1,700 tons. President José Pardo, whose term expired on Sept. 24, 1908, was succeeded by Augusto B. Leguía.

HISTORY. Early in November, 1907, a detachment of Peruvian troops attacked the Brazilian fort at Leticia, on the frontier, and subsequently occupied the Brazilian town of Tabatinga. But the Peruvian government soon ordered its troops to withdraw and made suitable apology. On Dec. 18, 1907, the first treaty of amity with Chile since the disastrous war of 1879-83 was concluded. On May 29, 1908, President Pardo issued a decree abrogating all previous decrees

and general resolutions concerning the exploitation of leased lands in the mountain country. This measure was made necessary by the fact that the improper exploitation of these lands, with their wealth of timber, rubber, and similar products, had become prejudicial to the interests of the nation. The decree was to remain in force until Congress had enacted necessary laws. Concessions made and contracts entered into in accordance with the earlier laws were, however, not to be affected by the decree. On May 27, 1908, Augusto B. Leguía was chosen President of the Republic. He was born at Lambayeque, Peru, in 1863. The greater part of his life was occupied in business enterprises. He served in the militia in the Peruvian-Chilean war, in which he was present at the battle of Miraflores. Later, he was successively a representative of the New York Life Insurance Company in Peru, Bolivia and Ecuador; the manager of La Sud America, a Peruvian life insurance company; and manager of the British Sugar Company. He also founded several industrial companies. During the Pardo administration he was Minister of Finance, in which capacity he served with distinction.

The new President was inaugurated on Sept. 24. In his inaugural address he praised the work of the outgoing administration and declared that he would follow the wise and progressive programme initiated by his predecessor. The subjects to which he declared he would devote his especial attention were the extension of primary education; the extension of the railways; the encouragement of immigration, especially of artisans and agriculturists; the irrigation of large tracts on the coast, to begin with in the great agricultural districts of Tumbes, Piura, and Santa; the proper sanitation of the principal ports and inland cities; and the amendment of the election law. The first Vice-President, Larrabure Y. Unanue, and the second Vice-President, Dr. Belisario Sosa, were inaugurated on the same date. The new cabinet was composed as follows: Minister of Finance and President of the Cabinet, Eulogio I. Romero; foreign affairs, Meliton F. Porras; interior, Dr. Miguel A. Rojas; justice and instruction, Dr. Manuel Vincente Villaran; war and marine, Capt. Juan Manuel Ontaneda; public works, Francisco Alayza Y Paz Soldan.

PETROLEUM. The production of petroleum in the United States during 1908 was estimated by the *Engineering and Mining Journal* at 184,734,678 barrels, each of 42 gallons, valued at \$131,779,288, as compared with 164,347,930 barrels valued at \$123,260,948 in 1907, or an increase in quantity of 20,386,748 barrels. These figures were in more detail than the preliminary estimate of the U. S. Geological Survey, which placed the production between 175,000,000 and 180,000,000 barrels. In 1908 the petroleum industry continued to show growth and the use of fuel oils in manufacturing and on locomotives continued to increase, especially in regions where coal was obtained only by long hauls. California headed the list of States, producing petroleum with an estimated output of about 45,000,000 barrels, valued at an average of about 50 cents per barrel, as compared with 39,748,375 barrels valued at \$14,699,956 in 1907, or an average of about 37 cents per barrel. Not only was the yield of many companies doubled in 1908 over that of the preceding year, but a number of new wells were

sunk and new country was prospected. In October and November the daily output reached the phenomenal figure of 140,000 barrels. The increase of production of petroleum in Illinois in 1907 continued in 1908 and important development work was done during the year in Crawford, Lawrence, and Clark counties, where by drilling down to the deepest sands the largest wells were found. In the gulf, coastal and North Texas field during 1908 there was a more normal condition of affairs than in the previous year. There was but a moderate output from the Anse Le Bute district, supplied by the original well and a few others in the immediate vicinity, but new gusher fields were developed at Markham and Goose Creek and proved good producers. In Louisiana the Caddo field was developed and seemed to be the most promising of any field in the entire Texas-Louisiana district. The year was marked by a number of suits against the Standard Oil Company, the Security Oil Company, the United Tank Line Company, and other alleged affiliated companies, and there was considerable resistance on the part of the oil companies to various laws of the State. (See TEXAS and STANDARD OIL.) In the mid-continental field, which comprises Kansas and Oklahoma, the Glenn pool near Tulsa, Okla., continued the largest producer and aggregated 50,000 barrels daily throughout the year. Production also increased in the Alluwe area, which was extended north, but in other localities and in Kansas the output declined. In the Appalachian

oil field there was again a decrease in output, but in Southeastern Ohio and West Virginia there were successful drilling operations, and the latter State was considered still to contain territory worth prospecting. The accompanying table gives the production by States and fields for 1907 and 1908:

THE PRODUCTION OF CRUDE PETROLEUM IN THE UNITED STATES.

[In barrels of 42 gallons.]

Engineering and Mining Journal.

Field.	1907	1908
California	40,085,000	45,000,000
Colorado	400,000	(a) 400,000
Gulf—		
Texas	12,350,000	11,804,000
Louisiana	4,620,000	5,886,000
Illinois	24,540,024	38,000,000
Lima—		
Indiana-Ohio	8,030,000	7,287,000
Mid-continental (c)	47,556,906	50,741,678
Kentucky-Tennessee	1,250,000	(a) 1,250,000
Appalachian (d)	25,500,000	24,240,000
Wyoming	13,000	(a) 13,000
Others	3,000	(a) 3,000
Total	164,347,930	184,734,678

(a) Estimated as the same in 1907.

(c) Kansas and Oklahoma.

(d) Pennsylvania, New York, West Virginia and eastern Ohio.

WORLD'S PRODUCTION OF CRUDE PETROLEUM, 1903-1907, BY COUNTRIES.

[Barrels of 42 gallons.]

Country	1903	1904	1905	1906	1907	Percent- age of total pro- duction
					Barrels Met. tons	
United States	100,461,337	117,080,960	134,717,580	126,493,936	166,095,335	63.12

aEstimated.

PETTIGREW, JAMES BELL. An English physiologist, died on Jan. 30, 1908. He was born at Roxhill, Lanarkshire, in 1834; was educated at Glasgow and Edinburgh universities, was appointed Croonian lecturer to the Royal Society, in 1860; president of the Royal Medical Society, in the same year; and in 1875 became Chandos professor of anatomy in the University of St. Andrews, which position he continued to hold, though he had retired from active work, a few days before his death. He was greatly interested in aerial navigation, made a special study of the mechanism of the flight of birds and insects, and constructed several flying machines. He also gave much attention to the anatomy of the vertebrate heart. On these subjects he prepared many papers for the *Transactions* of the Royal Society, and he also published a volume, *Animal Locomotion* (1873), in the *International Science Series*.

PFLEIDERER, OTTO. A German Protestant theologian, died on July 18, 1908. He was born in Stetten, on Sept. 1, 1839, studied under Baur at Tübingen in 1857-61, and for some time thereafter traveled in England and Scotland, where he became familiar with the English language. Thereafter he held pastorates in the State Protestant church, at Heilbronn and Jena, and in 1870 was appointed to the chair of systematic theology at the university in the latter city. Here he remained until 1875, when, upon the death of Troesten, he was appointed to the corresponding chair at Berlin, where he remained during the rest of his life. He served several times as dean of the theological faculty and as rector of the university in 1894-95. Professor Pfeiderer was one of the most influential exponents of modern liberal theology, and the master, as well, of a graceful literary style. His lectures in London, in 1885, and in Edinburgh, in 1894, were published in Eng-

lish, under the titles, *Lectures on the Influence of the Apostle Paul on the Development of Christianity*, and *The Philosophy and Development of Religion* (1894). He also published in English, *The Development of Theology in England Since Kant* (1890). His other works include, *Die Religion, ihr Wesen und ihre Geschichte* (1869-78); *Religionsphilosophie auf Geschichtlicher Grundlage* (1878-93); *Geschichte der Religionsphilosophie von Spinoza bis auf die Gegenwart* (1893), and *Die Entstehung des Christentums* (1905).

PHILIPPINE ISLANDS. A colonial dependency of the United States, the most northerly group of the Malayan Archipelago. The total number of islands is 3,141, the area of the total land surface is 115,026 square miles, and the total population, according to the census of 1903, was 7,635,426, of which 647,740 were wild peoples. The average density of the population was 67 per square mile. The area and population of the most important islands are given in the accompanying table:

Island	Area in sq. miles	Population	Population per sq. mile
Bohol	1,441	243,148	169
Cebu	1,762	592,247	336
Leyte	2,722	357,641	131
Luzon	40,969	3,798,507	93
Marinduque	352	50,601	144
Masbate	1,236	29,451	24
Mindanao	36,292	499,631	14
Mindoro	3,851	28,361	7
Negros	4,881	460,776	94
Palawan	4,027	10,918	3
Panay	4,611	743,646	161
Samar	5,031	222,690	44

During January, 1907, the Bureau of Health took a census of Manila, which showed the population to be 223,542 as against 219,941 given by the official census in 1903. There was an increase of 18 per cent. in the number of Americans, 2 per cent. in the number of Filipinos, 14 per cent. in Spaniards, and 27 per cent. in other nationalities. The Chinese population showed a decrease of 15 per cent. In 1906 a Bureau of Agriculture was established, composed of three divisions, administrative, plant industry, and animal industry.

AGRICULTURE. Owing to the resignation of the Director of Agriculture on June 3, 1907, and to difficulties in keeping the working force up to the desired standard, the bureau had not done as effective work as had been hoped for during 1907. The chief agricultural productions of the islands are abaca, or manila hemp, the fibre of a fruitless variety of banana plant; cocoanuts, generally in the form of the dried coconut meat, called copra; sugar, exported in a form having the lowest degree of polarization known in commerce, and tobacco exported in the leaf, also in cigars and cigarettes. In addition to these and in excess of most of them, except hemp, is the production of rice, which constitutes the staple food of the inhabitants. In the first few years of the American occupation during the insurrection and the continuance of guerilla warfare and the prevalence of Ladroneism, many of the rice fields lay idle and the importation of rice reached \$12,000,000 gold, or about four-tenths of the total imports. After the restoration of better conditions, the production of rice increased so that the amount of rice imported in 1907 was only \$3,500,000 gold. Among other products

are maguay and sisal corn, coffee, cocoa, garden truck, and fruits. The exports of hemp in 1908 were valued at \$17,311,758. The value of the export of hemp in 1907 was \$21,085,081. Of the amount exported, American purchasers represent about half. The increase in this industry may be seen by a comparison with the average annual exportation under Spanish rule for the years 1890 to 1894, when the hemp exported was valued at \$3,934,460. There is much good land available for sugar cultivation in the Philippines, but there is very little of it as good as that in Cuba, and the amount of capital involved in developing it is so great that a possibility of the extension of the sugar production is quite remote. The exportation has had a marked decrease since the Spanish days when the highest export of sugar reached 265,000 tons to all the world. The value of the export in 1908 was \$5,664,666, as against \$3,129,194 in 1907. The tobacco trade in 1908 showed a decreased export activity in both leaf and manufactures and reached a value of \$2,714,546. This was a decrease of \$404,648 over the record of 1907. In several provinces where coffee was formerly grown in quantity, efforts to produce it have been abandoned and hemp has been substituted as a more profitable crop. During the American occupation agriculture has been subject to the violent destruction which is more or less characteristic of tropical countries, due to typhoons, lack of care, cultivation, locusts and other insect pests. The most serious drawback, however, has been the rinderpest, which carried off in two or three years 75 or 80 per cent. of the draft animals in the islands. The agriculture of the island has been struggling to recover from this blow for four or five years. Appropriations were made by Congress to remedy the loss if possible by bringing in cattle from other countries, but it was found that these cattle, not being acclimated, died, most of them before they could be transferred to the farms. It has been found that nothing can restore former conditions except the natural breeding of the survivors, and five or six years will be required to restore matters to their normal condition. An Indian disease called surra, which it has been found impossible to cure, has carried off 50 per cent. of the horses of the islands. The work in relation to public lands was greatly increased in 1907, owing to the greater activity in the applications for public lands, due largely to the efforts of the bureau to attract attention to their desirability. In 1907 there were 12,029 applications for homesteads, free patents, and mineral lands, as against 3,392 applications in all the years previous. A great portion of the land in the islands is still without cultivation.

MINERAL RESOURCES. In 1908 the Bureau of Science at Manila undertook the preparation of an annual report of the mineral resources and production of the islands, and during the year the first bulletin was issued, giving the production of commercial mineral products during the year 1907. From this publication it is found that coal has been discovered in nearly every island of the Archipelago, in many places associated with petroleum. This coal is sub-bituminous, having the appearance and specific gravity of lignite, but the carbon content and streak of a bituminous coal. This coal has stood good tests in stationary and marine en-

gines, but it is not satisfactory for all requirements. Natural gas is found in Rizal province and on the island of Marinduque. Petroleum occurs on the east coast of Tayabas province, where prospecting was carried on in 1908. It is also found on the west coast of the island of Cebu. Cement lime, building stone, abrasives, gypsum, phosphate, salt, sulphur and mineral paints are among the other known metallic minerals found in the islands. Gold is the first in importance of the metallic mineral resources of the Philippines. It has been found in most of the provinces of the Archipelago, but chiefly in the provinces of Benguet, Masbate and Ambos Camarines. A small amount of gold is produced by placer mining, but this method of mining is not considered particularly successful in the Philippines. Copper is ranked second among the mineral resources, but hardly a dollar's worth has been produced since American occupation. This is due to the absence of smelters in the islands and to the difficulties of transportation from the mountain regions where the ore has been found to the nearest port to which the product could be shipped to foreign smelters. Silver has been found in small quantities, and as an associate of gold it is found in many points. During 1907 no development work was performed on any of the lead deposits of the Philippines, nor was there any developments in the iron industry during that period. Tellurium in the form of calaverite and sylvanite has been found occurring in fine streaks in Benguet and Lepanto ore. No authenticated discovery of tin has been made in the Philippine Islands. The production of metallic and non-metallic minerals in 1907 was as follows: Gold, 4,540 ounces; silver, 83 ounces; iron, 436 short tons; coal, 4,545 short tons, all from Albay Province. Statistics of clay, guano and other minerals have not yet been tabulated.

COMMERCE. In spite of the general financial depression, which was almost universally evidenced by the decline in both foreign and domestic trade, the Philippine Islands not only held their own during the fiscal year 1908, but closed the year with an increased volume of trade. This result is not attributable to any manipulation of figures or series of incidents favorable to Philippine trade, but obtains in the face of adverse conditions arising from general depression. It is directly due to advanced industry in the Islands as is shown clearly by the fact that the exportation of each of the principal products, hemp, sugar, and copra, except tobacco were substantially increased in quantity, which prevented the decline in the total value of trade which would have taken place had the country been at a standstill in the matter of production.

The total value of the foreign trade for the year aggregated \$63,748,561, an increase of \$1,240,731 over 1907, and exceeded in value that of any previous year in the history of the Islands except 1903 when the total values were shown as slightly in excess of \$66,000,000.

The value of merchandise purchased abroad was \$30,918,745, against local products exported to the value of \$32,829,816, leaving a balance of trade in favor of the Islands of \$1,911,071, thus reducing the total balance which had accumulated on the other side since American occupation and prior to 1905, to \$2,175,450, and the average balance of trade in favor of impor-

tation during the past ten years to \$217,545. The main obstacle to wiping out the balance of trade against the Islands, which should under normal conditions be large creditors in the world's markets, has been the forced importation of rice on account of inability, through loss of work animals and other local misfortunes, to produce this principal article of food at home in sufficient quantities to supply the necessities. During the past ten years \$60,082,108 has been sent to the East Indies for the purchase of rice. Such importations have been diminished since 1904, but they are still proportionately enormous, amounting in the fiscal year 1908 to \$5,861,256 or 19 per cent. of all imports. A controlling factor in the year's trade which prevented the large increase in values that might have been expected from the greater quantities of products exported, was the unprecedented decline in the value of hemp, due no doubt to the contraction of business abroad resulting from widespread financial depression. While the quantity exported in 1908 was 6,121 tons above the average annual exportation since 1898, the percentage of value of the total exports had fallen to 52.7 per cent. The shipments of 1907, which amounted to 112,895 tons, were invoiced at \$21,085,081, while the larger shipments of 114,005 tons in 1908 were valued at \$17,311,808.

Sugar, which is the second product of importance, both in value and tonnage, aided in sustaining the volume of trade by an increased exportation as well as proportionate value, over the quantity and value marketed during the preceding year. During 1908 the sugar exportations aggregated 149,323 tons, valued at \$5,664,666, an increase of 30,928 tons and \$1,730,206 in value over those of 1907, being the highest record in sugar transactions since 1898. Exportations of copra for 1908 aggregated 75,257 tons, invoiced at \$5,461,689, an increase in quantity of approximately 50 per cent. over the average yearly shipments, and a still greater increase over the year 1907, when 48,306 tons, valued at \$4,053,193, represented the foreign sales. Although the total exportations of tobacco showed a falling off in value from \$3,129,194 during 1907 to \$2,714,546 in 1908, they were still higher than in any previous year since American occupation. The decreased value in foreign sales was principally in the manufactured product, 6,868,179 pounds less having been shipped than in 1907, the total exportation being 23,264,901 pounds, valued at \$1,592,123. The comparative export figures for the years 1906, 1907 and 1908 are shown in the following table:

Articles	1906	1907	1908
Hemp	\$19,446,769	\$21,085,081	\$17,311,758
Sugar	4,863,865	3,934,460	5,664,666
Tobacco, and manufactures of.....	2,389,890	3,129,194	2,714,546
Copra	4,043,115	4,053,193	5,461,680
Miscellaneous	1,173,495	1,511,429	1,663,917
Total	\$31,917,134	\$33,713,357	\$32,816,567

The merchandise imported into the Philippine Islands during the fiscal year 1908 comprised manufactured articles and natural products from many and widely distributed sources throughout the world.

The following statistics cover the leading articles of import and the leading countries supplying them:

	1907	1908
Wheat flour:		
United States.....	\$ 370,271	\$ 507,235
Australasia	518,580	536,322
Cotton cloths:		
United States.....	1,016,036	533,693
United Kingdom.....	3,013,769	3,231,425
Switzerland	280,372	406,441
East India	530,687	532,526
Knit fabrics:		
United States.....	6,816	10,412
Germany	198,967	241,014
Spain	622,853	434,650
Yarn and thread:		
United States.....	2,144	5,024
United Kingdom.....	729,992	686,068
Switzerland	153,302	161,794
Japan	255,406	205,284
Boots and shoes:		
United States.....	221,018	338,929
Spain	59,000	86,391
Condensed milk:		
United States.....	92,838	96,710
United Kingdom.....	161,486	210,666
Illuminating oil:		
United States.....	551,699	619,545
Dutch Indies.....	198,808	144,213

The large quantity of cotton goods in addition to the general merchandise received from the United Kingdom places that country at the head of the list, while the value representing importations from the French East Indies is due almost entirely to the large amount of rice from Saigon. In addition to the classes of merchandise enumerated in the table above, manufactures of iron and steel were imported to the value of \$2,164,907 and 37 per cent. of this covered American manufactures as against 34 per cent. in 1907. Imports of miscellaneous machinery, exclusive of sewing machines and sugar machinery, aggregated in value \$433,803, of which \$290,598 represents American manufacture. The heaviest importation of any distinct classes of iron was that of sheets and plates, aggregating in value \$316,110 of which importations from the United Kingdom were represented by a value of \$206,214 and the United States by a value of \$96,411. The greater portion of importations of canned beef, bacon and salted and pickled pork during 1908 consisted of American products, although the chief sources of the supply of meats were Australia, China, and other neighboring countries. The importations of wheat flour during 1908 amounted to 256,066 barrels, which were invoiced at \$1,044,570. Practically all this flour was received either from Australia or the United States, 133,232 barrels having been imported from the former and 122,624 from the latter source. The invoice value of the bread stuffs, exclusive of flour imported, was \$263,396 as compared with a value of \$329,632 in 1907. Other important importations are the following: Malt liquors, valued at \$90,592; illuminating oil, \$806,112; boots and shoes, \$451,421; chemicals, drugs, and dyes, \$314,978; opium, \$143,670, a decrease over the importation of 1907 which was \$369,617. This decrease was due to the prohibition of the use of this drug except for medical purposes by an act of the Philippine Commission which became effective Mar. 1, 1908.

(See OPIUM.) The exports of coal in 1908 amounted to 213,958 tons, valued at \$547,220. Of this amount, 208,316 tons came from Australia. Importations of manufactures of paper in 1908 aggregated in value \$526,434 as against \$508,754 in 1907.

EDUCATION. Public educational work in the Philippines is performed under the Bureau of Education with a central office at Manila. This Bureau has 36 divisions, each in charge of a Division Superintendent, embracing in all 460 school districts each in charge of a supervising teacher. The total number of schools in operation during the fiscal year 1908 was as follows: Primary schools, 3701, an increase of 266 over 1907; secondary schools, 193, an increase of 31; art and trades schools, 35, an increase of 3; agricultural schools, 12, an increase of 7; domestic science schools, 30, an increase of 13; provincial high schools, 38, an increase of 2. The teaching force maintained directly by the Insular government is approximately 1572, of which 877 are American teachers and 695 Filipino Insular teachers. This is an increase of 51 American teachers and 240 Filipino teachers over the force so provided June 30, 1907. The total enrollment during the school year was 486,676 as compared with an enrollment of 479,978 in 1907. The average enrollment by months was 339,243 of whom 212,273 were boys and 126,970 were girls. The average daily attendance was 270,732. By act of the Philippine Commission the sum of 3,510,000 pesos was appropriated for current expenses of the Bureau of Education during the fiscal year 1908, and for the work of the fiscal year 1909, 3,300,000 pesos were appropriated. Up to Sept. 9, 1908, allotments for school construction work in the different provinces on the Islands had been made to the amount of 997,468.74 pesos. The total appropriation for this work was 1,000,000 pesos, leaving a balance on hand of 2,531.26 pesos. Of the sum appropriated, 330,275 was for provincial high school buildings, 279,628 pesos for intermediate schools, 224,612 pesos for schools of arts and trades, 69,500 pesos for agricultural schools, 64,200 pesos for schools of domestic science, and dormitories, 23,252 pesos for a school of fisheries and 6,000 pesos for a school of property. In 1908 there were constructed 432 school houses, and a total of 2696 school houses of all kinds have been constructed in the Islands since the creation of the present Board of Education. During the last two years there were either built or purchased by the government, 2 provincial high schools, 22 domestic science schools, 10 agricultural schools, 18 schools of arts and trades, 101 intermediate schools and 548 primary schools.

A plan of secondary instruction has been prepared by the Department of Education. This plan provides for a secondary course of six years duration, preceded by training in the ordinary elementary branches, equivalent to, although not necessarily identical with that given in the public primary and intermediate schools of the Islands, whose two courses, primary and intermediate, embrace seven grades, normally of one school year of 40 weeks for each grade. The minimum requirements of secondary instruction necessary to obtain governmental approval will not be less than four units for each year, making a maximum total of 24 units

for the six-year course. This plan is intended to apply to private schools.

School work among the non-Christian peoples of the Philippines, for the extension of which a special appropriation of 75,000 pesos was made in 1907, was continued throughout 1908 with decided success. Schools for the Negritos or Aetas of whom there are estimated to be from 25,000 to 30,000 have been opened in the Bukao river valley in the provinces of Zambales; in the Tarlac river valley; in the mountains back of Florida Blanca, province of Papanga, and in the provinces of Ambros Camarines and Antique. In these schools are taught reading, writing, knowledge of money values and simple business figuring. Schools have also been started among the primitive Malayan people among the Visayan Islands and Northern Mindanao. Industrial boarding schools and village primary schools have been established among the Igorots and other island people of Northern Luzon, of whom there are several hundred thousand. As fast as the native boys can be trained as teachers, village schools will be opened in the different communities. Similar schools were conducted in Igorot and Tinguan in the provinces of Ilocos Sur and Ilocos Norte. Among the subjects taught by the Igorots are basket making, truck gardening, pottery, blacksmithing, carpentry, cloth weaving and brass casting. The results obtained in these schools have been, on the whole, very satisfactory.

Substantial progress was made in the organization, equipment and operation of the Philippine medical school during 1908. A number of new instructors and demonstrators were appointed during the year. The total number of students in the school year 1908-9 was 67. From Sept. 1, 1907 to June 30, 1908, 10,869 patients visited the clinic and received treatment.

The appropriation bill for the Bureau of Education for 1908-9 provides for the maintenance in the United States for 130 Filipino students. Up to the end of the year 1908, 60 students had returned to the Islands upon the expiration of their term of appointment and all have received government appointments, 40 as teachers. During 1908-9 43 more are expected to return, four of them being young women. The first act of the Philippine Assembly and of the Philippine Legislature was to appropriate the sum of 1,000,000 pesos for the construction of public school buildings in the barrios or outlying hamlets of the Islands. See paragraph *Legislation*.

RAILROADS. Very satisfactory progress has been made in the construction of railroads during the year. Of track 269.5 kilometres (167.4 miles) were laid and 286.4 kilometres (177.9 miles) of line opened for business, and at the close of the fiscal year there were 689.8 kilometres (428.4 miles) of line in operation in the islands, as compared with 196 kilometres (121.7 miles) at the close of Spanish sovereignty, or over three and one-half times as much. There was laid 37.5 per cent. more track during the past year alone than was in existence in the islands when the Americans landed. Including sidings and second track there was a total of 841.9 kilometres (522.8 miles) at the close of the year.

The following table shows in kilometres the extent of line, not including sidings and second lines, the construction of which has been authorized by law, and the amount constructed:

	Authorized	Constructed, in operation	Constructed, not in operation	To be constructed
Manila Railroad Company...	1,100.0	473.3	33.1	593.6
Manila Electric Railroad and Light Company.....	45.0	39.8		5.2
Manila Suburban Railways Company	19.9	9.9		10.0
Tarlac Railway Company....	20.6	20.6		
Daet Tramway Company.....	7.2	7.2		
Philippine Railway Company	461.0	127.0	13.4	320.6
Insular Coal Company.....	12.0	12.0		
Total	1,665.7	689.8	46.5	929.4

An act of the Philippine Commission created a board known as the "board of rate regulation," for the regulation of rates charged by public-service corporations. This board is composed of the Governor-General, the Secretary of Commerce and Police, and the supervising railway expert, and the powers given are in general similar to those conferred on the Interstate Commerce Commission by Congress.

POSTS AND TELEGRAPHS. At the end of the fiscal year 1908 there were 540 post offices in operation, an increase of 35, or nearly 7 per cent., over 1907. A free delivery municipal letter carrier service was established in 31 municipalities. At the close of the fiscal year there were 5389 accounts in the postal savings banks, as compared with 2331 at the beginning of the fiscal year. The amount of deposits in the bank on June 30, 1908, was 1,031,994 pesos, as compared with 509,463 pesos on June 30, 1907. Over 44 per cent. of the depositors are Filipinos. There were on June 30, 1908, 4898 kilometres of insular telegraph lines, 3468 kilometres of telephone lines, and 2176 kilometres of cables. The total length of the Insular telegraph, telephone, and cable lines at the close of the fiscal year was 10,542 kilometres (6546 miles), as compared with 7153 (4442 miles) at the close of 1907.

FINANCE. The revenues of the Philippine government, exclusive of all items of refundable character, were, for the fiscal year ended June 30, 1907, \$17,445,489.49. The revenues in 1908 for the same period were \$17,972,929.03. Of the revenues of 1907, \$11,149,619.25 were received from insular sources; \$4,604,528.31 from provincial sources; \$1,691,341.93 from the city of Manila. The expenditures for the fiscal year 1907 were \$14,704,852.44, as against \$16,974,262.67 for the fiscal year 1906. These expenditures were divided as follows: Insular, \$8,408,012.84; provincial, \$4,736,038.20; city of Manila, \$1,560,801.40. The total bonded indebtedness of the islands was, on June 30, 1907, \$13,500,000, divided as follows: Land purchase bonds, \$7,000,000; Philippine public improvement bonds, \$3,500,000; Manila sewer and water bonds, \$3,000,000. To meet the interest on the principal of these bonds, ample sinking funds have been provided, and the bonds are now held on the market at prices well above those for which they were originally sold. The Insular treasury's cash balance on June 30 1907, was \$25,033,490.93. Loans were made to the provinces during the year to the amount of \$481,137.55. The cost of the provincial government was \$1,132,743.62. The

Friars' Lands funds amounted to \$6,670,548.06. The question of taxation is an important one in the islands, and complaints have been made that interior taxation has increased under the American rule, and that the burdens of government by the Commission have been greater many times than those which were imposed by the previous régime. A comparative statement of taxes imposed by the Philippine Commission and by the Spanish government shows that less interior tax to the amount of \$746,000 was imposed by the Commission in 1906 than was imposed by the Spanish government in 1897, the respective figures being \$8,453,000 and \$9,199,000. It is true that the bankers, farmers, merchants, and capitalists paid much more in taxes under the American administration than was exacted from them by the Spanish rule, but on the other hand, a heavy burden of taxation has been taken from the poorer classes and those less able to bear the burden. Under the former the graded cedular tax was collected on men and women of full age, whereas since the transfer of sovereignty a tax of but 50 cents has been exacted, and that from men only. From this tax the Spanish government derived over \$4,000,000 annually, while less than \$900,000 has been received from the source under American rule. One million, two hundred and fifty thousand men were liable under Spanish laws for the prestacion personal tax of 15 days labor on public works. From this the government received not less than \$1,500,000 annually. This tax has been eliminated by the American government. On these two items alone the mass of the people have been relieved from the burden of taxation of more than \$4,500,000, all of which loss has been recouped from the imposition of the land tax and internal revenue tax, with the exception of \$746,000, which represents a fair gain of the people, taken as a whole. The Philippine government has been self-sustaining since its installation. The various governmental departments, including schools, scientific institutions, construction and maintenance of roads, and public buildings, the maintenance of a constabulary of the strength of 5000 or 6000 men, and other activities have been supported by the Philippine revenue. The expenses of those portions of the army and navy stationed in the islands have been met by the government of the United States.

BANKS AND BANKING. The total resources of the commercial banks in the Philippine Islands, exclusive of the Bank of Zamboanga, was, at the end of the fiscal year 1907, 34,104,715.30 pesos, as against 30,703,379.96 pesos in 1906. In accordance with an act passed by the Philippine Commission in 1906, a postal savings bank was established and began business on Oct. 1, 1906. On June 30, 1907, there were deposited in this bank funds to the amount of 490,000 pesos. The agricultural bank, which was authorized by Congress in 1907, was not established during that year, as no acceptable proposition was made by private capital for this enterprise. The Insular treasurer recommended that out of the general funds, \$1,000,000 be set apart for the Philippine Legislature for the founding of an agricultural bank, to be supervised, operated, and controlled by the Treasury Bureau.

HISTORY.

The most important political event of the fiscal year 1908 was the opening on Oct. 16, 1907, of the Philippine Legislature, which consists of the Philippine Commission as the Upper House

and the Philippine Assembly as the Lower House. There were three sessions held by the Legislature, the inaugural session from Oct. 16, 1907, to Feb. 1, 1908; the first session from Feb. 3, 1908, to March 21, 1908, and a special session from May 22, 1908, to June 19, 1908. Mention of the important measures passed by the Legislature will be found in the paragraph below.

On May 12, Congress authorized the increase of the Philippine Commission by one member, and empowered the President to appoint an additional secretary when, in his opinion, such a course was necessary to the interest of the service. On July 1, Hon. Gregorio Araneta, then Attorney-General of the Philippine Islands, was appointed Secretary of Finance and Justice to fill the vacancy caused in that office by the appointment of Hon. Henry C. Ide as Governor-General of the Philippine Islands, and Newton W. Gilbert, Judge at Large of the Court of the First Instance, was appointed a member of the Philippine Commission in the place of Benito Legardo, who resigned to become one of the Delegates to Congress. The additional position of member of the Commission, created by Congress, was filled by the appointment on July 6, 1908, of Hon. H. Rafael Palma, a lawyer and a member of the Philippine Assembly from the Province of Cavite.

CONGRESSIONAL LEGISLATION. By act of Congress approved April 29, 1908, the provisions for the application of the coastwise laws of the United States to the Philippine Islands was permanently suspended.

During the 60th session of Congress provision was made for the promotion of officers of scout companies to include the grade of captain.

Congress also authorized the designation by the Philippine Commission of one Filipino cadet for each class at the United States Military Academy. A bill with similar provisions, authorizing the appointment of five Filipinos to receive instructions at the United States Naval Academy was also introduced in Congress. It was referred to the Committee on Naval Affairs, but received no action.

By an act approved March 26, 1908, Congress appropriated \$403,030.19, payable to the representative of the Roman Catholic Church in the Philippine Islands, the Archbishop of Manila, as trustee, in full satisfaction of all claims arising out of the use of church property by the troops of the United States during and following the war with Spain and the Philippine insurrection. The claims presented amounted in total to \$2,442,963.13, and the award recommended by the board on church claims was \$363,030.19, with a further additional recommendation of a payment of \$40,000 for the spoliation and loss of sacred ornaments, images, and vestments, provided that Congress should, as a matter of equity, desire to render such compensation to the church.

By virtue of a provision in the Sundry Civil Act, Congress authorized and directed the Secretary of War to aid the people of the Philippine Islands in providing and maintaining an appropriate and creditable exhibit of the resources and products of those islands at the Alaska-Yukon-Pacific Exposition to be held at Seattle, Wash., in 1909, and for this purpose provided an appropriation not to exceed \$25,000.

LAWS PASSED BY THE PHILIPPINE LEGISLATURE. At the inaugural session of the Legislature the most important bill passed was one appropriating 1,000,000 pesos for the construction

of barrio schools. An act was passed providing that merchandise in bonds for customs duties may be withdrawn at any time for consumption, for transportation to another port, for exportation, or for delivery on board a vessel of the United States or foreign vessel, for use on board such vessel as ship's stores. Measures were passed cancelling laws made by the Insular government to certain provincial and municipal government prior to Oct. 15, 1907. An appropriation of 1,100,000 pesos was made to be expended, in the discretion of the Bureau of Agriculture, for the purpose of combating and exterminating animal diseases. The Governor-General was authorized to convey insular property to provinces and municipalities for public school purposes. The sum of 3,024,000 pesos was appropriated for public works and improvements. Provision was made for the construction of a capitol building, and a committee was created to prepare plans therefor. A Philippine public library was provided for, and suitable provision was made for its maintenance. The sum of 750,000 pesos annually was provided for the promotion, establishment, and maintenance of irrigation projects in the islands. The sum of 150,000 pesos was appropriated for the purchase and preparation of land for cattle quarantine stations in the cities of Manila, Cebu, and Iloilo. An employers' liability law was passed. Provision was made for the sale of unoccupied friar lands, and for the payment therefor in annual installments. A bill was passed providing for the establishment of a university in the Philippine Islands.

MOUNTAIN PROVINCE. Difficulties of the administration led to the recommendation of the establishment of a province to be known as the "Mountain Province," and to include as separate sub-provinces, each with its lieutenant-governor, Benguet, Amburayan, Lepanto, Bontoc, Kalinga, Apayao, and the Ifugao country of Nueva Vizcaya, the latter being coextensive with the former Spanish comandancia of Quiangan. It was further recommended that the capital of the province be at Bontoc, which has a cool and most healthful climate, and is the central point from which the main natural lines of communication radiate.

The Commission approved these recommendations and made them effective by act No. 1876, passed Aug. 18, 1908.

Under the new arrangement, with a lieutenant-governor constantly present in each sub-province, the governor will be free to go at once to any place where his assistance is needed or where he desires to investigate conditions. He will be able to establish and carry out a fixed policy throughout the entire extent of this great mountain region, which extends from the southern boundary of Benguet to the extreme northern end of Luzon, and will be sufficiently familiar with conditions in each sub-province, so that in the event of the death, resignation, or removal of a lieutenant-governor he can immediately assume control.

It is believed that this reorganization is the most important forward step yet made in establishing law and order and in bringing about a general improvement of conditions throughout the northern mountain region of Luzon.

CITY OF MANILA. By an act of the Philippine Legislature a change was made in the government of the city of Manila. The Advisory Board, which was composed of 13 members, one member being appointed by the governor-general from

each of the 13 districts of the city of Manila, was abolished. The municipal board was reorganized and is now composed of three appointive members, one *ex officio* member (the city engineer), and two elective members.

The installation of a sewer system so intimately connected with the sanitation of the city, is nearing completion. During 1908 24.4 miles of street sewers were laid, giving a total of 28.1 miles laid and leaving only 13.6 miles of the total contracted for. Pumps and pump houses have been contracted for; work on the latter has begun, and the entire system should be in working order before the close of the fiscal year ending June 30, 1909. Manila will then be the only city in the Orient having a complete water-carriage system for the disposal of its sewage.

OTHER EVENTS. The construction of the fortifications on Manila Bay were carried on during the year. Defenses were being erected on Corregidor, which will command the main ship channel into Manila Bay. A battery of 12-inch guns and 8-inch mortars will be located on a bluff, 600 feet above the sea level. Three other islands at the entrance to the Bay, El Fraile, Caribo, and Cabello, were also being fortified. On Sept. 24, great loss of life and property damage occurred through a typhoon which struck the middle part of the island. The disaster extended over the islands of Leyte, Panay, Masbate and Samar and for a time all cable communication was severed. The visit of the Atlantic Fleet to the Philippines will be found noted in the article UNITED STATES, section Navy.

OFFICERS: Governor-General, James F. Smith; Vice-Governor and Secretary of Commerce and Police, W. Cameron Forbes; Secretary of the Interior, Dean C. Worcester; Secretary of Finance and Justice, Gregorio Araneta; Secretary of Public Instruction, W. Morgan Shuster. Hon. Ignacio Villamor, judge of the sixth judicial district, was promoted on July 9th, 1908, to Attorney-General in the place of Hon. Gregorio Araneta who was appointed Commissioner and Secretary of Finance and Justice. Mr. George R. Harvey, Assistant Attorney-General, was appointed Solicitor-General.

PHILOLOGICAL ASSOCIATION, AMERICAN. A learned society organized in 1869, from the classical section of the Oriental Society. Its object is advancement and diffusion of philological knowledge. The Association held its annual meeting at Toronto, December 28-30. Many important papers were read. The annual president's address was delivered by Charles E. Bennett. The thirty-eighth annual volume of the *Transactions and Proceedings of the Association* was published in 1908. The Association has a membership of about 600. The president is Charles E. Bennett, and the secretary, Frank Gardner Moore. See PHILOLOGY.

PHILOLOGY, CLASSICAL. The present article, though concerned primarily with 1908, will occasionally take cognizance of work of an earlier time. Few new epoch-making books were published during the year. Some important books, however, were revised or made advance toward completion; much good work appeared in monographs and articles. Some important editions for school and college purposes appeared, but these lack of space compels us to pass in silence.

In the field of inscriptions we may note a new part of *Inscriptiones Græcæ*, with 520 inscriptions from Amorgos; the fifth part of *Inscriptiones Græcæ ad res Romanas pertinentes*, with inscriptions from Egypt; the third edition of H. Roehl's *Imagines Inscriptionum Græcarum Antiquissimarum*, and especially the first volume of W. Larfeld's *Handbuch der griechischen Epigraphik*, an indispensable work (volume 2 appeared in 1902), dealing with the history of Greek epigraphical study from ancient times to the present, with the material, execution, cost, interpretation, etc., of inscriptions, and with Greek alphabetical and numeral signs.

On Greek papyri the reader may consult F. G. Kenyon, *Greek Papyri and Recent Discoveries*, in the *Quarterly Review*. New fragments of Menander were published at Cairo, in November, 1907, as edited by G. Lefebvre. The manuscript, variously ascribed to the second or the late third century A.D., contains parts of four plays; of one about 500 verses survive, of each of two others about 350, of a fourth about 70. We thus have material for estimating Menander for ourselves. Numerous articles dealing with these fragments have already been published, e. g., by Leo in *Rheinisches Museum*, and E. Capps, *The Plot of Menander's Epitrepontes*, in *American Journal of Philology*. (See ARCHÆOLOGY.)

Volume 5 of the Oxyrhynchus Papyri contained 800 lines of a Greek historian (see below), besides important new fragments of Pindar. The 270 new verses of Pindar give parts of at least nine poems, some of which throw important light on the previously known poems of Pindar. The volume also reproduces a small, nearly complete, leaf of an uncanonical Gospel, which gives a discussion between Jesus and a chief priest in the temple at Jerusalem. In a complete vellum manuscript of the four Gospels, purchased in Cairo by Mr. C. L. Freer, of Detroit, of uncertain date, were found certain verses following Mark 16. 14; these verses, though mentioned by Jerome, had not previously been found in any extant manuscript of the Gospels.

Late in 1907 appeared a most important work, *Nomina Sacra*, by Professor Traube, of Munich. It discusses abbreviations of theological terms, such as *deus*, *dominus*, *Christus*, in pre-minuscule manuscripts. Forms such as *DO=deo*, *DNO=domino*, in which the final letter of the word is written with the initial letter, or with the initial letter of one or more syllables, Traube calls contractions. Contractions such as *DS=deus*, he says, were at first used as imitations of Greek contractions such as *ΘΣ=Θεός*, and were, besides, at first employed only when *deus* meant God in the Christian sense; the contraction was first used of a pagan god in the sixth century. If sound, this demonstration supplies important criteria for dating extant majuscule manuscripts or lost majuscule archetypes, and the book will be of prime importance to all students of text-criticism.

In the field of mythology and religion we must notice first the Congress for the History of Religions, held at Oxford in September; the papers read have been published in a volume of *Transactions*. A convenient account of the Congress will be found in the *New York Evening Post* for October 3. Professor Toutain published a new volume of his *Les Cultes Païens dans l'Empire Romain*; in this he protests

against the uncritical application of anthropological theories, especially the totemistic. J. Adam published *Gifford Lectures on the Religious Thinkers of Greece*, dealing especially with Pindar and Euripides. Mention may be made of Reinach's *Cultes, Mythes et Religions*, which treats many problems of Greek mythology and religion, especially the Aktaion story and the Prometheus myth; of a paper by Radet, entitled *Nike Volante*, in *Akademie des Inscriptions et Belles-Lettres*; of a lecture on Apollo, by Wilamowitz (Oxford Press); of H. L. Axtell's dissertation on *The Deification of Abstract Ideas in Roman Literature and Inscriptions*; of a paper by Frazer, on *St. George and the Parilia*, in *Revue des Études Ethnographiques et Sociologiques*, in which he argues that the object of both festivals was to protect the flocks against wolves and witches at the critical time when the herds are first driven out to pasture in the spring; of a paper by C. H. Moore, on *The Distribution of Oriental Cults in the Gauls and the Germanies*, in the *Transactions of the American Philological Association* for 1907; of J. W. Hewitt's *The Propitiation of Zeus*, in *Harvard Studies*, volume 19; and finally of two articles in the eleventh half-volume of Pauly-Wissowa's *Real-Encyclopädie*, the one by Keune on *Epona*, a deity of beasts of burden in the northern and western provinces of the Roman Empire, the other by Körte, on the Etruscans, which briefly discusses Etruscan religion. In Roscher's *Lexikon* there is an article on *Poseidon*.

As noted above, the publication of the fifth volume of the Oxyrhynchus Papyri has made accessible the text of the new Greek historian discovered in 1906. The 800 lines cover events of 396-394 B.C., and throw important light on the anti-Spartan coalition of that time and on the Bœotian confederation. Scholars have not reached agreement concerning the authorship of this fragment. Theopompus and Cratippus both have their champions. Most important are the concluding volumes of R. W. Macan's exhaustive edition of Herodotus; these deal with Books 7-9, and contain most elaborate discussions of the composition of these books (Macan believes that Herodotus composed them before the others) and of various questions connected with Xerxes's invasion of Greece, especially the battle of Salamis. Excavations at Sparta have shown that the peculiar discipline associated with the name of Lycurgus was of late origin, probably of the sixth century B.C., and so are held to prove that Lycurgus was not a historical personage. A. Solari, in *Ricerche Spartane*, deals with the navy and the ephorate at Sparta. Kromayer, *Die antiken Schlachtfelder in Griechenland*, volume 2, treats minutely the campaigns of various Greek kings against Rome; the author holds that these kings, though defeated, really handled their armies with much skill. We may note, finally, the article on *Ephorus*, in Pauly-Wissowa, *Myres, History of the Pelasgian Theory*, in the *Journal of Hellenic Studies*, Wilamowitz's lecture on *Greek Historical Writing* (Oxford Press), and J. B. Bury's *Ancient Greek Historians*, a series of lectures delivered at Harvard University, giving a survey of Greek historiography down to the first century, with special attention to Herodotus, Thucydides and Polybius. B. Modestov, in *Introduction* *

l'Histoire Romaine, has collected, criticized and arranged the facts and theories about the peoples of Italy from palæolithic days down to the coming of the Etruscans. The Etruscan question, too, is considered; Modestov holds that the Etruscans came from the East by sea, as old tradition declares. Körte, in the article in Pauly-Wissowa, already mentioned, had taken the same view. Pais's essays on the history of Magna Græcia and Greek Sicily, which emphasize the part those districts played in the early history of Rome, have been collected and translated from the Italian (Chicago University Press).

Of the first rank is T. Rice Holmes's exhaustive work on *Ancient Britain and the Invasions of Julius Cæsar*, whose aim is to tell the story of man's life in Britain from the earliest times down through the invasions of Cæsar. There is an elaborate account in the first five chapters of Britain in the prehistoric period; chapters six and seven discuss Cæsar's invasions; chapter eight sums up the results of those invasions. There are also elaborate notes and appendices, which treat, among other things, the ethnology of ancient Britain, the place of Cæsar's landing in Britain, and Portus Itius, whence Cæsar set sail (Holmes identifies this with Boulogne; he holds, also, that Cæsar landed in eastern Kent). The book is the product of enormous learning and profound industry; the chapters on the early archæology of Britain are especially valuable, as putting in intelligible form the results of study in fields which lie outside the range of most students.

A popular history of the Roman Empire, from 29 B.C. to 476 A.D., was prepared by H. Stuart-Jones. Four volumes of the English translation (six of the French translation) of Ferrero's *Greatness and Decline of Rome* have now been published; these carry the history from the death of Sulla through 22 B.C. Very various estimates of Ferrero's work have been expressed by reviewers. Some have declared that it supersedes that of Mommsen himself. On the whole, however, the first glamour of his work seems to be passing; it is felt by some at least that he carries altogether too far his application of his economic theories, based on a study of modern life, to the facts of Roman history, seeing analogies to modern things, movements and tendencies where in reality no such analogies are discoverable at all by one not obsessed by a predetermined theory. "Perhaps his book will stimulate interest, rather than advance, knowledge." A second volume of Mommsen's collected historical papers has appeared.

In the domain of grammar, we may note first a paper by Professors Oertel and Morris, *The Nature and Origin of Indo-European Inflection*, printed in *Harvard Studies*, volume 16; the authors protest against the method involved in the search for fundamental meanings of inflections, whether of nouns or of verbs, holding that originally inflections had only vague meanings or none at all; subjunctive and optative at the start were practically synonymous, and were only gradually adapted to express the meanings which we associate with them in the developed languages. Mention may be made also of Tenney Frank's *Semantics of Modal Construction*, in *Classical Philology*, volumes 2 and 3, of C. Mutzbauer's *Die Grundbedeutung des Konjunktiv und Optativ und ihre Entwicklung im Griechischen*, a valuable collection and analysis

of all the Homeric examples of the subjunctive and optative, of H. Richards's *Xenophon and Others*, which deals with various points of Greek syntax, of the revised edition of F. E. Thompson's *A Syntax of Attic Greek*, of Grandgent's *Introduction to Vulgar Latin*, which is of value to the Latinist in various ways, of the *Supplement-Band* to the *Historische Grammatik der Lateinischen Syntax*, by C. F. W. Müller, an elaborate discussion (165 large pages) of the *Syntax des Nominativs und Akkusativs im Lateinischen*, and of B. L. Gildersleeve's articles on *Stahl's Syntax of the Greek Verb*, in *The American Journal of Philology*, an elaborate review of J. M. Stahl's *Kritisch-Historische Syntax des Griechischen Verbums der Klassischen Zeit*, published in 1907.

The year saw the completion of the seventh edition of Krebs's *Antibarbarus der Lateinischen Sprache*, revised by J. H. Schmalz. Lodge's *Lexicon Plautinum* was advanced by the publication of part 5, pages 385-480, which carries the work into *ego*. Parts 11 and 12 of Olcott's *A Dictionary of the Latin Inscriptions*, carrying the work through *amo*, also appeared. In *Harvard Studies*, volume 19, W. H. P. Hatch studies certain Greek words.

In the field of metre and prosody special mention must be made of an article in the *Transactions of the American Philological Association* for 1907, by Professor Paul Shorey, entitled *The Choriambic Dimeter and the Rehabilitation of the Antispast*; it criticises the latest theories concerning Greek metres, advocated for example by Wilamowitz, and defends the school of Schmidt and Christ. In the *Cambridge Journal of Philology*, volume 30, W. R. Hardie shows that Vergil allows coincidence of verse-accent and word-accent far less often than Cicero, Catullus and Lucretius. J. W. White, in *Harvard Studies*, volume 18, discusses *Logædion Metre in Greek Comedy*; R. Radford, in *American Journal of Philology* for 1907, continued his important studies in Plautine metre.

Of books and articles relating to Greek and Latin literature we may mention first some bearing on Homer, as G. Finsler's *Homer*, the review of Homeric Study from 1881-1906 in *Bursian's Jahresbericht*, T. E. Agar's elaborate *Homericæ; Emendations and Elucidations of the Odyssey*, and T. W. Allen's text of the *Odyssey* in the Oxford Classical Texts. In the new edition of Pindar in the Teubner Texts the more important of the Oxyrhynchus fragments of Pindar (see above) are given. There were also elaborate editions of Æschylus (of the *Eumenides* by Verrall, of the *Seven Against Thebes* by Tucker). We may mention again here Macan's Herodotus, 7-9 (see above).

Other works to be named here are Burnet's *Early Greek Philosophy* (new edition), Mario V. Williams's *Six Essays on the Platonic Theory of Knowledge*, Mackail's *Virgil and Virgilianism*, in *Classical Review*, a study of the *Carmina Minora* attributed to Vergil, J. W. Beck's *Horaz-Studien*, H. Richards's *Xenophon and Others*, L. Laurand's *De Ciceronis Studiis Rhetoricis* and *Études sur le Style des Discours de Cicéron*, J. W. Clark's *Bibliography of Bentley*, A. Guthkelch's *The Battle of the Books*, by Jonathan Swift; with *Selections from the Literature of the Phalaris Controversy*, E. G. Sihler's *Testimonium Animæ*, essays dealing with the

spiritual elements in classical civilization, the second edition of Heinze's *Virgils Epische Technik*, Cichorius's *Untersuchungen zu Lucilius*, reviewed in part by C. Knapp, in *American Journal of Philology*, the second volume of Vahlen's collected writings (under the title *Opuscula Academica*), the first part of the fifth edition of Christ's *Geschichte der Griechischen Literatur*, G. Friedrich's elaborate edition of Catullus, the third and last volume of Wessner's edition of Donatus's commentary on Terence, and Van Leeuwen's *Prolegomena to Aristophanes*.

Zielinski's *Cicero im Wandel der Jahrhunderte* appeared in a new edition, greatly enlarged, J. W. Sandys's *History of Classical Scholarship* was completed by the publication of volumes 2 and 3; of these the second begins with Petrarch and ends with the close of the eighteenth century in Italy, France, England and the Netherlands, the third comprises the eighteenth century in Germany and the nineteenth century in Germany, the rest of Europe and the United States. Mention should be made here of Gudeman's *Grundriss der Geschichte der Klassischen Philologie*, which is an enlarged version of his *Outlines of the History of Classical Philology*, which had already passed through several editions.

Much activity was shown in the course of the year in the publication of translations of important Greek and Latin texts. We have space to mention only translations of the *Eumenides* and the *Prometheus* of Æschylus, by Headlam; of certain plays of Æschylus by A. S. Way, the translator of Euripides; of the *Frogs* of Aristophanes and the *Bacchæ* of Euripides, by Gilbert Murray; of Hesiod, by A. W. Mairs, and of Statius's *Silvæ*, by T. A. Slater. Frère's translations of the *Acharnians*, *Knights*, *Birds*, *Frogs* and *Peace* of Aristophanes have been reissued in a single volume. Aristotle's *De Anima* has been rendered and expounded by R. D. Hicks. Two more translations of Vergil have appeared, by J. Jackson and T. H. Williams. A good translation of Tacitus's *Minor Works*, by Fyfe, and the first two installments of a series of translations of Aristotle's works, by Messrs. Beare, Ross and Joachim, have also appeared. Calverley's translations of the *Idylls* of Theocritus and the *Eclogues* of Vergil have been reprinted in one volume; Seneca's tragedies were translated by F. J. Miller (Chicago University Press).

PHILOLOGY, MODERN. In this branch of linguistic science the year 1908 was marked by orderly progress along the lines already laid down, rather than by any noteworthy discoveries. The progress made may, therefore, be indicated by a list of the chief works upon the subject, including a few books which appeared in 1907, but too late in that year to be recorded in the last YEAR BOOK.

In the field of Germanic philology the most important work appeared in the closing days of the year—A. Torp and H. Falk's *Wortschatz der germanischen Spracheinheit* (Göttingen, 1909; the third part of the long-awaited second edition of the *Vergleichendes Wörterbuch der indogermanischen Sprachen* of A. Fick). This is practically the only publication of the period under discussion which deals with more than an individual language or dialect, and of it account must be taken for some years to come. In Gothic W. Streitberg has published the first

volume of a new edition of *Ulfilas* (Heidelberg, 1908; containing the Gothic and Greek texts, introduction, various readings, and a discussion of sources); and S. Feist issued the first part (*A-M*) of his *Etymologisches Wörterbuch der gotischen Sprache* (Halle, 1909; including the so-called "Crim Gothic"). The sole noteworthy addition to our knowledge of Old High German is J. Schatz's *Altbairische Grammatik* (Göttingen, 1907). In Modern German the first of the twelve parts of the fifth edition of F. L. K. Wiegand's *Deutsches Wörterbuch*, edited by K. v. Bahder, H. Hirt, and K. Kant, appeared (Giessen, 1907); and more special problems are discussed in H. Stöckel's *Deutsche Sprachlehre auf geschichtlicher Grundlage* (Bamberg, 1908) and W. Holzgraeffe's *Grammatisches Geschlecht der Fremdwörter und fremden Wörter im heutigen Sprachgebrauch* (Hamburg, 1908). German dialects have received generous attention in A. Gebhardt's *Grammatik der Nürnberger Mundart* (Leipzig, 1907), and F. Schwagmeyer's *Lautstand der Ravensbergischen Mundart von Hiddenhausen* (Berlin, 1908); while in dialect dictionaries K. Müller-Fraureuth issued the first part (*A-placken*) of his *Wörterbuch der obersächsischen und erzgebirgischen Mundarten* (Dresden, 1908); and the committee of the Verein für siebenbürgische Landeskunde published, under the editorship of A. Schullerus, the first part (*A-Ameise*) of a *Siebenbürgisch-sächsisches Wörterbuch* (Strassburg, 1908). Turning to the Scandinavian languages, mention should be made of H. Hermansson's *Bibliography of the Icelandic Sagas and Minor Tales* (Ithaca, 1908); and of G. Cederschiöld's smaller edition of the Icelandic *Clári Saga* (Halle, 1907; an abridgment of his critical edition of 1879). H. Falk and A. Torp have again collaborated in a *Norwegisch-dänisches etymologisches Wörterbuch*, of which the first part has appeared (Heidelberg, 1908); while J. Jakobsen has published the first part (*A-gopn*) of a similar work for the interesting dialect of the Shetland Islands, a mixture of Norse and Norman—*Etymologisk ordbog over der norrne sprog på Shetland* (Copenhagen, 1908). In the Dutch group the most noteworthy book is W. L. Van Helten's *Zur Lexicologie des Altostfriesischen* (Amsterdam, 1907).

For the study of the older period of English, J. and E. M. Wright have issued an *Old English Grammar* (London, 1908); J. W. Bright and R. L. Ramsay have edited *The West Saxon Psalms, being the Prose Portion of the "First Fifty," of the so-called Paris Psalter* (Boston, 1907), and H. Löhe has edited the Anglo-Saxon *Be Dômes Dæge* (Bonn, 1907). Special studies of this same period are contained in W. Schmidt's *Altenglische Dichtungen "Daniel" und "Azarias"* (Bonn, 1907), W. Klump's *Altenglische Handwerkeramen sachlich und sprachlich erläutert* (Heidelberg, 1908), and F. Rösener's *Französische Lehnwörter im Frühneuhochdeutschen* (Marburg, 1907). The sole noteworthy production on modern English is the first volume (phonology) of W. Horn's *Historische neuenglische Grammatik* (Strassburg, 1908).

Romance philology has received no comprehensive treatment during the time under consideration. In French, P. Plattner issued the fourth volume of his *Ausführliche Grammatik der französischen Sprache* (Freiburg, 1907), and

G. Körting his *Etymologisches Wörterbuch der französischen Sprache* (Paderborn, 1908). An interesting contribution to the scientific study of slang is contained in L. Sainéan's *L'Argot ancien* (1455-1850), dealing with the relations of French slang to the secret jargons of southern Europe and to modern slang (Paris, 1908). Perhaps the work of most general scope in French philology is the fourth series of A. Tobler's *Vermischte Beiträge zur französischen Grammatik* (Leipzig, 1908), while more special contributions form the themes of R. Schubert's *Probleme der historischen französischen Formenlehre* (part i., Berlin, 1907), W. Jurgensmann's *Französische Ortsadverba in pronominaler Verwendung* (Leipzig, 1907), I. Thiergen's *Lautliche und begriffliche Entwicklung der antik-mythologischen Namen in der französischen Sprache* (Pulsnitz, 1907), P. Fahrenkamp's *Syntax der substantivischen Interrogativpronomina qui, que, quoi imfranzösischen* (Göttingen, 1907), and H. Daub's *Entwicklung des französischen Infinitivausgangs (Vok. oder Konst.) stimmtonlos-er* (Keil, 1907). Old French is advanced by L. Wiese's new edition of K. Bartsch's *Chrestomathie de l'ancien français* (Leipzig, 1908), treating of the period from the eighth to the fifteenth century, and by R. L. G. Ritchie's *Recherches sur la syntaxe de la conjonction "que" dans l'ancien français* (Paris, 1907), while metrics receives attention in H. Chatelain's *Recherches sur le vers français au quinzième siècle* (Paris, 1908).

In the other Romance languages there has been a corresponding interest. Provençal is the theme of H. Herford's *Lateinische Proparoxytona im Altprovenzalischen* (Königsberg, 1907), and a contribution of distinct value is made in J. B. Cerlogne's *Dictionnaire du patois valdôtain* (Aosta, 1907). For Italian, O. Pianigiani has prepared his *Vocabolario etimologico della lingua italiana* (2 vols., Florence, 1907), and M. L. Wagner has studied the phonology of the Sardinian dialect spoken in the vicinity of Gennargentu, in his *Lautlehre der südsardischen Mundarten* (Halle, 1907). Spanish and Portuguese are each represented by one work dealing with the older period: A. Zauner's *Altspanisches Elementarbuch* (Heidelberg, 1908), and the second edition of J. L. de Vasconcellos's *Textos arcaicos* (Lisbon, 1908).

Slavic philology is represented only by G. Wiegand's *Bulgärische Grammatik* (Leipzig, 1907), and by the second volume of W. Vondrák's monumental *Vergleichende slavische Grammatik* (Göttingen, 1908). The study of Old Irish, in the Celtic group, receives a distinct gain in J. Vendryes's *Grammaire du vieil-irlandais* (Paris, 1908), while a knowledge of Middle Irish texts is advanced by the publication of V. H. Friedel and K. Meyer's *La Vision de Tondale (Tnúdgal)* (Paris, 1907), containing the French, Anglo-Norman and Irish versions, and by C. S. Boswell's translation of the Middle Irish *Fiss Adamnáin* under the title of *An Irish Precursor of Dante* (London, 1908). Outside the Indo-Germanic division of European languages Basque is studied by E. S. Dodgson in his *Leicurragan Verb* (London, 1907), treating of Jean Licarrague's Basque version of the New Testament, with special reference to the verb-forms on Matthew. And a *curiosum* of distorted linguistic imagination is presented by A.

E. Drake in his *Discoveries in Hebrew, Gaelic, Gothic, Anglo-Saxon, Latin, Basque and other Caucasian Languages* (Denver, 1908).

A word may also be added on the histories of the literatures here considered linguistically. In the second volume of his *Légendes épiques* (Paris, 1908), J. Bédier considers the cycles of Girard de Roussillon, the Conquest of Brittany by Charlemagne, Ogier of Denmark, and St. Faron of Meaux, and Raoul of Cambrai, and the literatures of Provence and Rumania are discussed respectively in E. Portal's *Letteratura provenzale: i moderni trovatori* (Milan, 1907), and in R. Lovera's *Letteratura rumena* (Milan, 1908).

PHILOSOPHICAL ASSOCIATION, AMERICAN. An association of professors of philosophy and others interested in philosophy, founded in 1902. It has as its object "the promotion of the interests of philosophy in all its branches, and more particularly the encouragement of original work among its members." The meetings of the association are held annually at the different universities, and are devoted to the reading and discussion of papers. The official annual proceedings of the association containing the address of the president and summaries of the papers and the discussions, are published in the *Philosophical Review*, and reprinted separately for distribution among the members. At the last meeting, which was held at the Johns Hopkins University in affiliation with the American Association for the Advancement of Science, the programme consisted of the presidential address by Professor Hugo Münsterberg, twenty papers, and a discussion on Realism and Idealism, in which five appointed speakers took the leading part. The officers of the association for the year 1909 are: President, Professor John Grier Hibben, of Princeton University; vice-president, Professor J. H. Tufts, of Chicago University; secretary and treasurer, Professor Frank Thilly, of Cornell University; members of the executive committee, Professors Ernest Albee, of Cornell University, Ralph Barton Perry, of Harvard University, Charles M. Bakewell, of Yale University; F. J. E. Woodbridge, of Columbia University, and the president, vice-president and secretary.

PHILOSOPHICAL SOCIETY AMERICAN. The first learned society formed on the American Continent, founded by Benjamin Franklin in 1743 "for the cultivation of useful knowledge and the advancement of liberal arts and sciences." The Society holds ordinary meetings on the first and third Fridays of each month from October to May, inclusive. It also holds each year in the month of April, a general meeting. The programme for the general meeting of 1908 included thirty-four papers by members from all parts of the United States. The papers presented to the Society are published, either in its *transactions* in quarto, or in its *proceedings* in octavo form. The Society awards two prizes, the Magellanic, a gold medal to the author of the best discovery of the most useful intervention relating to navigation, astronomy, or natural philosophy, and the Henry W. Phillips prize of \$2,000, which is awarded from time to time for the best essay in science and philosophy of jurisprudence. The officers of the society are as follows: President, William W. Keen; vice-presidents, William B. Scott, Simon Newcomb, and Albert A. Michelson; secretaries, I.

Minis Hayes, Arthur W. Goodspeed, James W. Holland, and Amos P. Brown.

PHILOSOPHY. Since the time of Kant philosophy has been deeply interested in the problems concerning the origin, nature, and limitations of knowledge. Whether following along the lines marked out by Hume or Kant or taking a middle ground, it has shown a preponderance and tendency toward some form of epistemological idealism. And though a large number of its devotees repudiated all attempts at reaching an adequate theory of the universe, those who did believe in the possibility of a metaphysics generally constructed idealistic systems upon their epistemological foundations. Modern thought, in other words, is written in an idealistic key, and, in the case of metaphysics, for the most part, in a monistic key. The supremacy of idealism, however, is now being attacked in all the leading countries, and the philosophical situation at present shows strong symptoms of reaction in favor of realism, dualism, pluralism, and pragmatism. Many articles and books are being written for and against the different tenets of idealism, and there is a wider and intenser interest in philosophical questions than has existed for a long time. The last two annual meetings of the American Philosophical Association, the one held at Cornell University in December, 1907, the other at the Johns Hopkins University, in 1908, gave considerable attention to the discussion of pragmatism, realism, and idealism. Characteristic expression has been given to the reactionary spirit in the volume of essays published in honor of Professor William James, of Harvard University, by his colleagues at Columbia University, *Essays Philosophical and Psychological*.

The writers betray an impatience with the past, a keen distrust of the older systems, and a strong desire to strike out for themselves into new fields. Perhaps the spirit of free enquiry has never been so intense in American philosophical circles as it is to-day. It is not strange, therefore, that in its eagerness to present "new truths" the new movement should offer much that is vague, indefinite, and inconsistent with its own claims. It can hardly be doubted that what usually happens will happen here; the period of excitement will be followed by a period of calm and profound study of the problems and the opposition between the two schools will become less marked as the things are seen in clearer perspective.

In France, where pragmatism found some enthusiastic support from the beginning, a number of books have recently appeared against it. *Le pragmatisme et ses diverses formes anglo-américaines*, by Marcel Hébert; *La philosophie moderne*, by Abel Rey; *Anti-pragmatisme*, by Adolph Schinz; and *Pragmatisme et modernisme*, by J. Bourdeau. Even in Germany, where the new movement had been almost entirely ignored, the views of James and Schiller are arousing lively discussion. Among the notable articles may be mentioned: "William James und der Pragmatismus," by R. Mueller-Freienfels, in the *Philosophische Wochenschrift*; "Pragmatismus," by W. Jerusalem, in the *Deutsche Literaturzeitung*; "Pragmatismus," by Th. Lorenz, in the *Deutsche Rundschau*; and "Der Pragmatismus," by Ludwig Stein, in the *Archiv für Systematische Philosophie*. At the last International Congress of Philosophy, held at Heidel-

berg in September, 1908, "no subject aroused so much interest as pragmatism," we are told; the topic having been introduced in a paper by Professor Royce on "The Nature of Truth in the Light of Recent Discussions," and a paper by Schiller, "Der rationalistische Wahrheitsbegriff."

In spite, however, of the opposition manifested against the traditional conceptions, the spirit of modern philosophy still remains essentially idealistic. A study of recent publications shows this. With the exception of Royce, American thinkers have thus far shown little inclination to construct systems, but even in the United States idealism has a large following. In Germany the influence of Kant is growing instead of declining. The Berlin Academy of Sciences is publishing a new critical edition of his works. The post-Kantian idealists are not only being carefully studied, but their views are being revived in modern form. New editions of some of Fichte's and Schelling's writings are appearing. Dr. Hermann Nohl has published *Hegel's Theologische Jugendschriften* from the manuscripts in the possession of the Royal Library at Berlin; Professor Adolph Lason has published a new edition of Hegel's *Phänomenologie des Geistes*; and Professor Bolland, of Leyden, is continuing his publication of Hegel's works in new editions with critical introductions. The Kuno Fischer *Festschrift, Die Philosophie im Beginn des zwanzigsten Jahrhunderts*, a second edition of which appeared in 1907, contains a number of able essays on Psychology, Ethics, Philosophy of Religion, Logic, Philosophy of Right, Philosophy of History, Aesthetics, Philosophy of Nature, and History of Philosophy, by Wundt, Bauch, Troeltsch, Windelband, Lask, Rickert, Groos, and Lipps, nearly all of which are written from the idealistic point of view. The second edition of the sixth volume of *Kultur der Gegenwart, Systematische Philosophie*, consisting of papers on the different mental sciences, the philosophy of nature, and metaphysics, by Dilthey, Riehl, Wundt, Ostwald, Ebbinghaus, Eucken, Paulsen, Muench and Lipps, is another evidence of the prevalence of idealistic thinking in Germany.

Mention may also be made of Ewald's *Kant's kritischer Idealismus als Grundlage der Erkenntnistheorie und Ethik*, of E. H. Schmitt's *Kritik der Philosophie vom Standpunkt der intuitiven Erkenntnis*, and of the second edition of Riehl's *Der philosophische Kriticismus*. And the appearance of the second edition of Edward Caird's masterly work, *The Critical Philosophy of Kant*, and of a book by Watson, *The Philosophy of Kant Explained*, shows that interest in the sage of Königsberg has not died out in England.

That the metaphysical craving, of which Schopenhauer speaks, has re-asserted itself in recent modern thought, and that it will be satisfied with nothing less than an idealistic system, may be seen from the essays contributed to *Systematische Philosophie*, by Wundt, Paulsen, and Eucken, and the brilliant paper of Lipps in the *Festschrift* on the philosophy of nature. Eucken, who received the Nobel prize in 1908, has been greatly influenced by Fichte; the books published by him in 1908 are *Der Sinn und Wert des Lebens* and the fourth edition of his well-known work, *Die Grundbegriffe der Gegenwart*, under the new title, *Geistige*

Strömungen der Gegenwart. An exposition of his views is presented to English readers in Gibson's *Rudolph Eucken's Philosophy of Life*. Hugo Münsterberg, of Harvard University, offers in his *Philosophie der Werte* a world-view based upon Kantian and Fichtean principles. In France the recent metaphysical books which have aroused the greatest interest and admiration are Bergson's *L'évolution créatrice*, which passed through three editions within less than a year, and Hamelin's *Essai sur les éléments principaux de la représentation*. Bergson, like Paulsen, Wundt, and Lipps, bases himself upon the facts of science, paying attention especially to the results of biology, and, like Münsterberg, teaches voluntarism. Hamelin follows Kant and Hegel in method and is rationalistic. But the two thinkers agree upon nearly all the fundamental points of philosophy in spite of their difference in methods; after all, they are both spiritualists and theists. In England, Belfort Bax, in his *The Roots of Reality* (1907), offers "suggestions for a philosophical reconstruction," opposes panlogism and absolutism, and advocates an idealistic monism. *The Metaphysics of Nature*, by Carveth Read, teaches a similar doctrine. To be noted in this connection are the translation of the works of Aristotle, published in England under the editorship of J. A. Smith and W. D. Ross, the tenth volume of the works of Descartes, published in France, and the works of Bruno published in Italy. A number of interesting books having an important bearing on the problems of metaphysics may also be mentioned here: Meyerson, *Identité et réalité*; Becher, *Philosophische Voraussetzungen der exakten Naturwissenschaften* (1907); Weinstein, *Die philosophischen Grundlagen der Wissenschaft* (1907); Rey, *La théorie de la physique chez les physiciens contemporains* (1907), and *L'énergétique et mécanisme au point de vue des conditions de la connaissance*; Manville, *Les découvertes modernes en physique*; Le Dantec, *Éléments de philosophie biologique*, which has been translated under the title, *The Nature and Origin of Life*. Of value to the philosopher are several books from the scientific camp. In the two volumes of his Gifford Lectures, *The Science and Philosophy of the Organism*, Hans Driesch continues his attack on the materialistic and mechanical interpretation of biological phenomena and espouses the cause of vitalism. Montgomery in his *Philosophical Problems in the Light of Vital Organization* (1907), opposes idealism, which he interprets in the subjective sense, and offers a realistic dualism as the solution of the world riddle. Carl Snyder has published the first volume of a work, *The World Machine, The First Phase: The Cosmic Mechanism*, of which the other volumes, *The Mechanism of Life* and *The Social Mechanism*, are to follow. The standpoint of the writer is naturalistic and positivistic: "what we call philosophy will be transformed or forgotten." Svante Arrhenius's *Das Werden der Welten* has been translated from the Swedish into German. The metaphysician will also be interested in Kellogg's *Darwinism To-Day* (1907), Poulton's *Essays on Evolution*, Paulin's *No Struggle for Existence; No Natural Selection*, and Steiner's *Die Lehre Darwin's in ihren letzten Folgen*.

Among the important works on logic and epistemology which have appeared in 1908, the following are to be noted: the second volume of

Baldwin's *Thoughts and Things*, bearing the title: *Experimental Logic or Genetic Theory of Thought*; a new edition of the third volume of Wundt's *Logik*; Gibson's *The Problem of Logic*; Jonas Cohn's *Voraussetzungen und Ziele des Erkennens*; Baumann's *Der Wissensbegriff*; Kreibitz's *Die intellektuellen Funktionen*; Nelson's *Über das sogenannte Erkenntnisproblem*; *De la méthode dans les sciences* (a series of essays by a number of French scholars); and Carus's *The Foundations of Mathematics*.

In the field of ethics a number of useful works has been added to the literature. Royce's *The Philosophy of Loyalty*, and Leclère's *La morale rationnelle dans ses relations avec la philosophie générale*, show the influence of post-Kantian idealistic philosophy. To the same school belongs Renouvier's *Science de la morale*, 2 vols., which has appeared in a new edition. Rashdall, in his *The Theory of Good and Evil*, 2 vols. (1907), offers a synthesis of Green and Sidgwick, of English idealism and English empiricism. Fouillée, the well-known French philosopher, constructs a scientific system of ethics upon his theory of *idées-forces*. There are immanent laws of experience, both individual and social, which determine human conduct, and these laws are also immanent ends or ideals of human nature. Moral altruism is based upon intellectual altruism. In an ideal moral order personality would be completely social and society completely personal.

In the *Ethics* of Dewey and Tufts we have an attempt to utilize the results of comparative and genetic ethics in the treatment of the moral problem. The first part of the book traces the development of morality from primitive group morality to self-conscious, reflective morality. The second part, written by Dewey, analyzes conduct on its inner personal side, and seeks to discover the principles underlying moral judgments and moral conduct. "The problem of morality is the foundation, out of the body of original instinctive impulses which compose the natural self, of a voluntary self in which socialized desires and affections are dominant, and in which the last and controlling principle of deliberation is the love of the objects which will make this transformation possible." The third part studies conduct as action in society, applying the principles of morality to modern political, economic, and domestic problems. (In connection with this phase of ethics mention may be made of a new book by Royce, *Race Questions, Provincialism and other American Problems*). The second volume of Westermarck's *The Origin and Development of the Moral Ideas*, which came out last year, will be of great service to students of genetic ethics. Worthy of notice here are a monograph by Sharp, *A Study of the Influence of Custom on the Moral Judgment*, and Sumner's *Folkways*. The question of moral training, which has been agitated in the different countries for many years, receives comprehensive treatment in the two volumes edited by M. E. Sadler, *Moral Training and Instruction in Schools, Report of an International Inquiry*, "a veritable thesaurus," as a reviewer says, "from which writers on this subject will draw materials for many years to come." Other books on ethics are: the translation of Nietzsche's *Beyond Good and Evil*, by Helen Zimmern; Sarlo and Calò, *Principi di scienza etica*; de Roussaux, *L'éthique*; Bayet, *L'idée du bien*; Aaars, *Gut*

und Böse (1907); De Lanessan, *La morale naturelle*; de Gaultier, *L'idéal moderne and La dépendance de la morale* (1907); Le Dantec, *Science et Conscience*; Becher, *Grundfrage der Ethik*; Spir, *Moralität and Religion*; Vecchio, *Il sentimento giuridico*; Vidari, *L'individualismo nelle dottrine morali del secolo XIX*; Bennett, *The Ethical Aspect of Evolution*; Murray, *A History of Christian Ethics*; the second edition of Jodl's *Geschichte der Ethik*. The first volume of the *Encyclopedia of Religion and Ethics*, edited by Dr. James Hastings, contains many articles on ethical subjects. The students of ethics will also be interested in: Draghicesco, *Le problème de la conscience*; Van Bruysell, *La vie sociale et ses évolutions*; Goldscheid, *Entwicklungstheorie*, *Entwicklungsökonomie*, *Menschenökonomie*; de Roberty, *Sociologie de l'action*; Simmel, *Sociologie*; Ross, *Sin and Society and Social Psychology*; McDougall, *An Introduction to Social Psychology*; Picard, *La philosophie sociale de Renouvier*; Crasset, *La responsabilité des criminels*; Sighele, *Littérature et criminalité*. Recent publications in the field of religion are: Eucken, *Hauptprobleme der Religionsphilosophie* (1907); Watson, *The Philosophical Basis of Religion*; Pigou, *The Problem of Theism and Other Essays*; Mitchell, *Talks on Religion*; Adam, *The Religious Teachers of Greece*; Prezzolini, *Il cattolismo rosso*; Ossip-Lourie, *Croyance religieuse et croyance intellectuelle*; Pratt, *The Psychology of Religious Belief* (1907); D'Allones, *Psychologie d'une religion*; Delacroix, *Études d'histoire et de psychologie du mysticisme*; Cutten, *The Psychological Standards of Christianity*; Réclus, *Les croyances populaires*.

The history of philosophy is treated in the following new books: Vorlaender, *Geschichte der Philosophie*, 2nd ed.; Hannequin, *Études d'histoire des sciences et d'histoire de la philosophie*, 2 vols.; Berthelot, *Évolutionisme et platonisme*; Richter, *Der Skepticismus in der Philosophie und seine Ueberwindung*, volume ii.; Duessen, *Allgemeine Geschichte der Philosophie*, volume iii.; *Die Nachvedische Philosophie der Inder*; 14th and 15th numbers of Gomperz, *Griechische Denker*; Adamson, *The Development of Greek Philosophy*, ed. by Sorley; new edition of Diels, *Fragmente der Vor-Sokratiker*; Burnet, *Early Greek Philosophy*, 2nd ed.; Robin, *La théorie platonicienne*; Barth, *Die Stoa*, 2nd ed.; Picavet, *Esquisse d'une histoire générale et comparée des philosophies médiévales*; translation of De Wulf, *Scholasticism Old and New*; Rousselot, *L'intellectualisme de Saint Thomas*; Neumark, *Geschichte der jüdischen Philosophie des Mittelalters*; Bauch, *Geschichte der neuern Philosophie bis Kant*; Höfding, *Lehrbuch der neuern Philosophie* (1907); Brett, *The Philosophy of Gassendi*; Jungmann, *René Descartes*; Erhard, *Die Philosophie des Spinoza*; Wenzel, *Die Weltanschauung Spinoza's* (1907); Bloch, *La philosophie de Newton*; Schmid, *F. H. Jacobi*; Dugard, *Emerson*; Th. Ziegler, *D. F. Strauss*; Haeberlin, *Spencer's Grundlagen der Philosophie*; Richert, *Schopenhauer*; Boutroux, *Science et religion dans la philosophie contemporaine*; Stein, *Philosophische Strömungen der Gegenwart*; Eisler's *Philosophisches Wörterbuch*, which has just appeared in a new edition. The September number (1908) of the *Revue de Métaphysique et de Morale* is devoted to study of contemporary philosophy outside of France, J.

Benrubi writing on Germany; J. S. Mackenzie, on England; Frank Thilly, on the United States; G. Amendola, on Italy; H. Höfding, on Scandinavia; and F. G. Calderon, on South America. The November number contains an article by E. Boutroux on contemporary philosophy in France.

PHOSPHATE DEPOSITS. See FERTILIZERS.

PHOTOTHERAPY. The use of various forms of light radiation in the treatment of disease was widely practiced during 1908, and with more definite knowledge of their value and limitations. Many methods were tried. Solar light may be simply concentrated or it may be split up and the various colors of the spectrum utilized, as e. g. the violet rays; or it may be projected through colored glasses. Radium emanations and the Röntgen rays were also extensively employed. The government mines in the northern part of Austria are the principal source of radium, although even here only minute quantities of this curious element are produced. The Vienna Academy of Science recently received from the Minister of the Interior 4.5 grains of pure radium bromide. This was looked upon as a large amount. A radium institute was assured in Vienna for the study of the chemical, physical, medical, and physiologic action of the element. Experiments were carried on in Joachimsthal, where the ore is found, and in Vienna, to ascertain whether water charged with radium emanations has any medical virtue. The ingestion of such water was found to be followed by definite improvement in rheumatic and arthritic cases. In practice the radium salt is placed in a capsule or tube, and held near, or in contact, or even imbedded in the growth designed to be influenced; the time of exposure being regulated by the dosage desired. No pain is caused and no sensation except that of physical contact is felt. Radium was used by Williams, in lupus erythematosus, lupus vulgaris, trachoma, psoriasis, acne, eczema, keloid, tuberculosis, dactylitis, vernal catarrh, chronic ulcer of the leg, warts, rodent ulcer, and epithelioma, the best results being obtained in epithelioma. The writer believed that radium radiations were more uniform in quantity and quality than the X-rays, and, therefore, safer and more efficient than the latter, which are employed in the same class of disease.

PHYSICS. The year 1908 was not remarkable in the progress of physics for events, like the discovery of the X-rays or of radioactivity, that open up a whole new and fertile field of experiment and theory, and attract a wide popular interest for a time; yet steady and gratifying progress was made in extending our knowledge of facts, and directing the growth of the theories by which the facts are best to be correlated. Naturally the most interesting advances have been made in the newer regions of the field of physics, notably those of radioactivity and the electron theory, though the latter is now found approachable in so many ways that its boundaries cannot easily be specified.

THE RELATIVITY THEORY. In theoretical physics the further development of the so-called 'relativity principle' has occupied a prominent place in the attention of physicists. Broadly stated, this principle, or rather postulate, denies that absolute motion, or even motion with respect to an ether that pervades space, is a conception

of any value or meaning; holding that the only motion of which we can become cognizant is the motion of one portion of *matter* with reference to another portion of *matter*. The theory had its origin in the fact that experimenters have long sought, but in vain, to detect some effect, on optical or electrical phenomena, arising from the fact that the earth has a rapid motion in its orbit, and so must be in rapid motion with respect to the ether, which is postulated as the medium in which light-waves and electrical fields exist, unless, indeed, the earth carries along with it at least the ether in its immediate neighborhood. The latter hypothesis seems for several reasons untenable. A 'relativity' theory begins with a postulate in full accord with the negative results of all such attempts to detect the motion of the earth through the ether, namely: If all parts of an optical, electrical, or other system are moving with the same velocity with reference to any axes of reference, the phenomena in the system are not influenced at all by this common velocity. That is, again, that only relative motions between portions of matter can have any influence on phenomena associated with them. For example, an observer on the swiftest comet, supplied with the most accurate apparatus imaginable, could not discover his motion without making use of light, gravitation, or some other influence coming from the sun or some other body outside the comet.

Relativity theories have taken several somewhat different forms, the Lorentz-Einstein form, for which Lorentz laid a basis as far back as 1894, being the best developed. As treated by Einstein, in a paper published early in 1908, summarizing the progress of the theory, it involves as an additional postulate the constancy of the velocity of light as measured in systems with any relative velocities. Abraham has shown, however, that this is not a necessary postulate for a consistent relativity theory. One of the immediate and most remarkable conclusions of the Lorentz-Einstein theory is that time itself is a relative quantity, depending on position. The difficulty of such a conception of time is certainly a weighty objection to the theory. That a body changes its dimensions, shortening in the direction of motion, as its velocity increases, was a hypothesis offered by Fitzgerald and by Lorentz several years ago to explain the negative results of motion through the ether experiments, and is also a consequence of the relativity theory. The application of the equations of the electro-magnetic field is simplified, since it follows directly from the theory that their form is not affected by any common velocity of all parts of the system under consideration; but the equations of ordinary mechanics have to be given a special form, allowing for a dependence of mass on velocity, if they are to hold for the action between bodies having relative velocities at all comparable with that of light; which indeed follows from any electronic theory of matter, because the electro-magnetic mass of any electric charge increases with the velocity, approaching infinity as the velocity nears that of light. The mass or inertia of a body depends on its content of energy, kinetic or potential: thus a hot body has a very slightly greater mass than the same body cold. Two pieces of matter cannot have a relative velocity greater than that of light; gravitational force cannot be propa-

gated with a greater speed than light, a conclusion that does not seriously conflict with the statement of Laplace to the contrary, since this theory introduces other elements than the limitation of the velocity of gravitation. Physicists do not by any means accept the relativity theory as they do for example the electro-magnetic theory of light, but it is being rapidly developed and extended in its applications. So far, it may safely be said, it has not been shown to be inconsistent within itself, nor at variance with any observed facts. Planck has shown that a relativity postulate furnishes an effective method of handling several problems in the thermo-dynamics of radiation. Minkowski has given a very general mathematical treatment of the relativity postulate.

THE ELECTRON. Of direct bearing on relativity theories is the important experimental work of Bucherer on the relation between the electro-magnetic mass of an electron and its velocity relative to the apparatus used. One of the main objections to the Lorentz-Einstein relativity theory had been that experiments of Kaufmann on this subject (See 1907 YEAR BOOK) had given results at too great variance with the demands of this theory to be overlooked. In determining the ratio of the value of the electric charge on the electron to the mass carrying it, he showed that the value of the ratio decreased as the velocity of the motion of the electron increases. Using a method of better design in some respects than Kaufmann, Bucherer got experimental results that led him to renounce definitely a relativity theory that he had himself put forward, but which fits very closely the equations for the relation between mass and velocity as given by the Lorentz-Einstein theory. For the value of the ratio of the charge to the mass of the electron at slow speeds, Bucherer's result 1.73×10^7 E. M. U. is somewhat smaller than the generally accepted value.

RADIOACTIVITY. Rutherford and Geiger have succeeded in counting the number of α particles given off by radium per gram per second. To do this they have taken advantage of the fact that if the difference of potential between two electrodes in air at reduced pressure be a little below that required to cause a spark to pass, the flight of a single α particle through the gas between the electrodes starts up ionization enough to be easily detectable, even demonstrable to an audience, by means of the current set up between the two electrodes. An electrometer connected to one of the electrodes gives a sudden deflection at the entrance of each α particle. The direct ionization caused by a single particle is not enough to detect, but it is magnified thousands of times through the ionization by collision set up in the strong field between the electrodes. By having a small hole of known size, covered only by a diaphragm so thin that the α particles can go through it, in the vessel containing the electrodes, the radium a known distance away, the air being exhausted from the space between to prevent absorption of the α rays, and counting by the electrometer jerks the number of particles coming through the hole in a time long enough to give a fair average rate, the data are at hand for determining the number of α particles given off in a second by the radioactive substance used. From the amount of radium-C that is in radioactive equilibrium with one gram of radium there are

thirty-four thousand million α particles shot off per second. From a gram of radium itself comes the same number; from a gram of radium in equilibrium with all its disintegration products come four times that number. Aside from the definite information it gives us concerning the α rays from radium, this success in making evident and measuring an effect produced by a single atomic particle is noteworthy as giving greater objectiveness to the atomic view of matter. Regener counted the number of α particles given off by polonium by counting the number of scintillations on a zinc sulphide screen, as in a Crookes spintharoscope, placed far enough away to reduce the number of scintillations occurring in the field of observation, to only one or two a second. There was much doubt that every α particle produces a scintillation. By counting the particles from radium by this method, and comparing with their number as obtained by the electrical method, Rutherford and Geiger showing that practically every α particle does produce a scintillation when it strikes the fluorescent zinc sulphide.

It had been known that the α particle has either a mass the same as that of a helium atom and a charge equal to twice the elementary charge of a univalent ion, or else a mass half that of the helium atom and a single elementary charge. The former seemed probable, as it would at once allow an easy explanation of the origin of helium from radioactive disintegration. The experiments of Rutherford and Geiger were carried further to furnish a proof of this. The total charge carried by the α particles from a gram of radium in a second, which was measured by a well known method, divided by the number of α particles, gives the charge on one α particle, which turns out to be two elementary charges, or the same as the charge on a bivalent ion, so that it appears altogether likely that the α particle is a helium atom, lacking the two electrons which it afterwards picks up to make the neutral or uncharged atom. If the instant of disintegration of an atom in a mass of radioactive matter is determined only by conditions inside the atom itself, and not at all by outside influences, the distribution in time of the α particles given off ought to follow the distribution as given by the law of probability, and such Rutherford and Geiger found to be the case. When the number of particles per minute was small they followed each other at quite irregular intervals.

Rutherford and Royds have made use of 250 milligrams of radium loaned by the Vienna Academy of Sciences to measure the volume of the radium emanation. Making use of the methods of handling extremely small quantities of gases as developed by Ramsay and Travers, they were able to isolate and purify the emanation from this amount of radium. As measured, the amount of emanation that is in radioactive equilibrium with one gram of radium is .58 to .66 c. c., though peculiar variations in the volume go on that are not yet satisfactorily explained. The volume expected from indirect calculations was .57 c. c. In addition to getting the volume of the emanation, the same physicists have measured the wave lengths of the lines of the spectrum of the emanation with precision. They remark that none of the lines are found in any of the stellar spectra.

Cameron and Ramsay announced during 1908 that the disintegration of radium emanation in the presence of water evolves the rare gas neon, whereas the disintegration of the dry emanation gives only helium. In the presence of copper they claimed that argon was generated. This apparent example of transmutation, or directing at will of a transformation to produce any one of three elements, attracted considerable attention for a while; but as to neon, later work by Rutherford proved that the neon, which is a constituent of the atmosphere, came from air dissolved in the water used.

Boltwood has published more information concerning ionium, the parent of radium. This substance is present in uranium ores, notably pitchblende, in three-fourths as large an amount, measured by its radioactivity, as radium itself, though it had not been discovered until Boltwood first announced and named it near the end of 1907, when its discovery at once received confirmation from Hahn. In its chemical nature ionium is closely allied to thorium. It emits α rays that have a range in air of 2.8 cm., and also β rays. Its rate of disintegration is not known, but it is very slow. In connection with ionium Boltwood estimates anew the period of decay to half for radium as 2,000 years. The existence of a parent of radium, intermediate between it and uranium, had been foretold by Rutherford. See 1907 YEAR BOOK.

A new member of the thorium family has been discovered by O. Hahn, who has split up the mesothorium previously discovered by him into two substances. He proposes a new nomenclature for the first few members of the thorium family so they will run as follows:—Thorium (α rays); thorium 2 (1 rayless, decays to half in $5\frac{1}{2}$ years); thorium 2 (β rays, decays to half in 6.2 hours); thorium 3 (radio-thorium, α rays, decays to half in 2 years). Hahn and Meitner have also discovered a new actinium product AcC, which emits β and γ rays, and decays to half in 5.1 minutes.

The question of whether the rate of radioactive disintegration is changed by a high temperature of the active substance was under investigation again, by Engler, who concluded that high temperature accelerated radioactive change in the case of radium, and by Schmidt, who concluded that in the case of RaC temperature, up to 1,300 C, had no effect on the rate of decay. Engler's work was with the more easily absorbable rays, Schmidt's with the X rays. The question was hardly considered definitely answered.

Eve has made measurements extending over a year, of the quantity of radium emanation per cubic meter in the atmosphere at Montreal. He has stated the amount of emanation in terms of the amount of radium required to continuously produce it, and finds that 60×10^{-13} gram of radium would be in radioactive equilibrium with the average amount of emanation in a cubic metre of the atmosphere. The maximum amount of emanation was seven times the minimum amount, as it varies greatly with weather conditions.

RÖNTGEN RAYS. Röntgen rays have come up mainly in two ways. First, as to the velocity, which Marx thought he had measured and concluded was the same as that of light (see 1907 YEAR BOOK). Pohl and Planck have shown that Marx's method involved errors; and so the

velocity of the X rays is still not experimentally determined. Secondly, as to the nature of X rays and the γ rays from radium, Bragg has been strongly supporting the view that the radiation is corpuscular, the corpuscles being electrically neutral, basing his reasoning on interpretations of the facts as to the way in which Röntgen rays are scattered in going through matter—corpuscular radiation and wave radiation would not be scattered in the same way. Barkla and others strongly opposed Bragg, upholding the ether pulse theory of the rays. W. Wien made a new estimation from an extension of Planck's theory of radiation, of the wave length, or pulse length, of X rays, and gives it as about 6.7×10^{-9} cm.

LIGHT AND RADIATION. Wood continued his valuable work on the optical properties of sodium vapor. Finding that the direction of magnetic rotation of the plane of polarization of some of the spectrum lines of sodium is opposite to that of the D lines, he suggested that the emission of the light of that wave length might be due to the motion of a positive electron. J. Becquerel also found evidence of positive electrons from examination of the spectrum lines of yttrium, one group of lines showing the Zeeman effect in the usual sense, explainable as the magnetic effect on the negative electrons in the radiating atoms, the other group showing it in an inverse sense, which may be attributed to the magnetic effect on positively charged particles in the atoms. As a step toward a better understanding of the little understood rôle of the positive electricity in an atom, such phenomena are of much interest. Wood has also shown that when polarized light is sent into sodium vapor, the fluorescent light from the vapor in a direction at right angles with the ray of incident light is in turn partly, about 30 per cent., polarized. Previous attempts to detect polarization had given negative results. Wood claims that the radial polarization of the solar coronal light is due to the fluorescence of the cloud of mixed metallic vapors under the intense radiation from the sun.

That the velocity of light in interstellar space is independent of its wave length has long been accepted without question, but Nordman attempted an exact study of the light from some of the variable stars with respect to the time of photometric maxima of different parts of the spectrum, and found that the red part of the spectrum from Algol, for example, reaches its maximum 16 minutes in advance of rays at the other end of the spectrum, with a probable error of ± 3 minutes. Assuming Algol to be 60 light years away, this would mean a difference in velocity between the waves at the two ends of the spectrum of one part in about ten million. Tikhoff, at Pulkowa, made similar observations, and confirms the results of Nordman's work. Lebedew, on the contrary, without questioning the observations criticised any such conclusion as Nordman drew, suggesting that the observed difference in phase of the red and the blue light from the variable stars in question might be explained by a lack of symmetry in the atmosphere of the satellite, which, passing in front of the star, causes the variation in its luminosity. A medium that would give the dispersion claimed by Nordman would, if acting like an ordinary gaseous medium, completely absorb all the light, so that we could not see the variable star at all,

nor even our sun, while to hold that there is such dispersion in the ether itself is too much at variance with all our electro-magnetic theories.

Buisson and Fabry have been engaged in re-measurement, by the most exact interferometre methods, of a series of 115 lines, mainly in the iron spectrum, to serve as spectroscopic standards. As the primary standard they have taken a red cadmium line, of wave length known in terms of the standard meter from Michelson's measurements, as adopted by the International Congress of Physics, and have now published accurate values for the wave lengths of these 115 lines, which come at small distances apart through the spectrum, thus furnishing spectroscopists a valuable set of standards.

MAGNETIC FIELD OF SUN SPOTS. From the standpoint of physics, as well as from that of astronomy, the discoveries of Hale, in connection with sun-spots, were among the most interesting of the year. It has long been known that there was a connection between sun-spots and magnetic storms on the earth, but the nature of the magnetic disturbance originating on the sun was not understood. Now Hale proved from evidence collected on the spot, so to speak, that there exists a strong magnetic field in the sun-spot. The cyclonic nature of the sun-spot was known, and was, in fact, completely confirmed during the year by Hale himself in a series of remarkable spectrophotographs; if, then, there happened to be an excess of negative or positive ions in the rotating gas of such a solar vortex, it would give rise to a magnetic field along the axis of the vortex. Reasoning that if such is the case, the light coming out along the axis of the spot, that is, along the magnetic lines of force, ought to show the Zeeman effect, or a doubling of its spectrum lines, with the two components circularly and oppositely polarized. Hale took photographs of the spots, using suitable apparatus, a Fresnel rhomb and a Nicol prism, for determining the polarization of the light. His photographs show clearly the doubling of a red iron line. Commenting on the noteworthy observations of Hale, Zeeman agreed that the evidence of a strong magnetic field along the axis of the sun-spot vortex was decisive, as such a field was the only known means by which a spectrum line would be doubled into such certain circularly polarized components. Zeeman computed that the field required for the observed separation, .22 Ångström unit, is about 6,000 gauss. Zeeman also discussed the density of charge, or concentration of electrons, in the rotating gas of the sunspot vortex necessary to produce a field of this magnitude, and found that it was not excessive as compared to the concentration of electrons in the cathode stream in a Wehnelt tube. Satisfactory explanations of why any such segregation of electric charges should exist in a sun-spot were not offered during the year, unless it was one suggested by Nichols, that the positive and negative ions are separated by the action of centrifugal force in the rotating mass. See article *ASTRONOMY*, section on *The Sun*.

POSITIVE RAYS. The positive rays, or streams of positive particles, in vacuum discharge tubes have been the subject of extended investigations by J. J. Thomson and W. Wein, whose conclusions are in substantial accord, though both of them find the phenomena very complicated.

Thomson finds that there are positive rays moving toward the anode, or against the electric field, in addition to the well-known canal rays from the anode moving toward the cathode. He seeks to explain this apparent anomaly by supposing that each of the particles which compose this retrograde stream, and which are certainly positively charged through part of their path, really starts from the cathode with a negative charge, which it keeps until the repulsion of the cathode has given it a high velocity. Moving with this high speed, approximately the same as that of the regular canal ray particles, of the order of a hundredth, the speed of light, it is subject to ionization by collision, which may remove not only the excess negative electron it bore to start with, but also a second one, leaving it positively charged, without any appreciable effect on its velocity since its mass is very large compared to that of an electron. The presence of some negatively charged particles of the same mass as the positive particles, about the same as that of a hydrogen atom, among these retrograde particles from the cathode, seems to confirm this view, as they may be considered particles that have not happened to lose their negative charges by collisions or that have picked up an excess electron again. Wein takes the view that even the particles in the regular anode or canal rays are not positively charged all the time, but in their flight are continually picking up or dropping electrons through collisions, for the magnetic deflection of some of the canal rays is not as great as it would be if the particles were constantly charged. Furthermore, Wein finds that the light emitting part of the canal ray stream is very little deflected by a magnetic field. This is in accord with his theory, because it is from just those particles that are suffering the most violent collisions, with ionizations and recombinations, charged perhaps now one way, then the other, so that the resultant magnetic deflections would be little, that we would expect the most radiation of light.

METROLOGY. New and very consistent determinations of the volume of a kilogramme of water at its maximum density have been carried out by Benoit at the International Bureau of Weights and Measures. The mean value of this volume is 1,000.28 cubic centimetres, whereas of late a value slightly less than 1,000 cc. had been the accepted one. At the Bureau also, refined studies of the thermal expansion of mercury between -20°C . and 100°C ., and of water between the freezing and the boiling point, have been made by Chappuis, who gives more exact equations for the expansion curves than have hitherto been available. Chappuis and Berthelot have made elaborate studies of the behavior of gas thermometers, using several different gases.

G. W. Pierce has developed a comparatively simple method for measuring the intensity of sound, depending on his discovery of a property of certain bodies, notably molybdenite. When supplied with contact electrodes, one of which makes contact with the crystal of molybdenite over a considerable area, the other only a point contact under proper pressure, the molybdenite acts as a rectifier for small electric oscillations, allowing the current to pass in one direction only. The sound to be measured falls on a telephone diaphragm, the vibration of which generates a magneto-telephone current that is measured by a galvanometer after rectification by the method just mentioned. Among other uses the apparatus has been applied by the in-

ventor to exploring auditoriums with reference to relative intensities of sound at different points.

PINCHOT, GIFFORD. An American forester, was born in Simsbury, Conn., on Aug. 21, 1865, graduated at Yale in 1889 and studied forestry in the Nancy (France) School, as well as in Germany, Switzerland, and Austria. He began on the Vanderbilt estate, at Biltmore, N. C., in 1890, the first systematic forestry work ever undertaken in the United States, and in 1896 was a member of the National Forestry Commission, appointed by the National Academy of Sciences, which set the boundaries of the first forest reserves afterward (1897) established by President Cleveland. The Division of Forestry, of the Department of Agriculture, organized under his direction in 1898 and 1908, had a complement of about 400 persons attached to the six district headquarters in the field. In 1903, as a member of the Public Lands Commission appointed by President Roosevelt, Mr. Pinchot made a careful examination of the public lands policy and submitted a valuable report on that subject, and it was at his suggestion that the Inland Waterways Commission was formed and made one of the four sections of the National Conservation Commission, of which he is the chairman. As head of the Government Forest Service he has the care of about 168,000,000 acres of national forests, and directs the work of about 2,500 men.

PISCHEL, RICHARD. A German Sanskrit scholar, died in Dec., 1908. He was born in Breslau, in 1849, was educated there and in Berlin, was professor of Sanskrit at Kiel from 1875 to 1885, and in 1902 became a member of the faculty at Berlin. He specialized in classical Sanskrit, and particularly in the Sanskrit drama, which he considered not indebted to the Greek drama. He also wrote on the Vedic period, and, collaborating with Geldner, published three volumes of *Vedische Studien* (1889-1907); on Prakrit grammar, *Hemacandra's Grammatik der Prakritsprachen* (1877-80); and, with Bühler, *Hemacandra's Deçñāmamāla* (1880). His other works include: *Kālidāsa's Cakuntalā*, the Bengali recension (1877); *Die Heimat des Puppenspiels* (1900), and *Materialien zur Kenntnis des Apabhramsa* (1902).

PITTSBURG SURVEY. See POPULATION, CONGESTION OF.

PLAGUE. The pandemic of bubonic plague in 1908 was in the fifteenth year of its spread. From the province of Yunnan, China, where it originated in 1894, the disease gradually extended to nearly every country of the earth, and in many places the most determined efforts on the part of sanitarians failed to remove it. Within six years after its recrudescence the plague had extended to every continent, and fifty-two countries were infected, the disease advancing along the routes of travel and commerce. The plague pandemics of history lasted long. That occurring in the sixth century—the Justinian plague—lasted over 50 years. The Black Death of the 14th century endured as long. The pandemic was widespread owing to facilities for travel and threatened to outlast its predecessors. The active agent in disseminating plague is now known to be the rat. Professor Koch considers the problem of plague prophylaxis as equivalent to the extermination of these rodents. The mortality records are appalling. Since 1896, India has had over five

and a half millions of deaths; during the last year there were 1,400,000 cases and 1,200,000 deaths. (See VITAL STATISTICS.) China and Japan had epidemics in many places, with a large number of deaths. In the Punjab, India, the disease made its greatest ravages. Deaths in 1907 reached 608,685, or 30.3 per 1,000, as against 19.7 per 1,000, the highest previous mortality rate in 1904. Since its first appearance in this province in 1902 plague has claimed nearly 2,000,000 victims, or 9 per cent. of the population. Dr. Haffkine, who had done valuable work in plague investigation and prophylaxis in India, had a setback in his work owing to the death of nineteen persons who contracted tetanus after inoculation with his plague serum. (See SERUM THERAPY.) This was not due to the prophylactic but to opening the bottle with infected forceps.

PLAGUE IN CALIFORNIA. Human plague was first noted in San Francisco in Mar., 1900, and lasted until Feb. 29, 1904, when the last cases were verified. In May, 1907, three years later, it again appeared, and verified cases occurred in several towns in Contra Costa County, and in Oakland, Alameda, and Berkeley. Ground squirrels were then believed to be the agents of its spread, and this was finally proved to be the case. Deplorable sanitary conditions existed in San Francisco after the earthquake, when thousands of people were living in a most unsanitary state, and rats, flies, and fleas were plentiful. Out of the hastily constructed stables as many as 75 to 100 dead rats were swept every morning. A campaign of rat extermination followed. Traps and poisons (arsenic and phosphorous being most effective) were used and over 1,000,000 rats were destroyed. About 15,000 fleas were combed from the rats and identified as follows: *Ceratophyllus fasciatus*, *Pulex cheopis*, *Pulex irritans*, *Ctenopsyllus musculi*, and *Ctenocephalus cornis*, in the proportion respectively of 68, 21, 5.57, 4.48, and .52 per cent. For full account see Eager, "The Present Pandemic of Plague"—a pamphlet issued by the Public Health and Marine Hospital Service; and article "Plague in California," *Journal of the American Medical Association*, Sept. 19, 1908, p. 1010.

PLANT PHYSIOLOGY. See BOTANY.

PLATINUM. The production of platinum in the United States from domestic ores in 1907 was 357 ounces, valued at \$10,589, as compared with 1,439 ounces, valued at \$45,189, in 1906; with 318 ounces, valued at \$5,320, in 1905. The average price per ounce in 1907 was \$29.66. The greater part of the platinum used in the United States was imported, chiefly from Russia, the market being controlled, it was said, by a syndicate of French and English speculators. In 1908 there was a marked falling off in imports into the United States, the imports for 11 months, ending November 30, amounting to 38,857 ounces in 1908, as against 68,712 ounces in 1907 for a similar period. The price varied from \$26 at the beginning of 1908 to \$22 in July of that year, with offerings of the metal

as low as \$18 and \$17. At the close of the year the quotations were \$24.00 and \$24.50.

PLAYGROUNDS. Among the many new movements for the better care and rearing of future citizens and mothers, that for city playgrounds takes its place alongside child labor legislation (see CHILD LABOR), the guardianship of juvenile delinquents (q. v.), and the establishment of juvenile courts (q. v.), as probably the most recent. The establishment of recreation centres, parks, and playgrounds in the congested parts of cities is prompted both by the desire to restore to the children of such districts their natural right to joyful play and by the desire to prevent the growth of habits and associations favorable to lives of crime.

The Second Play Congress met at New York September 8 for a five days' session. There were 400 delegates in attendance from 29 different States, two-thirds of the delegates being from outside New York City. These delegates included a very wide variety of public officials and social workers, as, playground commissioners, directors, and supervisors from the larger cities, members of school and park boards, city mayors and aldermen, school principals and teachers, business men, ministers, social settlement workers, and Y. M. C. A. delegates. The first session of this Congress, in Chicago in 1907, had directed its efforts toward welding together the various classes of persons interested in providing means of recreation for city children. Besides, it had sought to arouse enthusiasm for more playgrounds, parks, and recreation centres. The second session turned its attention primarily to ways and means. They considered the equipment, supervision, and legislation needed to make their desire effective.

A report was presented on the results of an inquiry in Chicago on the relation between juvenile delinquency and playgrounds. The study was based on data furnished by the records of the juvenile court during its first nine years. The analysis showed that apparently small parks and playgrounds had no effect in diminishing juvenile crime, whereas larger playgrounds, equipped with apparatus that appealed to boys between the ages of 10 and 16 had an undoubted effect in that direction. This is the only statistical study yet made of this relation, both juvenile courts and playgrounds being recent developments, but its indications are opposed to the growing demand in many cities in favor of numerous small playgrounds, rather than few large ones.

The secretary of the National Playground Association reported that, whereas in 1907 only 66 cities had playgrounds, 185 had them in 1908, and 118 more contemplated their immediate establishment. The extension of playgrounds during the year was estimated to have cost not less than \$12,000,000, ranging from the several millions devoted to a few large and thoroughly equipped playgrounds in Chicago, to the few hundreds at Kalamazoo, Mich. During the year Boston, Washington, and Baltimore extended the playground season, and made some provision for night play by electric light. Field houses were added in Los Angeles, Dayton, Pittsburgh, Dallas, Washington, Newark, and Philadelphia. Pittsburgh made plans for recreation centres, with field houses, calling for a total expenditure for two millions. In New York City the Metropolitan Parks and Playgrounds Association, succeeding an older organization,

maintained seven playgrounds, eleven ball fields, and a summer camp, while the city opened its playgrounds at night for the first time. In every important city in California, and in Montreal, Quebec, Toronto, Ottawa, and Hamilton, Canada, the new movement wrought some effect. There were several voluntary associations formed and numerous gifts for playgrounds were made by wealthy men and women. Probably the most striking endorsement of the playground movement was that given by Massachusetts cities. The Legislature of that State, by a 1908 enactment, authorized cities to purchase sites and establish playgrounds, provided that the question of so doing be approved by the majority of the cities' voters. Twenty-three cities held such a referendum in December, all but one, Northampton, approving the proposition. While the idea failed in Northampton by only four per cent. of the total vote, it was carried by overwhelming majorities in the larger cities of Worcester, Springfield, Fall River, Lawrence, Lowell, Lynn, Brockton, and New Bedford.

The National Playground Association, assisted by an appropriation from the Russell Sage Foundation, maintained during the year a field secretary. It has thus been able to make a systematic study of the comparative merits of plans and devices in use in various cities under a multitude of different conditions. It gave especial attention to the work of Professor Hetherington of the University of Missouri, who has organized playgrounds in 31 cities in his State as a part of university extension in physical training. See JUVENILE DELINQUENTS and JUVENILE COURTS.

PLENER, IGNATZ VON. An Austrian statesman, died on Feb. 17, 1908. He was born in Vienna, on May 21, 1810, studied law, and entered the government service. He became privy councillor in 1859, and, in 1860, minister of finance, in which capacity he revived the Bank Acts and the Ministry of Commerce. In 1865 he resigned and became minister of commerce in the Giskra Liberal-Central Cabinet, which was dissolved in 1870. He was in the lower house until 1873, and then entered the House of Lords. In 1880 he proposed a personal income tax, which he believed would improve political conditions. Von Plener was Austria's oldest statesman.

POLAR RESEARCH. The event of the year in polar exploration was the return to Denmark in Aug., 1908, of the Mylius Erichsen expedition to the northeast coast of Greenland. It completed the mapping of the largest island of the world by a detailed survey of the unknown coast between Cape Bismarck in the south, Cape Glacier on the north coast of the island, and Cape Bridgman on the north coast of the archipelago, north of Greenland. Its surveys were thus connected with those of Peary. This was the main object for which the party started for Greenland in June, 1906, and it was fully carried out, though unfortunately the work cost the lives of Dr. Mylius Erichsen and of his two comrades, Lieutenant Hagen-Hagen and the Greenlander Brönlund, who perished of cold and hunger, after completing their survey of the mainland coast, while groping their way southward in the growing darkness of the fall of 1907. The body of Brönlund was found in the following spring with the precious survey sheets in a bottle around his neck and a mes-

age saying that Erichsen and Hagen-Hagen had died in November.

Previous to this expedition the east coast above 77° N. Lat. was practically unknown, though the Duke of Orleans, on the *Belgica*, in 1905, had gone as far as 78½° N. and from his ship had seen part of the outer islands. The Danish explorers found the coast line very tortuous. The most striking geographical feature is a wide peninsula extending far eastward to 12° W. Long. so that the outlet of the great Polar Basin between Greenland and Spitzbergen is much narrower than it was supposed to be. A long stretch of the coast, which was named King Frederick VIII. Land, is a beautiful mountain country with picturesque valleys, deep fiords and steep mountains, rising, however, only about 2,000 feet and fronted by numerous small islands with wide and narrow channels between them. Traces of glaciers of the former ice periods were found everywhere on the bare land and many animal and plant fossils, testifying to a once milder climate, were brought home. The country bare of the ice cap is narrow and especially in the north, the inland ice extends to the edge of the sea. Some of the fiords stretch inland 40 to 60 miles from the coast and Denmark fiord is 80 miles deep. The edge of the inland ice cap is steep in places, and in others the ascent to it is very gradual. The glaciers are few and not very productive of icebergs, but some of the fiord mouths are choked with stranded bergs. Forty miles west of the inland ice edge the explorers found and mapped nunataks (land rising above the ice cap) on which were flowers and fox tracks. On the land near the ocean, bears were rather plentiful, musk-oxen and wolves were scarce, snow-hares were in great abundance, and there were walrus and seals in the sea and some polar cod and inferior fish in the glacial lakes and streams. Salmon were plentiful in one lake. No living Eskimos were found, but everywhere along the coast as far north as Denmark fiord their tent stones, caches for meat, ruins of winter dwellings, and implements were found and evidence that they had hunted the whale and reindeer, neither of which appear, at present, to be in that region.

On July 6, 1908, Commander R. E. Peary started from New York on his steamer, the *Roosevelt*, for the Arctic Ocean by way of the Smith Sound Channels, West Greenland. His purpose is to make another attempt to reach the North Pole by sledge from the most advantageous base he is able to secure on the coast of Grant Land. He carried supplies for about three years and his attending steamer, the *Erik*, carried coal to replenish the *Roosevelt's* bunkers at Etah, near Smith Sound. His scientific assistants are Ross C. Marvin of Cornell, George Borup of Yale University, and D. D. McMillan of Worcester, Mass. Arriving at Etah, he secured Eskimos, dogs, and walrus meat for dog food and on Aug. 17 started north for Grant Land with apparently good prospects. He was supplied with sounding apparatus for the purpose of ascertaining sea depths and the nature of the bottom on his journey north over the sea ice.

Dr. F. A. Cook left New York in the summer of 1907, ostensibly on a Greenland hunting trip, but when his vessel returned, leaving him in northwest Greenland, it was learned that his real purpose was to attempt to reach the

North Pole. It was found, when Peary reached Etah, last summer, that on Mar. 3, 1908, Dr. Cook started from Annatok with eight Eskimos, four sledges, and twelve dog teams to travel across Grinnell and Grant Lands to the Arctic Ocean, where his journey over the sea would begin. The only news from him was a letter dated two weeks after his start informing his white comrade, Mr. R. Francke, that he was on the west coast of Grinnell Land making his way north. Mr. Francke came home on the *Erik*.

A French Arctic expedition, in command of Captain Bernard, left France on the steamer *Jacques Cartier* in April for the seas around Novaya Zemlya to investigate the opportunities for fishing in Barents Sea, make oceanographical researches, and study the minerals of the Novaya Zemlya mountains, which are believed to be a continuation of the Urals and may contain rich deposits of metals. Several uncharted fiords were discovered on the west coast of Novaya Zemlya and parties were landed for work on these two islands. The expedition is expected to remain in the field two years.

The British Antarctic Expedition, under the command of Mr. E. H. Shackleton, which left England on the steamer *Nimrod* in July, 1907, for Victoria Land and King Edward VII. Land, sighted the Great Ice Barrier that extends between these land masses on Jan. 15, 1908, and endeavored to push eastward to King Edward VII. Land, where the party hoped to make its winter quarters. Access to this land, however, was barred by ice and the expedition was compelled to turn back to winter near Victoria Land. While steaming along the Great Barrier the party discovered a bit of new land rising in low, rounded hills, covered with snow and ice some ten or twelve miles north of the Barrier. Its length was estimated at about 800 feet above sea level and the region was close to where Ross marked on his chart "appearance of land." The fact that this land was not seen by the earlier *Discovery* expedition was doubtless due to the thick weather which prevailed when that vessel was in this region. On Jan. 31, Mr. Shackleton and his landing party of fifteen men went ashore at Cape Royds, under the shadow of Mount Erebus, and here winter quarters were established about twenty miles north of the *Discovery's* winter station. The landing of the motor car, ponies, dogs, and other equipment was accomplished with some difficulty. The *Nimrod* then returned to New Zealand. Shackleton's party was equipped for all kinds of scientific work, and in addition it was hoped to make one or more extensive sledge journeys to add to our knowledge of the outlines of the Antarctic continent, and if possible to reach the South Pole. Shackleton believed he could make the motor car useful on the comparatively smooth sea ice over which one of the *Discovery's* sledge parties travelled to the highest south yet attained. In Dec., 1908, the *Nimrod* left New Zealand again for Shackleton's headquarters, expecting to return with the explorers in Mar., 1909, but with food supplies sufficient for 38 men for a year if the vessel is frozen in and cannot return this season.

The French expedition to the Antarctic, under command of Dr. François Charcot, sailed from Havre on Aug. 15, 1908, on the *Pourquoi Pas* (Why Not), a vessel especially built for

the explorer. The brilliant results of Dr. Charcot's work in 1904 along the west coast of West Antarctica, south of America, made it comparatively easy for him to raise the large sum required by his second expedition and he set out with a fine staff of scientific assistants, six motor sleds, and fully equipped for two years. Late in November, he sailed from Buenos Aires for his former field, about 500 miles south of Cape Horn, and will endeavor to outline the coast of Alexander Land far south of the point he attained in 1904; also to explore the great sea to the west between Alexander and King Edward VII. Land to map the coasts that limit this sea on the south, if they exist, and if feasible, to reach the South Pole, though this is not among his main purposes.

The most striking features of the Antarctic in 1908 were the unusual number of vast tabular icebergs that drifted northward, and the rapid development of new whaleries, with South Georgia as a centre, the revival of the industry being due to the discovery of new whaling grounds by the Antarctic exploring expeditions of the past few years.

POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF. A learned society founded in 1889 to promote political and social science in the broad sense of the term. It has a membership and subscription list of 4,506, of which 124 are life members and 250 are residents of foreign countries. The organ of the Academy, *The Annals*, is a bi-monthly publication, of which Professor Emory R. Johnson, of the University of Pennsylvania, is the editor-in-chief. During 1908 the Academy issued the following volumes: January, *American Waterways*; March, *Lessons of the Financial Crisis*; May, *Control of Municipal Public Service Corporations*; July, *Federal Regulation of Industry*; September, *Tariff Revision*; November, *Regulation of the Liquor Traffic*. During the early part of 1909 the following volumes will be issued: January, *Industrial Education*; March, *Labor and Wages*; May, *Conservation of National Resources*; July, *Political Problems of South America*. The Academy holds several monthly meetings during the fall and winter of the year and an annual meeting in April. The meetings held during the year 1908 were: Jan. 31, "The Relation of Industrial Education to National Progress"; Mar. 20, "The Influence of the United States in the Republics of South America"; April 10th and 11th, twelfth annual meeting, four sessions, "The Scope and Limit of Governmental Control over Industry and Corporate Management." Among the subjects discussed at its annual meeting were the following: "The Present Business Situation," discussed by Marcus M. Marks, William Jay Schieffelin, Isador Straus, Samuel Gompers, James M. Beck, Charles P. Neill, George L. Duval, and Theodore Marburg; "The Relation of the Government and the Public to Corporate Development," discussed by Hon. Peter S. Grosscup, Hon. Herbert Knox Smith, and James B. Dill; "The Nation and the Railways," discussed by Hon. Martin A. Knapp, Robert Mather, M. E. Ingalls, and William A. Glasgow, Jr.; "Federal and State Control of Corporations," discussed by James R. Garfield, C. M. Hough, John Sharp Williams, Theodore E. Burton, James L. Sladen, Dr. Talcott Williams, and Hon. Henry M. Hoyt. At the meeting on Nov. 2, the subject discussed

was "The Work of the National Commission on Country Life." The officers of the Academy are as follows: President, L. S. Rowe, Ph. D., LL. D.; Vice-Presidents, Samuel McCune Lindsay, Ph. D., Columbia University, Robert W. de Forest, LL. D., New York, Edmond J. James, University of Pennsylvania; Secretary, Carl Kelsey, Ph. D., University of Pennsylvania; Treasurer, Stuart Wood, Ph. D., Philadelphia; Counsel, Hon. Clinton Rogers Woodruff, Philadelphia; Librarian, James T. Young, Ph. D.

POLITICAL ECONOMY. GENERAL WORKS. Among the more noteworthy publications of the year may be mentioned the following: Homer J. Davenport's *Value and Distribution*, a work that is both critical and constructive; Richard T. Ely's *Outlines of Economics*, a revised and much enlarged edition of a well-known textbook, prepared with the collaboration of Thomas S. Adams and Max O. Lorenz, of the University of Wisconsin, and Allyn A. Young, of Leland Stanford, Junior University; C. J. Bullock's *Introduction to the Study of Economics*, third edition; B. C. Mathew's *Our Irrational Distribution of Wealth*; J. Conrad's *Grundriss zum Studium der politischen Ökonomie*; 2 Theil, *Volkswirtschaftspolitik*; and the third enlarged edition of the *Handwörterbuch der Staatswissenschaften*, edited by J. Conrad. Two elementary texts of the year were A. S. Johnson's *Introductory Economics*, prepared for the New York School of Liberal Arts and Sciences for non-residents; and J. Nearing and F. D. Watson's *Economics*. A very important new quarterly appeared in April, under the title *The Economic Bulletin*, published by the American Economic Association. The *Bulletin* contains a section devoted to *Personal and Miscellaneous Notes*, a means of disseminating news of special interest to professional economists. It also reviews in each number more than twenty-five recent books, in the various fields of economic inquiry; and gives a complete and classified list of book and periodical publications and book reviews of the immediately preceding months. The entrance of this new periodical has led the *Quarterly Journal of Economics* to cease the publication of its similar bibliographies.

MONEY AND BANKING. Owing to the great current interest in monetary and banking questions, there was an unusual output in this field. The following works may be mentioned: F. A. Cleveland's *The Bank and the Treasury*, revised and enlarged; C. A. Conant's *The Principles of Banking*; being the second part, separately issued, of the *Principles of Money and Banking*; *The Currency Problem and the Present Financial Situation*, a series of addresses delivered at Columbia University; Horace White's *Money and Banking*, third revised edition; J. J. Knox's *History of Banking in the United States*; J. J. MacLaren's *Banks and Banking in Canada*; A. Del Mar's *History of Monetary Systems in Ancient and Modern Times in Rome, France and other European Countries*; D. R. Dewey's *Financial History of the United States*, third edition; *Lessons of the Financial Crisis*, a series of articles published by the American Academy of Political and Social Science; three volumes of the hearings and arguments before the Committee on Banking and Currency on the proposals to amend the national banking laws; and a bibliography prepared by A. P. C. Griffin, giving "a select list

of books relating to currency and banking, with special regard to recent conditions."

TAXATION AND FINANCE. Under this heading should be mentioned *State and Local Taxation*, containing the addresses delivered at the first conference of the National Tax Association at Columbus, Ohio, in 1907. The addresses of the second conference, held at Toronto, Canada, in October, 1908, were to be published. A second and revised edition of Max West's *Inheritance Tax* was issued, and *Principles of Taxation* by the same author was announced. Professor Seligman published *Separation of State and Local Revenues*. The first annual meeting of the Minnesota Academy of Social Science resulted in a volume of valuable papers under the title *Taxation*. H. M. Powell prepared a *Manual of Corporation Taxation in New York for State Purposes*. Several books on India appeared: B. H. Baden-Powell's *Short Account of the Land Revenues and Their Administration in British India*; M. de P. Webb's *India and the Empire*; a *Consideration of the Tariff Problem*, and R. Lethbridge's *India and Imperial Preference*. The Department of Commerce and Labor published a volume entitled *Inheritance Tax Laws*; *Digest of principal features of laws of Great Britain, France and Germany, with outline of inheritance taxation in the United States, and collection of judicial decisions relating thereto*.

TRADE AND TRANSPORTATION. In addition to the books on colonial preference mentioned in the preceding paragraph, the tariff was discussed by both English and American writers. The following books may be mentioned: *Harvard University Lectures on Protection of Home Industry*, R. E. Thompson; *Tariff Revision*, a collection of papers published by the American Academy of Political and Social Science; *Trade and Tariffs*, by J. M. Robertson; *Sixty Years of Protection in Canada*, by E. Poritt; *Rise and Decline of the Free Trade Movement* (2d ed.), by W. Cunningham. Other works on trade included *The Geography of Commerce and Industry*, by W. F. Rocheleau; *The Trade and Administration of the Chinese Empire*, by H. B. Morse; *Japan, its Commercial Development and Prospects*, by T. Masuda; and *Les États-Unis, et les marchés Européens*, by J. Favre. Out of the abundant literature on transportation may be selected the following: two English works on State ownership, *The Nationalization of Railways*, by E. Davies, and *Railways and Nationalization*, by E. A. Pratt; *How the Public Can Own and Control New Railroads*, by Public Ownership and Government Supervision, by S. Jaros; *Five Years of Railroad Regulation by the States*, by G. G. Huebner; *Rate Regulation as Affected by the Distribution of Governmental Powers in the Constitutions*, by R. P. Reader; *Federal Regulation of Industry*, by the American Academy of Political and Social Science; *No Government Guarantee of Bank Deposits and No Ownership of Railroads by the Government*; *Congressional History of Railways in the United States*, by S. H. Harvey; *Private Freight Cars and American Railways*, by L. H. D. Weld; *American Railway Transportation* (2d ed.), by E. R. Johnson; *Railway Reorganization*, by S. Daggett; *Economics of Railway Operation*, outlining the operations of each department and bringing into clear relief the underlying principles of economic operation, by M. L. Byers; *Confessions of a Railroad Signalman*, by J. O. Fagan;

Moody's and Poor's Manuals of railroads and the reports of the Interstate Commerce Commission. Historical works included: *History of Transportation in the Eastern Cotton Belt to 1860* by U. B. Phillips, and *Transportation on the Great Lakes*, by W. Thayer. The library of Congress issued a bibliography of books and periodical literature "relating to deep waterways from the Great Lakes to the Atlantic Ocean."

The periodical literature on these and other economic topics was abundant and frequently of superior excellence. For classified lists, see the *Readers' Guide to Periodical Literature*, or *The Economic Bulletin*.

POLO. The club championship of the Polo Association was not contested in 1908, as there was but one entering team. The junior championship event took place at Van Courtlandt Park on September 5. The New Haven Polo club was the winner, defeating Squadron A by 15½ goals to 4¾. In the cup contests the Meadow Brook Club made an excellent showing, defeating the Rockaway Club 10½ to 9½, 13½ to 9¾, 13 to 9¾, 11¼ to 8¾, and 16 to 5. Meadow Brook also defeated the Country Club, Westchester, by 10¼ to 6, Great Neck by 9 to 2¾, Bryn Mawr by 12 to 3½ and by 17½ to 10, and Dedham by 8 to 4½. Squadron A defeated the Meadow Brook Freebooters by 15½ to 4, and was defeated by New Haven, 5½ to 9.

POPULATION, CONGESTION OF.

NEW YORK. At the twenty-fifth anniversary meeting of the New York Charity Organization Society early in 1908, Mrs. Florence Kelly said that at the end of twenty-five years of the society's work conditions in New York were not improved; there was relatively more poverty, more dependence and a larger and denser congested area. She argued that this failure was due to the policy of trying to cure rather than to prevent congestion. This was a prevailing sentiment. Public opinion is not yet ready for a rational and utilitarian treatment of the problem. From March 9-28, an exhibit of congestion of population in New York City was held in the American Museum of Natural History. By the use of diagrams, maps, moving pictures, models of tenements, and other reductions of actual conditions, the causes and evils of congestion were made clear. The charts showed the distribution of nationalities, housing conditions, opportunities of children for play and recreation, prevalence of crime, mortality, sickness, recreation, relief, location of industries, and lines of transit, existing and proposed, for the distribution of population. It was shown that the density of population in Manhattan is 150.4 per acre, while that of Richmond and other outskirts of the city is only 1.9 per acre. Crowded streets are almost the only playgrounds. Statistics were presented to show that herding together leads to physical degeneration. Charts showed that a boy of 13 years brought up in a family accustomed to one-room quarters attained a height of 53.4 inches, while a boy brought up in four-room quarters attained to 55.8 inches. It was shown that sweated industries are more extensive than ever before, and that more people are working in their homes. The population of the world could be contained in the little State of New Jersey were it as thickly populated as eleven New York City blocks, which average 1,200 persons per acre. Charts showed that 18 per cent. of the families in the congested area occupied one room; and in the Italian quarter, 34.4 per cent. occupied only two

rooms. The average death rate for the city was shown to be 18.3 per cent., as against 24.9 in the congested region.

Among the suggestions for changing the present conditions were numerous means of developing transit facilities so as to enable the millions who find employment in the commercial and manufacturing districts of Manhattan to make their homes in other boroughs. Another suggestion was the division of the city into various sections set apart for manufacturing, wholesaling, shipping, banking, and finance, with provision for areas for dwelling houses contiguous to each section. This idea was an adaptation of the plans being worked out in some cities of Europe where special areas are reserved for factories. The erection of model suburban centres was suggested, as was also the erection by the city of model tenements on a large scale. The influence of this exhibit was felt in every city in America. Plans were made by the committee for exhibitions in all large cities in 1909.

OTHER CITIES. The wide extent of the agitation against congestion and for better housing conditions showed itself in active agitation in St. Louis, San Francisco, Brooklyn, Baltimore, Pittsburg, Detroit, and various cities in New Jersey and Indiana. In St. Louis, investigation by the Civic League was followed by the formation of the Tenement House Association, which plans to build model tenements and to seek only 2 per cent. return on its investments. In San Francisco a new and thoroughgoing tenement house law was enacted. Its enforcement, however, was distributed among the Health, Police, and Fire Departments, thus reducing the chances of its becoming effective. In Brooklyn, where conditions are nearly as bad as on Manhattan Island, an exhibit was held from April 1-19. In Baltimore a very inclusive tenement house law was enacted in June.

PITTSBURG SURVEY. Under this title a group of experts in sanitary and civic work, directed by the Publication Committee of *Charities and The Commons*, carried on an extensive investigation in the Pittsburg-Allegheny region, between September, 1907, and December, 1908. As an impartial and independent body of students these workers enlisted the coöperation of all classes of citizens. The funds for this study were supplied by the Russell Sage Foundation for the Improvement of Living Conditions. In November and December a civic exhibit was held in the Carnegie Institute, setting forth many of the results of this investigation. Owing to the rapid industrial expansion the city has a very large foreign population, among whom living conditions have been probably the worst to be found in this country. Hundreds of houses crowded with inhabitants were really unfit for human beings. A large part of such sections are held by absentee landlords, some of whom live abroad permanently. It was shown that in some sections foreigners were paying higher rents than natives for equal accommodations. Cellars are used for bedrooms. Immigrant lodging houses realize the worst conditions. Boarding houses are run by men at the abnormally low cost of \$10 per month for both board and room. As many as 30 or 40 men were found living in one apartment, the kitchen being used as a bedroom, beds being used twice daily, for night and day shifts. Under such conditions there is great lack of decency and morality. Children raised in cramped and dirty quarters are set to work

early. The savings of laborers were found to be tolerably large, but were secured at a frightful cost. Many negroes were found living in cheap quarters, mostly on alleys, amid filth, immorality, and vice. The frightful loss of life and of economic efficiency from typhoid fever was shown by various charts presented at the exhibit, as also the loss due to industrial accidents. The immediate effect of the survey was to arouse public interest to the keenest pitch; a census of tenement houses was begun, and the Pittsburg Civic Improvement Commission, headed by the president of the city Chamber of Commerce, was appointed by the Mayor.

PARIS. Dr. J. Bertillon's researches show it to be impossible to give relief to all persons now improperly housed in Paris. From a study of the nineteenth census, he classifies the population on a basis of character of lodging as follows: the proportion living in lodgings with more than two persons to a room, 14.3 per cent.; the proportion with insufficient lodgings, that is, one to two persons per room, 37.4 per cent.; proportion with sufficient lodgings, that is, one person per room, 23.4 per cent.; proportion with large or very large lodgings, 24.8 per cent. He found that one-seventh of the population lived three or more in one room, or five or more in two rooms. To give sufficient lodging to the 340,000 persons living under these conditions would, in his estimation, require \$68,000,000. By a classification on the basis of size of family and character of lodging he found that the proportion of persons insufficiently lodged increased rapidly with the size of the family. By a study of conditions in five other French cities, he secured similar results, thus showing that the problem of proper housing is not peculiar to the largest cities, and that even very ancient cities are only to-day beginning to grapple with problems of congestion in a high-minded and scientific spirit.

PORTER, BENJAMIN CURTIS. An American painter, died on April 2, 1908. He was born in Melrose, Mass., on Aug. 27, 1843. During the period between 1872 and 1881 he made various trips abroad to study painting, receiving most of his training in Paris and Venice. He was elected a member of the National Academy of Design in 1880. The most notable of his earlier works are "Henry V" and the "Princess Kate" (1868), "Portrait of a Lady with a Dog" (1876), and "Portrait of a Boy with a Dog." In recent years he had made a specialty of portraiture, maintaining studios in New York and Boston, and having as clients many prominent women of those two cities. His portraits won him gold medals at the expositions at Paris, 1900, at Buffalo, 1901, and at St. Louis, 1904.

PORTO RICO. A territorial possession of the United States, ceded by Spain under the treaty of Dec. 11, 1898. It is the easternmost of the four larger Antilles. The population, according to a census made in 1900, was 953,243, of whom 589,426 were white and 363,817 were colored. Its area is 3,435 square miles. The proportion of whites is greater than in any other of the West Indies, except Cuba, constituting 61.8 per cent.

MANUFACTURES. Outside of the establishments devoted to sugar and tobacco manufacture, there is little manufacturing in the Island. There are good facilities for manufacturing in the great water power and cheap labor available. There are several canning establish-

ments, but they are in operation only during five months when pineapples are being canned. There are manufactories of macaroni, planing mills, shoes, hats, drawn work and embroidery. Owing to the great depth of the water around the coast, Porto Rico has no fisheries. There are valuable deposits of gold, silver, nickel, copper, iron, lead, salt, and phosphate, but at the present time these have not been developed.

COMMERCE. The value of the merchandise shipped from the United States to Porto Rico during the fiscal year 1908 was \$22,360,336, as against \$25,320,465 in 1907; the amount shipped from Porto Rico to the United States was valued at \$25,885,776, chiefly tobacco and fruits, against \$22,065,245 in 1907. Of the exports from the United States, breadstuffs amounted to \$1,656,368; manufactures of cotton, \$2,815,467; fish, \$564,078; manufactures of iron and steel, \$3,452,770; meat and dairy products, \$2,391,205; rice, \$3,488,091; manufactures of wood, \$1,117,705. Of the exports from Porto Rico to the United States brown sugar amounted to \$18,690,149; molasses, \$265,998; cigars, \$3,407,747; leaf tobacco, \$1,582,559; oranges, \$630,666; all other fruits, \$528,670; manufactures of iron and steel, \$145,632; in 1907-8 234,006 tons of sugar, with a value of \$18,690,504, as compared with 204,079 tons valued at \$14,770,650 in 1907. There were exported in 1908 106,275,000 cigars, valued at \$3,414,140, compared with 129,210,000 valued at \$4,241,410 in 1907. The amount of leaf and stem tobacco exported was 8,392,286 pounds valued at \$1,996,055, compared with 3,344,639 pounds valued at \$1,232,058 in 1907. The coffee exported in 1908 amounted to 35,256,489 pounds valued at \$4,304,609, as compared with 38,756,750 pounds valued at \$4,693,004 in 1907. The total value of the fruit crop in 1908 was \$1,159,427, which was an increase of more than \$375,000 over the previous year.

AGRICULTURE. The general agricultural situation in the Island during 1908 was, on the whole, unfavorable. Although the greatest number of tons of sugar in the history of Porto Rico was exported, yet the cane crop of the Guayama district was almost a total loss. Tobacco also suffered heavily and the crop of coffee fell below that of 1907. The growth of the sugar industry has been steady since 1905. The output in 1908 was over three times that of the first year of the civil government, while the value of the crop has practically quadrupled the figures of 1900 and 1901. The great district lying between the districts of Guayama and Ponce on the south side of the Island has suffered since 1906 from a prolonged drought. The acreage devoted to the tobacco crop has greatly increased in 1908, but the total value of the exports was less than in 1907. This was caused by bad weather conditions in the months of December, January, and February, causing an estimated loss of 40 per cent. of the crop, and the unsettled financial conditions in the United States, which reduced the prices from 15 to 20 per cent. below those of former years. There was a falling off in the yield of coffee of 3,500,000 pounds in 1908. Of the 35,000,000 pounds exported, only 129,322 were shipped to the United States. This is less by about 50,000 pounds than the amount exported in 1907. The growing of fruit has received a great deal of attention in the Island and many

growers experimented during the year with pineapples as a quick crop in citrus groves. Large quantities were shipped fresh and the output of the pineapple canneries was nearly double that of 1907. The fruit industry suffers from the difficulties of transportation. The loading facilities are inadequate and the steamers are not fitted for this class of freight. Among minor crops, sea island cotton, though having suffered severely from the drought of 1907, showed an export of 223,053 pounds, more than double the amount shipped in 1906-7. Much assistance is being given to the cotton planters by the United States Agricultural Experiment Station (q. v.).

Much interest is being taken in the reforestation of the Island. Large tracts of land in many sections have been entirely denuded and are now practically worthless for grazing or crops. Legislation will be urged at the next session of the legislature to prevent the destruction of forests and for the replanting of the barren sections of the mountains.

TRANSPORTATION. The only important development in the railroads during the fiscal year 1908 was the completion of the road between Rio Piedres and Caguas, which was opened for traffic during the year. The road will eventually be operated by electricity, but at present is run by steam. An appropriation of \$10,000 was made at the last session of the legislature for the improvement of the Bayamon River, so as to make it navigable from that town to the harbor of San Juan. Work is being pushed on the Ponce-Guayamato to complete the connection between these towns. No harbor improvements were provided for or carried out by the insular government during the year. The work by the United States in dredging San Juan harbor, begun in Jan., 1908, was pushed throughout the year and very material progress was made. Large mileage was added during the year to roads and bridges, which has greatly facilitated transportation between various towns of the Island.

EDUCATION. The number of white pupils actually enrolled in all of the schools of the Island in 1907-8 was 59,785, of whom 34,932 were male, and 24,853 were females. There were 19,967 colored pupils, of whom 11,419 were males, and 8,548 females. The total number enrolled in all the schools, white and colored, was 79,752. Of these 74,114 were enrolled in the common schools and 5,638 in special schools. The average daily attendance during the year in the common schools was 54,375. The number of buildings in use for schools during the year was 799, of which 610 were rural and 189 town schools. The estimated value of all insular school buildings was \$564,825. The number of pupils enrolled in public high schools was 217. The total number of teachers was 1,331, of whom the white males numbered 578 and white females, 571; the colored males, 83, and colored females 99. The total expenditure for school purposes in 1907-8 was \$1,093,311, of which \$752,537 was expended by the insular government and \$340,774 by the local government.

There were 97 night schools in operation in the Island at the end of the fiscal year, with an enrollment of 3,639 pupils. The night schools were attended by both children and adults and the work done was for the most part very elementary. The work of education on the Island,

as a whole, shows very satisfactory results. The University of Porto Rico, which was established in 1903, includes a normal department, and a department of agriculture. Plans were prepared in 1908 for the opening of a mechanical department. The institution has been hampered by a lack of funds. In May, 1908, an allotment was made under the Morrill Act. The number of pupils enrolled in 1907-8 was 159.

FINANCE. The total insular revenue receipts for 1907-8 amounted to \$3,572,547. Of this amount \$979,990 came from customs; \$2,103,615 from internal revenue; \$283,680 from miscellaneous sources. The expenditures for the same period were \$3,511,599, of which \$2,594,004 was expended for executive purposes; \$379,140 for judicial purposes; \$292,993 for loans to municipalities; \$71,674 for loans to school boards. The Island had a cash surplus on hand at the end of the fiscal year of \$1,072,326.

CHARITIES AND CORRECTIONS. The charitable institutions of the Island include the insane asylum at San Juan, the blind asylum at Ponce, the leper colony, girls' charitable school, boys' charitable school, and hospitals in the different towns. On Jan. 21, 1908, a reform school for juvenile delinquents was established at Mayaguez. With few exceptions none of the penal institutions of the Island are provided with adequate quarters. On Jan. 30, 1908, there were 1546 prisoners in the correctional institutions.

HEALTH AND SANITATION. The death rate during the fiscal year 1908 was 22.97 per thousand against 26.17 per thousand during the fiscal year 1907. The births during the fiscal year exceeded the deaths by 10,721. The largest number of deaths was the result of pulmonary tuberculosis. These numbered 1845. Next in order was bronchitis, 1441; enteritis, 1325; gastro-enteritis, 1011; pernicious anemia, 1257; tetanus, 1188. The total number of deaths in that period was 23,980. During the first part of the year there was an epidemic of typhoid fever at Caguas. Tuberculosis prevails throughout the Island, and while it did not increase to any great extent in 1908, few steps have been taken to diminish the disease. The sanitary condition of the Island is very unsatisfactory. Local authorities and private individuals show a marked indifference to all that has to do with matters of sanitation. Impure water is one of the chief causes of some of the epidemics that prevailed, and impure milk results in a high death rate among infants.

HISTORY.

LEGISLATION. The legislative assembly at the session of 1908 enacted 94 laws, the greater number of which were merely amendments to the various codes, and extra appropriations for educational purposes and public improvements. The most important were the laws for the regulation of public service corporations, which gives wide powers of supervision to the executive council, and a law providing for the reorganization of the police service. The election law was also amended in such a way as to avoid the necessity for a new registration of all voters at every election. Provision was also made for the publication of an official gazette.

JUDICIARY. The Supreme Court of Porto Rico heard and decided during the year 169 appeals in civil cases, and 60 in criminal cases. In the district courts 2,570 civil and 1,014 criminal cases were tried. Of the criminal cases in these

courts only two were for murder in the first degree, and but eleven in the second degree. In the municipal courts 2,729 civil cases and 27,158 criminal cases were tried. These criminal cases are the minor offenses, such as breach of the peace, cruelty to animals, etc.

CHURCH CASES. Ever since the American occupation of the Island there has been a dispute between the Roman Catholic Church in Porto Rico and the insular government and the United States as to the ownership of certain property occupied by the insular and Federal authorities. These properties include several barracks occupied by the United States and a number of pieces of property in San Juan. Under the provisions of the act passed in 1904, the church brought suit against the insular government for the possession of the properties in dispute, but no action was brought against the United States. In Dec., 1906, the Supreme Court handed down a decision in favor of the Island in two of the suits and against the Island in another. All these cases were appealed to the Supreme Court of the United States where they are now pending. In April, 1908, an effort was made through the Catholic Bishop of Porto Rico to settle the case out of court, the proposition being that the church should appoint two commissioners, the insular government two, and the United States two, who should all meet in San Juan, and if possible find some basis of settlement for all matters in dispute. It was decided to accept this offer and the commission, which met in August, was appointed. Their findings will be submitted for ratification to the legislative assembly of Porto Rico, to the Congress of the United States, and to the Holy See.

INSULAR POLICE. A complete reorganization of the insular police force, to take effect at the beginning of the year 1908-9, was provided for by the legislature at the session of 1908. This law contemplates the organization of the force by municipalities rather than by military districts. On June 30, 1908, the numerical strength of the force was 700 guardsmen. During the year the police proved itself a well disciplined and efficient body, and law and order were preserved in the Island.

OTHER EVENTS. At the last session of the 60th Congress an act was passed placing the Porto Rico regiment upon a permanent basis. On Aug. 8, the 400th anniversary of the first settlement of Porto Rico by Juan Ponce de Leon was celebrated. The remains of Ponce de Leon which were in the church of San José in San Juan were transferred to the Cathedral, where the Spanish colony of Porto Rico had erected a fitting mausoleum.

In September the legislature was in deadlock with the government for two days over the question of the appointing power of the physicians to be named as members of the Anæmia Commission. The government wished the Governor to have the power of appointment, while the legislature wished this authority to be vested in the Director of Health. The House of Delegates refused to approve the three million dollar irrigation project, which was the chief motive for calling the extra session of the legislature, unless the government yielded. This the government did and the session closed. There was a long continued strike among the cigar makers in September and October which resulted in a victory for the employees. The factories agreed

to pay \$1.50 a thousand for the making of cigars, which was the point contended for by the cigar makers. A new capitol is to be built on the summit of the highest hill in San Juan, facing the South and overlooking the Bay. The contract for this was awarded on Mar. 15th to Frank E. Perkins of New York. An important decision was handed down by Judge Rodney of the Federal Court in deciding the libel suit brought against the editor of the *Heraldo Español*. Judge Rodney said that although Balbo was born in Porto Rico, his father was a Spaniard and the Spanish crown had granted him letters of naturalization after he had renounced whatever American or Porto Rican citizenship he enjoyed, still he remained a Porto Rican. The decision virtually signifies that a citizen of Porto Rico cannot expatriate himself and become a Spanish subject.

ELECTIONS. In the elections held on Nov. 3, the Unionist Party was victorious, completely routing the Republicans and carrying every district for the House of Delegates. As a result, the Republicans will not even have a minority in the House. This victory was obtained through the Unionist Party's preaching to the peasant masses, promising independence and self government. The Republican platform was the same as that of the Republican Party in the United States.

OFFICERS: Governor, Régis H. Post; Secretary, W. F. Willoughby; Attorney-General, Henry M. Hoyt, 2d; Treasurer, Sam'l D. Gromer; Auditor, George Cabot Ward; Commissioner of the Interior of Porto Rico, Lawrence H. Graham; Commissioner of Education, Edwin Grant Dexter; Director of Health, Charities and Corrections, Francisco de Pacuña; Civil Service Commission, H. C. Coles, José Lugo-Viña, Juan Guzman Benitez; Chief of the Insular Police, Wilhelm Lutz.

PORTUGAL. A kingdom of the Pyrenean peninsula. Area, including the Azores and the Madeira Islands, 35,682 square miles; population (1900), 5,423,132. Lisbon, the capital, had 356,009 inhabitants in 1900; Oporto, 167,955; Braga, 24,202; Setubal, 22,074; Funchal (Madeira), 20,884; Coimbra, 18,144.

EDUCATION. In 1905 there were 5,119 public and over 1,600 primary schools; 23 normal schools with 1,168 students; 27 State and 5 municipal lyceums, with 5,752 pupils, besides many private secondary schools; a military college, 261 students; 19 clerical seminaries, 2,167 students; 26 industrial schools, 3,685 pupils; 2 preparatory industrial schools at Lisbon and Oporto, 638 pupils; 2 commercial elementary schools in the same towns, 720 pupils; 2 higher technical schools in the same towns, 901 students; 2 polytechnic schools in the same towns, 462 students; 6 schools of medicine, 541 students; 3 schools of pharmacy, 57 students; a school of agriculture at Lisbon, 89 students; a military school, 263 students; a naval school, 61 students; a high school of letters, 95 students; schools of fine art at Lisbon and Oporto, 283 students; a conservatory of music and dramatic art at Lisbon, 596 students; and a recently founded colonial school. The University of Coimbra, with faculties of theology, law, medicine, mathematics, and philosophy, had 1,042 students in 1905.

PRODUCTION. The production of wheat in 1907 was estimated at 6,000,000 bushels; maize, 16,000,000 bushels; wine, 107,729,000 gallons,

MANUEL II., KING OF PORTUGAL
ASCENDED THE THRONE FEBRUARY 1, 1908

against 122,945,000 gallons in 1906. The wine yield of 1908 was reported large but unprofitable, due to the great falling off in the English demand for port wine. The export of pitwood from Oporto, which commenced some ten years ago, amounted in 1907 to 93,882 metric tons, valued at \$225,000. The manufacture and sale of tobacco is a government monopoly, the concession of which (for Portugal only) is sold to a company. The concession was renewed in 1907 for a period of 19 years—to 1926. The quantity of tobacco manufactured during 1907-8 was 1,954,883 kilos (1 kilo = 2.205 lbs.), valued at 8,606,762 milreis (1 milreis = \$1.08), mostly cigarettes and cigarette tobacco. For the year ending Aug. 31, 1908, the number of cotton spinning spindles was estimated at 450,000, of which over 570,000 were reported workingshort time. The cotton consumption during the year was 81,000 bales.

COMMERCE AND COMMUNICATIONS. The imports and exports in 1907 were valued at about \$79,798,000 and \$48,893,000 respectively. Imports from Great Britain amounted to about \$13,484,260, and exports to Great Britain, \$11,587,000. According to Washington returns, the imports of the United States from Portugal during the year ending June 30, 1908, amounted to \$4,967,922, and the exports of the United States to Portugal, \$3,086,072. The leading imports are wheat, codfish, sugar, textiles, iron and steel goods and machinery, and coal. The leading exports are wine, cork, fish, and copper ore. The merchant marine consisted in 1907 of 98 steamers, of 62,214 tons, and 508 sailing vessels, of 53,642 tons. The length of railway in 1908 was 1,676 miles; of State telegraphs in 1908, 5,466 miles.

FINANCE. The budget for 1908-9 estimated the revenue at 70,530,135 milreis (1 milreis = \$1.08) and the expenditure at 72,702,737 milreis. The cost of the public debt was estimated at 30,319,233 milreis, while the army estimates were 7,811,965, and the estimates for the navy and colonies 5,100,284 milreis. On June 30, 1907, the public debt consisted of 190,408,530 milreis for the external debt and 531,994,264 milreis for the internal debt. The floating debt stood on July 31, 1908, at 79,840,031 milreis.

GOVERNMENT. King Manuel II., born Nov. 16, 1889, younger son of King Carlos I., succeeded to the throne on the assassination of his father and elder brother on Feb. 1, 1908. The Cabinet at the end of 1908 consisted of F. J. Ferreira do Amaral, President of the Council and Minister of Interior; foreign affairs, Wenceslao de Lima; justice and ecclesiastical affairs, A. A. de Campos Henriques; finance, M. A. de Espregueira; war, Sebastiao Telles; marine and colonies, Aug. de Castilho; public works, commerce, and industry, J. Calvet de Magalhães.

ARMY AND NAVY. The army is recruited by conscription, but exemption may be purchased. The peace strength of the first line (i. e., standing army and first reserve) is about 33,000 officers and men; its war strength, 111,000. The strength of the second reserve is 64,000, thus raising the total war strength of the army to 175,000 men. The colonial army, mainly in Angola and Mozambique, numbers 12,700, of whom 3,400 are Europeans. The government in 1908 adopted an automatic pistol of the German Parabellum type for all officers and mounted troops. The effective navy at the beginning of 1908 consisted of 1 armored coast defense vessel, 3,200

tons; 5 protected small cruisers, 11,200 tons; 1 unprotected small cruiser, 1,110 tons; 14 gunboats, 6,876 tons; 1 destroyer, 530 tons; 4 torpedo boats, 240 tons; giving a total of 26 ships, of 23,156 tons, with crews numbering 4200.

HISTORY.

ASSASSINATION OF THE KING AND CROWN PRINCE. On Feb. 1, 1908, as King Carlos and Queen Amalia were driving from the railway station to the palace with their two sons, assassins fired several shots, killing the King and the Crown Prince. (For further details, see CARLOS I.) The crime was generally attributed to disaffection under the Franco régime. It was alleged that three days before the murder a Republican plot had been discovered to attack the police stations, and in the resulting confusion to win over the soldiers and sailors by declaring that a republic had been proclaimed. This plot being detected, it was said that a small band of Republicans planned the murder of the King and Franco, but that the latter escaped by accident, having walked through the streets instead of driving. However that may be, reports of plots were current in January, and Premier Franco's house was guarded. Discontent had been stimulated by the government's action in ordering the replacement of the elected parochial and municipal boards by administrative commissions appointed by the government, which would have control of the coming elections. The government adopted repressive measures on the very day of the murder, adding to the power of the Franco dictatorship, authorizing the Cabinet to exile any one suspected of plotting against the government, withdrawing the immunity hitherto granted to members of Parliament, and providing for the summary trial of political suspects without appeal.

THE NEW GOVERNMENT. The King's second son, Prince Manuel (b. Lisbon, Nov. 15, 1889), succeeded to the throne under the title of Manuel II. Premier Franco resigned and, pursuant to the advice of the government, left the country. His dictatorship, to which many attributed the assassination, had come about, so his supporters declared, as a result of the corruption of party government, and as the only means of reform. It was due directly to the obstructive policy of the Cortes in refusing to vote the budget, the alleged motive of their obstruction being its failure to provide for political graft as preceding budgets had done. Franco and his supporters had contended steadily that the suspension of constitutional guarantees was essential to any effective measure of reform. On the other hand, suspicion and discontent were fostered by his policy. In December, 1907, Senhor Vilhena, the newly chosen leader of the Regeneradores, had warned the government that the dictatorship must inevitably end in crime or revolution, and as time passed the dissatisfaction increased. Under the new King a coalition ministry was formed, with Admiral Ferreira do Amaral, an Independent, as Premier. Two other Independents, two Regeneradores, and two Progressists were in his Cabinet. On Feb. 5, the King issued decrees restoring the freedom of the press, repealing the decree that suspended the immunity of Deputies from prosecution, and liberating such Deputies as were under arrest. By the end of February the repressive measures of the Franco régime were all revoked. It was decided that the elections should be held on the date appointed and that the Cortes should be convoked on

April 29. The elections were the occasion of some rioting in Lisbon, where six persons were killed and 50 wounded. The Monarchist parties were completely victorious. The returns were: Regeneradores, 63; Progressists, 59; Independents, 15; Republicans, 7; Dissident Progressists, 7; Franquistas, 3; Nationalists, 1. The budget as voted by the Cortes was as follows: Estimated revenue, \$79,000,000; estimated expenditure, \$80,000,000. The Minister of Finance was attacked for advances made to the late King and to members of his court. The tariff bill doubling the duties on articles from countries which discriminated against Portugal was passed in August. A new commercial treaty with Germany was ready for ratification at the close of the year. The wine growers were expecting great improvement in the trade from its adoption. Among the measures urged were constitutional revision and electoral reform. Discussion arose from the young King's desire to restore to the treasury money drawn from it by his father. An investigation was proposed, but an opposition developed which led to the accusation that the objectors feared lest an investigation should disclose the fact that a large part of the money went to the leaders of the parties in power. On Dec. 21 the newly elected Municipal Council of Lisbon discovered that \$7,000,000 of the city's money had been misappropriated. The great political parties which had taken turns in looting the national treasury were undoubtedly implicated. The followers of Franco took advantage of the scandal to reorganize in preparation for a renewal of the struggle. On Dec. 23 a new ministry was formed by Pereira de Lima, former minister of foreign affairs.

PORTUGUESE EAST AFRICA, OR MOZAMBIQUE. A possession of Portugal on the east coast of Africa. Area, about 293,860 square miles; population, 2,300,000. The principal ports are Mozambique, 5,500 inhabitants; Chinde, 3,000; Beira, 4,500; Lorenzo Marques, 10,000. The crops include maize, sorghum, wheat, oats, barley, lucerne, bananas, pineapples, vegetables, and numerous mafura trees, which bear a seed containing a large proportion of oil. Sugar-cane grows luxuriously and yields a high percentage of sugar. Steamers of 450 tons burden can sail up the river to the northern limits of this region. Experiments in cotton culture in Gazaland, some 20 miles from Lorenzo Marques, and elsewhere, have produced satisfactory results. In the Inhambane district also cotton may be grown with success, but owing to lack of proper methods the experiments have been abandoned. The coffee of this district is in great demand, and there are also large plantations of sisal fibre and rubber. Sisal fibre plantations have also been laid out near the Nahali River and elsewhere. Large quantities of rice are grown in the Zambesi district. Cheap native labor is abundant. Owing to the destructive methods employed by the gatherers of mangrove bark, the cutting of mangrove and acacia trees on crown lands was prohibited in 1908 for a period of ten years. The export of oil seeds and nuts in 1906 amounted to 26,771,092 pounds; it has been steadily and rapidly increasing. The imports in 1906 amounted to 7,469,85 milreis; the exports, 4,684,127 milreis; the transit trade, 27,197,988 milreis (1 milreis = \$1.08). A considerable part of the trade of British South Africa (q. v.) passes through Portuguese ports. There are 279 miles of rail-

way and 2,182 miles of telegraph line. The revenue for 1907-8 was estimated at 5,475,631 milreis; the expenditure at 5,223,823. The Governor-General in 1908 was A. A. Freire d'Andrade.

POSITIVE RAYS. See PHYSICS.

POST, RÉGIS HENRI. An American colonial administrator, was appointed governor of Porto Rico in 1907, his appointment being confirmed by the Senate on Jan. 16, 1908. He was born in New York City on Jan. 28, 1870, graduated at Harvard in 1891, studied law and was admitted to the bar. He was a member of the New York Assembly in 1899 and 1900, and in 1904 was appointed secretary of the Insular government in Porto Rico, succeeding Beekman Winthrop as governor in 1907.

POSTAL SAVINGS BANKS. In his annual message of Dec., 1908, President Roosevelt renewed his recommendation for postal savings banks. The demand for postal savings banks was greatly stimulated by the money scarcity existing during the early months of the year. It was pointed out that millions of deposits withdrawn from banks and from circulation would have in large part found their way back to trade channels through postal savings banks had such existed. The fact that the government would guarantee the deposits in such banks would give depositors every confidence in their safety. However, the Committee on Federal Legislation of the American Bankers' Association, at Denver, in October, reported adversely to postal savings banks. The grounds of opposition were, first, that present savings banks are sufficient for all legitimate needs, and, secondly, that this was a sphere of activity properly left to state governments.

As against the contention of this committee that present facilities are adequate, Postmaster-General Meyer in his 1908 report showed that 98.4 per cent. of all savings banks deposits in the United States were in fourteen States, all of them northern and eastern States, except Iowa and California; this left only 1.6 per cent. for the remaining thirty-two States. Many of these latter States have no savings banks and in all of them there are sparsely settled communities that have no banks at all. He argued from this that some means of safe deposit was badly needed in a large portion of the country. He said, "It has been estimated that altogether fully half a billion dollars not today placed in any bank due to want of opportunity or lack of confidence, might be brought back into circulation through the agency of postal savings banks." Since postal savings banks are expected to find their greatest usefulness in rural and sparsely settled communities, through the more than 40,000 money order post offices in the United States, it is not believed they would compete seriously with existing savings institutions.

As evidence of the demand for postal banks the Postmaster-General stated that during the fiscal year 1908 more than \$8,100,000 worth of postal money orders had been bought payable to purchaser by persons in twelve western and southwestern States. The party platforms of the Republican, Democratic, and Independence parties advocated the establishment of postal savings banks. Those of the last two parties named included in their recommendation that the money deposited in such banks be held for

loan by the government in the communities where deposited. The Democratic platform expressly and strongly condemned a postal savings bank plan whereby the deposits from rural regions should be aggregated by the government and so redeposited as to accumulate in financial centres. This was doubtless a criticism upon a measure introduced and favorably reported in the first session of the Sixtieth Congress, but left over for final consideration at the second session, 1908-9. This bill authorizes the government through the post offices to receive money on deposit. Such deposits, guaranteed by the government, are to be redeposited in national banks in the district where the post offices receiving them are situated. The government will thus not engage in the banking business by loaning this money to private borrowers. The national banks will be required to pay not less than $2\frac{1}{4}$ per cent. interest on such deposits; the government in turn will pay the original depositors 2 per cent., keeping the one-fourth per cent. to cover the cost of operation. The amount of interest-bearing deposit is fixed in the proposed law at \$500.

The Philippine postal savings banks established under laws of 1906 and 1907 numbered 245 on June 30, 1908. There were 5,389 accounts with deposits aggregating 1,031,994 pesos (\$515,997). The deposits were slightly more than double of those of one year previous. About 44 per cent. of the deposits belonged to Filipinos and 50 per cent. to Americans. Deposits bear $3\frac{1}{2}$ per cent. interest.

The following table prepared from public reports and the *Statesman's Year Book* give statistics of postal savings banks throughout the world, exclusive of the Philippines.

(a) Approximately.

POTATOES. Unfavorable weather conditions in 1908 resulted in a comparatively low total yield. Data furnished by the Bureau of Statistics of the Department of Agriculture showed that 3,257,000 acres produced during the season a yield of 278,985,000 bushels, or 85.7 bushels per acre. The farm price per bushel, which was 70.6 cents on Dec. 1, was sufficiently high to make the crop of the year rank first in total value, the amount being \$197,039,000. In acreage the year also stood first, but in total production it has often been exceeded. The crop of 1907 amounted to 297,942,000 bushels, but its value at an average price on Dec. 1 of 61.7 cents per bushel reached only \$183,880,000. The leading potato-growing State in 1908, as in 1907, was New York, which produced 34,850,000 bushels on 425,000 acres. Ranking next were Maine with 26,100,000 bushels on 116,000 acres, Michigan with 23,400,000 bushels on 325,000 acres, Wisconsin with 20,160,000 bushels on 252,000 acres, and Pennsylvania with 19,944,000 bushels on 277,000 acres. These five States produced about 45 per cent. of the total crop on about 23 per cent. of the total area devoted to potato culture in this year. Data for 1906 with regard to the world's production show a total yield of 4,732,934,000 bushels. Of this quantity Germany produced almost one-third, or 1,577,653,000 bushels. European Russia stood next with 939,717,000 bushels, followed by Austria-Hungary with 709,237,000 and France with 372,076,000 bushels. Data for later years are not now available.

The per capita consumption of potatoes in the United States had been about $3\frac{1}{2}$ bushels for the previous 30 years. During the last few years of this period there had not always been produced enough to supply the demand and while usually there are exported about 1,000,000 bushels a year, in 1904 there were imported over 3,000,000 bushels. Every year, however, American exports are offset to some extent by imports. The fact that the supply is often short pointed to the advisability of increasing the production, and a number of the experiment stations were doing work along that line. The Connecticut station in potato-breeding investigations reported that there are characteristic differences in seedling power which are inherited by different varieties, and that the fluctuations in these characters are large and may be increased artificially by changing environmental conditions. Correlations of practical value were not ascertained. The variation in seed-boll production may be of value in originating new seedling varieties. The Illinois experiment station suggested the following as possible methods of improving the potato: Crossing desirable plants and raising many seedlings under controlled conditions; selecting the most desirable fluctuations among the plants and tubers of a variety; and selecting discontinuous variations and studying ways of causing them. It was believed that varieties of a much higher food value on account of a higher nitrogen content might be produced by selection of seedlings based on their chemical analysis.

POTTER, HENRY CODMAN. Sixth bishop of the Protestant Episcopal diocese of New York, died on July 21, 1908. He was born in Schenectady, N. Y., on May 25, 1835, the son of Bishop Alonzo Potter, of Pennsylvania, and a nephew of Bishop Horatio Potter, whom he

succeeded in the New York diocese in 1887. He studied at the Episcopal Academy in Philadelphia, and at the Theological Seminary of Virginia, at Alexandria, where he graduated in 1857; was ordered deacon in that year, and ordained priest in 1858. He was rector of Christ Church, in Greensburg, Pa., in 1857-58, of St. John's Church, Troy, N. Y., in 1859-66; assistant at Trinity Church, Boston, in 1867-68, and rector of Grace Church, New York, in 1868-83. In 1883 he was consecrated bishop coadjutor to assist his uncle, Bishop Horatio Potter. In 1863 he had declined the presidency of Kenyon College, and in 1875 he refused the office of bishop of Iowa. In 1866-83 he was secretary to the House of Bishops.

Though he did not actively identify himself with any definite ecclesiastical policy or party, Bishop Potter became known as a "broad churchman" while he was at Grace Church. Soon after he took charge of that parish he began to organize clubs for men, classes for women, day nurseries, and other features of institutional church work. His actual sympathy with a parochial system of this kind he demonstrated in many ways, and notably during the very severe summer of 1895, when he lived for several weeks in the Stanton Street Mission House, and did what he could to lessen the sufferings of the poor in the congested districts of the East Side. But the greatest single church undertaking with which he was conspicuously identified was the plan—largely of his own formulation—to build on Morning-side Heights the great Cathedral of St. John the Divine, the corner-stone of which was laid in 1892.

In a general way, it may be said that Bishop Potter made his church a definite and powerful force in the civic and social, as well as in the religious, life of the metropolis. His scathing letter addressed to Mayor Van Wyck, in 1900, calling attention to the prevalence, and apparent protection by the police, of vice in the East Side tenement district had much to do with the organization of the Committee of Fifteen, and the election of Mr. Low as mayor of New York in the ensuing campaign. He was also one of the organizers of the National Civic Federation, and was often influential in bringing about the settlement of labor disputes, though these services were frequently rendered by private correspondence, or personal communication with employers, of which the public knew nothing at the time. In this capacity he exerted himself to effect arbitration of the coal strike in 1902, a struggle in which he approved of John Mitchell's policy, and condemned the attitude of the mine owners, though he subsequently warned labor unions that they must not insist upon the union principle to the point of restricting personal liberty.

Probably the severest criticism of Bishop Potter was that aroused by his endorsement of, and participation in, the opening of the famous "Subway Tavern," at Mulberry and Bleecker Streets, New York, on August 2, 1904; but he stoutly defended the enterprise, on the ground that the saloon is "the poor man's club," and as such should be improved and made more attractive. Again, in 1906, during the trial for heresy of the Rev. Algernon S. Crapsey, of St. Andrew's Church, Rochester, N. Y., Bishop Potter publicly challenged the "consistency" and the "integrity" of the accused clergyman, to

which his counsel, Edward M. Shepard of New York, replied with a caustic arraignment of the bishop.

Bishop Potter was twice married, his second wife being Mrs. Elizabeth S., the widow of Alfred Corning Clark.

PRESBYTERIAN CHURCH IN THE UNITED STATES, often called the **SOUTHERN PRESBYTERIAN CHURCH.** A religious denomination organized as a separate body in 1861 in consequence of the withdrawal of 47 presbyteries from the jurisdiction of the General Assembly of the Presbyterian Church in the United States of America, because of political action taken by this latter body, which action these Presbyterians held it was incompetent for a spiritual court to take. In 1908, the church had 14 synods, 83 presbyteries, 1,625 ministers, 3,217 churches, 269,733 communicants, and 375 candidates for the ministry. It had reported 197,529 scholars and 23,063 teachers in 2,353 Sabbath schools. Contributions to home missions were \$276,318; to foreign missions, \$323,879; to education, \$250,903; to colored evangelization, \$20,321; to all causes, a total of \$3,507,075. Additions to membership on profession numbered 14,053. In 2,019 women's societies were enrolled 48,741 members, with contributions amounting to \$287,779. In 1,276 young people's societies were enrolled 30,952 members, contributing \$45,247. The assembly of 1908 organized a new synod, that of Oklahoma, and began the publication of *The Home Mission Herald*, as organ of its executive committee on that subject. It appointed an *ad interim* committee to draft an amendment to the form of government touching church property. It resolved to celebrate at its next meeting the quadri-centennial of the birth of John Calvin. It authorized the republication of official documents bearing on its distinctive principles. It appointed a permanent committee on evangelistic work, and also a committee to inquire into the expediency of erecting a judicial tribunal to relieve the assembly of hearing cases of appeal and complaint. Its next meeting will be in Savannah, Ga., May 20, 1909. Its stated clerk is Rev. W. A. Alexander, Clarksville, Tenn.

PRESBYTERIAN CHURCH IN THE UNITED STATES OF AMERICA. A religious denomination which dates as an organization from 1706, when the first presbytery was formed. Presbyterian congregations, however, existed many years previously, the congregation at Hempstead, N. Y., for instance, being founded in 1644. The General Synod was established in 1716, and in 1789 the first General Assembly met at Philadelphia. The denomination included in 1908, 36 synods, 279 presbyteries, 1,300,329 communicants, 10,017 churches, and 895 ministers. In the Sunday schools of the church were included 1,164,790 members. The contributions for all purposes for the year ending Mar. 31, 1908, amounted to \$22,099,820, as compared with \$21,230,429 in 1907. Of this sum, \$1,485,626 was contributed for home missions, \$1,179,260 for foreign missions, \$11,282 for education, \$174,394 for Sunday school work, \$184,407 for church direction, \$122,449 for the relief fund, \$149,739 for freedmen, \$520,314 for col-

leges, \$104,497 for temperance, \$137,925 for the purposes of the General Assembly, etc., \$16,230,716 for congregational purposes, and \$1,699,312 for miscellaneous purposes. The home missions of the church are carried on in the whole of the United States, including Alaska and Porto Rico. Mission schools are maintained among the Indians, Alaskans, Mexicans, mountaineers, and the people of Porto Rico and Cuba. The home missionaries in the field, Mar. 31, 1908, numbered 1,530, and missionary teachers, 432. The foreign missions are in the hands of the Board of Foreign Missions, which had under its direction in 1908, 28 missions, 148 stations, 1,948 missionaries, 3,129 native helpers, 510 fully organized churches, 85,487 communicants, 1,171 schools, 39,616 pupils, 95,534 pupils in Sabbath schools, 414 students for the ministry, 57 hospitals and dispensaries, with 386,564 patients treated annually. These missions are carried on throughout the world. The work among the freedmen in the South is carried on by the Board of Missions for Freedmen. The work, organized in 1865, had in 1908 381 churches and mission stations, 23,768 communicants and 20,832 Sabbath school scholars. The board aids in sustaining 240 ministers, 343 teachers. There were 13,576 scholars in its 114 day schools. The boarding schools numbered 17, including Biddle University at Charlotte, N. C., with 14 professors, all of whom are colored. The Board of Education is the organ of the General Assembly, charged with the general and efficient superintendence of the church's work in furnishing a pious, educated and efficient ministry in numbers sufficient to meet the calls of its congregations, and for other purposes of a similar nature.

The 120th General Assembly began its session in Kansas City on Dec. 21, 1908. Among the important matters transacted at the meeting were the following: The work of the American Anti-Saloon League was heartily commended; members of the church were urged to remember their individual responsibility for violation of child labor laws; a petition was presented to the United States government in favor of reforms in the Congo Free State; a resolution was adopted calling the attention of the presbyteries and churches to the desirability of having the churches in each community unite with those of other denominations for the formation of inter-church federations, with the purpose of evangelistic work, protecting the interests of the Sabbath, temperance, and Christian citizenship, and for the building up of a strong public opinion in support of civic righteousness and for kindred purposes. It was decided by the Judicial Commission that in dissolution of pastoral relations due notice of citation must be given to both pastor and congregation. The following resolutions were adopted in regard to marriage and divorce: "Resolved, That this General Assembly rejoices in the greatly awakened interest on the part of the churches and the public in the important question of divorce and remarriage, and heartily approves the efforts of the Inter-Church Conference in influencing public opinion to overcome the evils that threaten the sanctity of the marriage relation, the integrity of the family and the welfare of the State." The efforts made by the National Educational Association to secure adequate moral instruction in the public schools were ap-

proved. The terms of the proposed union with the Welsh Presbyterian Church were commended. Officers of the General Assembly for 1908 are as follows: Moderator, Rev. Baxter P. Fullerton, D.D.; Vice Moderator, Hon. Darwin R. James; Stated Clerk and Treasurer, Rev. William Henry Roberts, D.D.; Permanent Clerk, Rev. William Brown Noble, D.D. The next General Assembly will meet at Denver, May 20, 1909. See CUMBERLAND PRESBYTERIAN CHURCH.

PRESIDENTIAL CAMPAIGN. The presidential campaign of 1908 will be discussed in this article in the following sections: I. DEMOCRATIC AND REPUBLICAN NATIONAL CONVENTIONS; II. DEMOCRATIC AND REPUBLICAN PLATFORMS; III. OTHER CONVENTIONS AND PLATFORMS; IV. ISSUES OF THE CAMPAIGN; V. PROGRESS OF THE CAMPAIGN; VI. RESULT OF THE ELECTION.

DEMOCRATIC AND REPUBLICAN NATIONAL CONVENTIONS.

The Republican and Democratic conventions for the nomination of candidates for the Presidency and Vice-presidency of the United States were remarkable in that both bodies were dominated by the candidacy of a single man, of whose nomination there was at no time in the proceedings any doubt. The results of the State conventions, previous to the national convention, had assured William H. Taft an overwhelming majority of the Republican votes, and the half-hearted campaigns carried on in behalf of Governor Charles E. Hughes of New York, Philander C. Knox, of Pennsylvania, Senator Joseph B. Foraker, of Ohio, and others, had not availed to present an opposition of any strength to his nomination.

The Democratic Convention was committed to William J. Bryan even more certainly than the Republican Convention to Judge Taft. Whatever opposition had arisen to his nomination had its rise in the East, and even there it was lacking in strength and conviction. The candidacy of Governor John A. Johnson, of Minnesota, which seemed, for a month previous to the Convention, to have some strength and vitality, lost this before the convention was convened.

Another notable and significant feature of both conventions was the lack of influence shown by the delegates from New York. In the Republican Convention, a portion of the New York delegation was committed to Governor Hughes, but there was no enthusiasm for him and the part taken by this delegation in the labors of the convention was practically nil. In the Democratic Convention, the New York delegation was nominally committed to Mr. Bryan, but there was little enthusiasm for him and the delegates were practically spectators throughout the proceedings. Judge Alton B. Parker, it is true, was temporarily conspicuous from his attempt, first in vain, and finally successful, to read resolutions of respect to the memory of the late Grover Cleveland. But aside from this, the New York delegates took practically no part in the convention except voting for Mr. Bryan when votes were called for.

REPUBLICAN CONVENTION. The Republican National Convention convened at the Coliseum in Chicago on June 16. As indicated in the paragraph above, an overwhelming majority of the delegates were pledged, before the Convention assembled, to the nomination of William H. Taft. There was a certain attempt at opposition on the

part of the adherents of Governor Hughes of New York, Senator Knox of Pennsylvania, Joseph G. Cannon of Illinois, Vice-president Fairbanks of Indiana, and Senator La Follette of Wisconsin. But in spite of this apparent overwhelming sentiment for Mr. Taft, his managers were somewhat apprehensive until the contests between the rival delegations from the Southern States had been settled. A temporary roster of the convention is made up by the Republican National Committee, which is composed of one member from each State. This committee met in Chicago several times before the opening of the convention to determine the contests over seats. Two hundred and twenty-three seats were involved, and if the National Committee had been controlled by the opponents of Mr. Taft, and had been disposed to take advantage of this opportunity, an absolute Taft majority might conceivably have been prevented. The committee, however, decided the contests almost without exception in favor of Mr. Taft, and this practical unanimity and the machine-like precision with which the contests were settled won for the Committee, and especially for its chairman, Frank H. Hitchcock, the sobriquet of the "steam roller." Senator Julius C. Burrows, of Michigan, was temporary chairman of the Convention and Senator Henry Cabot Lodge, of Massachusetts, permanent chairman; Senator Albert J. Hopkins, of Illinois, was chairman of the Committee on Resolutions, and Senator Fulton, of Oregon, chairman of the Committee on Credentials.

It was obvious, after the question of credentials had been determined, that Mr. Taft's nomination was assured unless something extraordinary took place. This extraordinary happening, in the opinion of a considerable number of the delegates and of many people throughout the country, was a stampede to nominate President Roosevelt for a third term, in spite of his often repeated and emphatic assertion that he would not serve. It was, therefore, the chief effort of the Taft supporters at this stage of the Convention to keep the situation in hand and expedite business up to the time of the presenting of the candidates and the taking of the first ballot. There was threatened delay by a possible difficulty in agreeing about details of the resolutions to be adopted as the party's platform for the campaign. These platforms are usually discussed in first draft by the sub-committee on Resolutions, and afterwards by the full committee. In the case of this platform, a draft was brought to Chicago by Mr. Wade H. Ellis, Attorney-General of Ohio. It had been approved by Judge Taft, and had been submitted to President Roosevelt, who had read it with approval. The plank in this platform which caused the difficulty was the so-called "injunction plank," which had to do with the defining or limiting of the power of the Federal Courts to issue writs of injunction. The plank as it stood in the original draft of the platform was mild in form and had been declared by lawyers and judges in no way objectionable. A number of the delegates, however, objected to even a mild form of criticism of the judiciary, and hostility developed toward the adoption of this plank in the platform. The situation was further complicated by the fact that the demand for the regulation of the use of the injunction came almost wholly from the leaders of organized labor, while the Manufacturers' Association, representing the largest manufacturing industries of the country, was determined

that the platform should contain no allusion to the subject of injunctions. A compromise was finally agreed upon and accepted by the Platform Committee, the administration leaders at Washington, and the Convention itself. This plank will be found in the section *Platforms*. It may be compared with the plank originally brought before the Committee on Resolutions, which was as follows: "We declare for such amendments to the statutes of procedure in the Federal Courts, with respect to the use of the writ of injunction as will, on the one hand, prevent the summary issue of such orders without proper consideration, and on the other, will preserve undiminished the power of the courts to enforce their process, to the end that justice may be done at all times and to all parties." (See *INJUNCTIONS*.) The platform was accepted, as finally framed by the Committee on Resolutions, by all the delegates excepting the Wisconsin delegation. This delegation had come to the Convention to present the candidacy of Senator La Follette, and had prepared in advance a strong platform which went into much greater detail respecting railroad regulation, trusts, and other economic and political questions than the platform favored by the majority. Several of these proposals were voted upon separately, among others, the demand for publicity for campaign contributions, and the resolution calling for a physical valuation of all railroad properties as the basis for the fixing of just rates, and the plank calling for the direct election of the United States Senators. These proposals received votes of the delegates from other States than Wisconsin, but they lacked the necessary number for their incorporation into the national platform.

As the time approached for the nomination of the candidate for the presidency, it was apparent to all impartial observers that the fear of a stampede to President Roosevelt was ill-founded, and in spite of attempts made to start such a movement by spectators in the galleries, the Convention was at no time in any danger of being carried off its feet. Had there been foundation for such a movement, it would have been effectually quelled by the assertion of Senator Lodge in his speech as permanent chairman: "That man is no friend of Theodore Roosevelt and does not cherish his name and fame who now, from any motive, seeks to urge him as a candidate for the great office which he has finally declined. The President refused what his countrymen would gladly have given him: he says what he means and means what he says, and his party and his country will respect his wishes as they value his high character and great public service." On the first ballot William Howard Taft received 702 out of the total 990 votes; Knox, 68; Hughes, 67; Cannon, 58; Fairbanks, 40; La Follette, 25; and Foraker, 16. The nomination was immediately made unanimous.

Several candidates were put forward for the Vice-presidency. Among the most prominent were: Governor Curtis Guild, Jr., of Massachusetts, Ex-Governor Franklin Murphy, of New Jersey, and Senator Jonathan P. Dolliver, of Iowa. It was generally admitted, however, that New York could have the place if its discordant delegates could agree upon a candidate. This was especially desirable on account of the importance of the electoral votes of New York in the election. An agreement was reached between these delegates at the last moment, and Represent-

tative James Schoolcraft Sherman, for many years a member of Congress, of New York, was put forward as a candidate. Mr. Sherman received 816 votes on the first ballot. His nomination practically concluded the business of the convention, which, after passing the usual routine resolutions, adjourned.

THE DEMOCRATIC NATIONAL CONVENTION. The Democratic National Convention met at Denver on July 7th. As stated in the initial paragraph of this section, the convention, from the beginning, was dominated by the personality of William J. Bryan, to whom the delegates, except a negligible minority, were committed before the convention assembled. A significant feature was the domination of the proceedings by the delegates of the States of the Mississippi Valley. The Pacific States acted in cordial alliance with these, as did the delegates from the South, and the Southern and Western character of the gathering was conspicuous throughout the proceedings. The only opposition shown to Mr. Bryan was on the part of the delegates from Pennsylvania, the majority of whom, under the leadership of Col. J. M. Guffey, the National Committeeman, had refused to declare for Mr. Bryan in the State Convention. In the contest which took place for the seating of these delegates in the national convention, they were unceremoniously thrust out and the contesting delegates who had declared for Mr. Bryan were seated. Following the action of the convention in regard to the Pennsylvania delegates, Col. Guffey made a violent personal attack on Mr. Bryan, charging him with double dealing, party tyranny, and secret seeking of money support from corporations. This attack, however, was ignored by the convention and had no effect except to draw from Mr. Bryan a vigorous defense. The contest in the New York delegation between Patrick H. McCarren, the leader of the Brooklyn Democrats, and Charles F. Murphy, leader of Tammany Hall, resulted in the defeat of McCarren and his delegates, who were not allowed to sit in the convention.

A delay was caused by the long continued labor of the Platform Committee, which had difficulty in fixing upon the final form of several of the planks. The greatest difficulty was in the preparation of the labor plank, and Samuel Gompers, President of the American Federation of Labor, was successful in having included a drastic declaration in favor of the regulation of injunctions by federal judges. The form of this declaration will be found in the section *Platforms*. See *INJUNCTIONS*.

The temporary chairman of the convention was Theodore A. Bell of California, while the permanent chairman was H. T. Clayton of Alabama. After the routine business of the organization of the convention on the first day of its session, ex-Judge Alton B. Parker, the head of the New York delegation, demanded recognition from the chair. It had long been known that Judge

Parker had prepared resolutions of respect to the memory of the late ex-President Cleveland, and there had been much speculation as to whether he would be permitted to read them to the convention in their original form, in the light of Mr. Bryan's antagonism to Mr. Cleveland, and their differing opinions as to the policies of the Democratic party. The chairman of the convention refused to recognize Judge Parker, but recognized instead Ignatius J. Dunn, of Nebraska, who, it was known, had also prepared resolutions of respect to the memory of Mr. Cleveland more in harmony with the spirit of the convention. Judge Parker resumed his seat and the resolutions prepared by Mr. Dunn were read. A eulogy on Mr. Cleveland was pronounced by David R. Francis from Missouri, and following this, cries were raised for Parker. As these became more insistent, he was finally recognized by the chairman of the convention and, after further persuasion, he went to the platform and read the resolutions which he had prepared. They were much warmer and more eulogistic in tone than the resolutions read by Mr. Dunn. The latter resolutions, which had been seconded by Governor Haskell, of Oklahoma, were adopted unanimously by a rising vote. The speech of the temporary chairman, Theodore A. Bell, of California, was devoted largely to an attack upon the Republican platform and to an exposition of the measures to be included in the Democratic platform. Henry T. Clayton, permanent chairman, made an address of similar tenor. The Platform Committee delayed so long in preparing and bringing in its report that the nominating speeches were delivered prior to the reading of the platform. William J. Bryan, of Nebraska, was placed in nomination by Ignatius J. Dunn of that State, and his name was received with one of the most remarkable demonstrations that ever occurred in a National Convention. Delegates and on-lookers applauded vociferously for more than an hour. Gov. John A. Johnson, of Minnesota, and Judge George Gray, of Delaware, were also placed in nomination, but their names were greeted with only perfunctory applause. At the conclusion of the nominating speeches, the platform was adopted without opposition, and on July 10 at three o'clock in the morning, the first ballot was taken, giving Bryan 892½ votes, Johnson 46 and Gray 59½. The nomination of Mr. Bryan was then made unanimous. In the evening session of the same day, John W. Kern, of Indiana, was nominated for Vice-President.

DEMOCRATIC AND REPUBLICAN PLATFORMS.

The main planks of the Republican and Democratic national platforms are set forth opposite each other in order to bring out distinctly the points of difference. The Republican platform is given on the right hand column, and the Democratic on the left.

TARIFF.

We welcome the belated promise of tariff reform now offered by the Republican party in tardy recognition of the righteousness of the Democratic position on this question; but the people can not safely entrust the execution of this important work to a party which is so deeply obligated to the highly protected interests as is the Republican party. We call attention

The Republican party declares unequivocally for a revision of the tariff by a special session of Congress immediately following the inauguration of the next President and commends the steps already taken to this end in the work assigned to the appropriate committees of Congress which are now investigating the operation and effect of existing schedules. In all tariff

to the significant fact that the promised relief was postponed until after the coming election—an election to succeed in which the Republican party must have the same support from the beneficiaries of the high protective tariff as it has always heretofore received from them; and to the further fact that during years of uninterrupted power, no action whatever has been taken by the Republican Congress to correct the admittedly existing tariff iniquities.

We favor immediate revision of the tariff by the reduction of import duties. Articles entering into competition with trust-controlled products should be placed upon the free list and material reductions should be made in the tariff upon the necessities of life, especially upon articles competing with such American manufactures as are sold abroad more cheaply than at home; and graduate reductions should be made in such other schedules as may be necessary to restore the tariff to a revenue basis.

We demand the immediate repeal of the tariff on wood pulp, print paper, lumber, timber, and logs, and that these articles be placed upon the free list.

CURRENCY.

The panic of 1907, coming without any legitimate excuse, when the Republican party had for a decade been in complete control of the federal government, furnishes additional proof that it is either unwilling or incompetent to protect the interests of the general public. It has so linked the country to Wall Street that the sins of the speculators are visited upon the whole people. While refusing to rescue the wealth producers from spoliation at the hands of the stock gamblers and speculators in farm products, it has deposited treasury funds, without interest and without competition, in favorite banks. It has used an emergency for which it is largely responsible to force through Congress a bill changing the basis of bank currency and inviting market manipulation, and has failed to give to the 15,000,000 depositors of the country protection in their savings.

We believe that in so far as the needs of commerce require an emergency currency, such currency should be issued, controlled by the Federal government and loaned, on adequate security, to national and State banks. We pledge ourselves to legislation under which national banks shall be required to establish a guarantee fund for the prompt payment of the deposits of any insolvent national bank under an equitable system which shall be available to all State banking institutions wishing to use it.

POSTAL SAVINGS BANKS.

We favor a postal savings bank if the guaranteed bank cannot be secured, and that it be so constituted as to keep the deposited money in the communities where it is established. But we condemn the policy of the Republican party in proposing postal savings banks under a plan of conduct by which they will aggregate the deposits of rural communities and redeposit the same while under government charge in the banks of Wall Street, thus depleting the circulating medium of the producing regions and unjustly favoring the speculative markets.

legislation the true principle of protection is best maintained by the imposition of such duties as will equal the difference between the cost of production at home and abroad, together with a reasonable profit to American industries.

We favor the establishment of maximum and minimum rates to be administered by the President under limitations fixed in the law, the maximum to be available to meet discriminations by foreign countries against American goods entering their markets and the minimum to represent the normal measure of protection at home; the aim and purpose of the Republican policy being not only to preserve, without excessive duties, that security against foreign competition to which American manufacturers, farmers, and producers are entitled, but also to maintain the high standard of living of the wage-earners of this country, who are the most direct beneficiaries of the protective system.

Between the United States and the Philippines we believe in a free interchange of products, with such limitations as to sugar and tobacco as will afford adequate protection to domestic interests.

We approve of the emergency measures adopted by the government during the recent financial disturbances and especially commend the passage by Congress at the last session of the law designed to protect the country from a repetition of such stringency. The Republican party is committed to the development of a permanent currency system, responding to our greatest needs, and the appointment of the national monetary commission by the present Congress which will impartially investigate all proposed methods insures the early realization of this purpose. The present currency laws have fully justified their adoption, but an expanding commerce, a marvelous growth in wealth and population, multiplying the centres of distribution, increasing the demand for movement of crops in the West and South and entailing periodic changes in monetary conditions, disclose the need of a more elastic and adaptable system. Such a system must meet the requirements of agriculturists, manufacturers, merchants, and business generally; must be automatic in operation, minimizing the fluctuations in interest rates, and above all, must be in harmony with the Republican doctrine which insists that every dollar shall be based upon and as good as gold.

We favor the establishment of a postal savings bank system for the convenience of the people and the encouragement of thrift.

TRUSTS.

A private monopoly is indefensible and intolerable. We therefore, favor the vigorous reform of the criminal law against guilty trust magnates and officials, and demand the enactment of such additional legislation as may be necessary to make it impossible for a private monopoly to exist in the United States. Among the additional remedies, we specify three: First, a law preventing a duplication of directors among competing corporations; Second, a license system which will, without abridging the right of each State to create corporations, or its right to regulate as it will foreign corporations doing business within its limits, make it necessary for a manufacturing or trading corporation engaged in interstate commerce to take out a Federal license before it shall be permitted to control as much as twenty-five per cent. of the product in which it deals, the license to protect the public from watered stock and to prohibit the control of such corporation of more than fifty per cent. of the total amount of any product consumed in the United States; and, third, a law compelling such licensed corporations to sell to all purchasers in all parts of the country on the same terms, after making due allowance for the cost of transportation.

The Republican party passed the Sherman anti-trust law over Democratic opposition and enforced it after Democratic dereliction. It has been a wholesome instrument for good in the hands of wise and fearless administration. But experience has shown that its effectiveness can be strengthened and its real objects better attained by such amendments as will give to the federal government greater supervision and control over and secure greater publicity in the management of that class of corporations engaged in interstate commerce, having power and opportunity to effect monopolies.

RAILROADS.

We assert the right of Congress to exercise complete control over interstate commerce and the right of each state to exercise control over commerce within its borders.

We demand such enlargement of the powers of the Interstate Commerce Commission as may be necessary to compel railroads to perform their duties as common carriers and prevent discrimination and extortion.

We favor the efficient supervision and rate regulation of railroads engaged in interstate commerce. To this end we recommend the valuation of railroads by the Interstate Commerce Commission, such valuation to take into consideration the physical value of the property, the original cost of production, and all elements of value that will render the valuation made fair and just.

We favor such legislation as will prohibit the railroads from engaging in business which brings them into competition with their shippers; also legislation which will prevent the over-issue of stocks and bonds; also legislation which will assure such reduction in transportation rates as conditions will permit; * * *

We favor such legislation as will increase the power of the Interstate Commerce Commission, giving to it the initiative with reference to State and transportation charges put into effect by the railroad companies, and permitting the Interstate Commerce Commission, on its own initiative, to declare a rate illegal and as being more than should be charged for such service. * * *

We favor the enactment of a law giving to the Interstate Commerce Commission the power to inspect proposed railroad tariff rates or schedules before they shall take effect, and, if they be found unreasonable, to initiate an adjustment thereof.

We approve the enactment of the railroad law and the vigorous enforcement by the present administration of the statutes against rebates and discriminations, as a result of which the advantages formerly possessed by the large shipper over the small shipper have substantially disappeared; and in this connection we commend the appropriation by the present Congress to enable the Interstate Commerce Commission to thoroughly investigate and give publicity to the accounts of interstate railroads.

We believe, however, that the interstate commerce law should be further amended so as to give railroads the right to make and publish tariff agreements subject to the approval of the commission, but maintaining always the principle of competition between naturally competing lines and avoiding the common control of such lines by any means whatsoever.

We favor such national legislation and supervision as will prevent the future over-issue of stocks and bonds by interstate carriers.

INJUNCTIONS.

The courts of justice are the bulwark of our liberties, and we yield to none in our purpose to maintain their dignity. Our party has given to the bench a long line of distinguished judges, who have added to the respect and confidence in which this department must be jealously maintained. We resent the attempt of the Republican party to raise a false issue respecting the judiciary. It is an unjust reflection upon a great body of our citizens to assume that they lack respect for the courts. * * * Experience has proved the necessity of a modification of the present law relating to injunctions, and we reiterate the pledge of our national platforms of 1896 and 1904 in favor of the measure which passed the United States Senate in 1896, but which a Republican Congress has ever since refused to enact, relating to contempts in Federal Courts and providing for trial by jury in cases of indirect contempt. Questions of judicial practice have arisen especially in connection with industrial disputes. We deem that the parties to all judicial proceedings should be treated with rigid impartiality, and that injunctions should not be issued in any cases in which injunctions would not issue if no industrial dispute were involved. The expanding organization of industry makes it essential that there should be no abridgement of the right of wage earners and producers to organize for the protection of wages and the improvement of labor conditions, to the end that such labor organizations and their members should not be regarded as illegal combinations in restraint of trade. * * *

Among the planks incorporated in the Democratic platform the following dealt with subjects not treated in the Republican platform: The party pledged itself to legislation under which national banks should be required to establish a guarantee fund for the prompt payment of deposits of any insolvent national bank (see BANKS AND BANKING). Criticism was made of the increased expenditure for federal office-holders; of the "arbitrary power" of the Speaker of the House of Representatives, and the "misuse of power" by the Executive "in using the patronage of his high office to secure the nomination of one of his cabinet officers." A demand was made for the publicity of the campaign expenditures. A plank was inserted asserting the principle of "State rights," and opposing the "centralization" of government. The party pledged itself "to insist upon the just and lawful protection of our citizens at home and abroad." The exclusion of Asiatic immigrants was advocated.

The Republican platform contained, among others, the following planks dealing with subjects not included in the Democratic platform: A plank was inserted urging the importance of efforts to upbuild rural communities by the construction of roads, extension of rural free delivery, and other means. A demand was made for the preservation of the rights of the negro and for the enforcement of the Thirteenth, Fourteenth, and Fifteenth Amendments to the Constitution. The arbitration conventions concluded in consonance with the declarations of the conference on international arbitration at The Hague were endorsed, and the general principle of arbitration was cordially praised. The establishment of a national bureau of mines and

The Republican Party will uphold at all times the authority and integrity of the courts, State and Federal, and will ever insist that their powers to enforce their process and to protect life, liberty, and property shall be preserved inviolate. We believe, however, that the rules of procedure in the Federal Courts with respect to the issuance of the writ of injunction should be more accurately defined by statute, and that no injunction or temporary restraining order should be issued without notice, except where irreparable injury would result from delay, in which case a speedy hearing thereafter should be granted.

mining was advocated. The recommendation was made that the centennial anniversary of the birth of Lincoln be celebrated throughout the country.

OTHER CONVENTIONS AND PLATFORMS

INDEPENDENCE PARTY. This party, which is the successor of the Independence League, organized in 1906 by William R. Hearst, held its convention in Chicago, and on July 28 nominated Thomas L. Hisgen of Massachusetts for president, and John Temple Graves of Georgia for vice president. Following are the leading planks in the platforms adopted:

As of first importance, in order to restore the power of government to the people, to make their will supreme in the primaries, in the elections, and in the control of public officials after they have been elected, we declare for direct nominations, the initiative and referendum, and the right of recall. * * * We demand the natural remedy of direct nominations by which the people not only elect, but, what is far more important, select their representatives.

We believe in the principle of the initiative and referendum, and we particularly demand that no franchise grant go into operation until the terms and conditions have been approved by popular vote in the locality interested.

We demand for the people the right to recall public officials from the public service. The power to make officials resides in the people, and in them also should reside the power to unmake and remove from office any official who demonstrates his unfitness or betrays the public trust.

We demand severe and effective legislation against all forms of corrupt practices at elec-

FOUR CANDIDATES FOR THE PRESIDENCY IN 1908

tions and advocate prohibiting the use of any money at elections except for meetings, literature, and the necessary traveling expenses of candidates. * * * * *

We denounce the so-called labor planks of the Republican and Democratic platforms as political buncombe and contemptible claptrap unworthy of national parties claiming to be serious and sincere. * * * * *

The Independence Party condemns the arbitrary use of the writ of injunction and contempt proceedings as a violation of the fundamental American right of trial by jury.

We declare for a gradual reduction of tariff duties with just consideration for the rights of the consuming public and of established industry.

The railroads must be kept open to all upon exactly equal terms. Every form of rebate and discrimination in railroad rates is a crime against business and must be stamped out.

We demand adequate railroad facilities and advocate a bill empowering shippers in time of need to compel railroads to provide sufficient cars for freight and passenger traffic and other railroad facilities through summary appeal to the courts.

We favor the creation of an interstate commerce court, whose sole function it shall be to review speedily and enforce summarily the orders of the interstate commerce commission.

The interstate commerce commission should have the power to initiate investigation into the reasonableness of rates and practices, and no increase in rates should be put into effect until opportunity for such investigation is afforded. The interstate commerce commission should proceed at once with a physical valuation of railroads engaged in interstate commerce.

We denounce all combinations for restraint of trade and for the establishment of monopoly in all products of labor and declare that such combinations are not combinations for production but for extortion, and that activity in this direction is not industry but robbery.

In cases of infractions of the anti-trust law of the interstate commerce act, we believe in the enforcement of a prison penalty against the guilty and responsible individuals controlling the management of the offending corporations rather than a fine imposed upon stockholders.

We advocate the extension of the principle of public ownership of public utilities, including railroads and telegraphs, as rapidly as municipal, state, or national government shall demonstrate ability to conduct public utilities for the public benefit.

We favor specifically government ownership of the telegraphs, such as prevails in every other civilized country in the world, and demand as an immediate measure that the government shall purchase and operate the telegraphs in connection with the postal service.

SOCIALIST PARTY. This party held its convention in Chicago, and on May 13 nominated Eugene V. Debs of Indiana for President, and Benjamin Hanford of New York for Vice-President. The platform adopted was as follows:

1. The immediate government relief for the unemployed workers by building schools, by reforesting cut-over and waste lands, by reclamation of arid tracts and the building of canals, and by extending all other useful public

works. All persons employed on such works shall be employed directly by the government under an eight-hour work day and at the prevailing union wages. The government shall also loan money to States and municipalities without interest for the purpose of carrying on public works. It shall contribute to the funds of labor organizations for the purpose of assisting their unemployed members, and shall take such other measures within its power as will lessen the widespread misery of the workers caused by the misrule of the capitalist class.

2. The collective ownership of railroads, telegraphs, telephones, steamship lines, and all other means of social transportation and communication, and all land.

3. The collective ownership of all industries which are organized on a national scale and in which competition has virtually ceased to exist.

4. The extension of the public domain to include mines, quarries, oil wells, forests, and water-power.

5. The scientific reforestation of timber lands, and the reclamation of swamp lands; the land to be reforested or reclaimed to be permanently retained as a part of the public domain.

6. The absolute freedom of press, speech, and assemblage.

DEMANDS.

7. The improvement of the industrial conditions of the workers:

(a) By shortening the workday in keeping with the increased productiveness of machinery.

(b) By securing to every worker a rest period of not less than a day and half each week.

(c) By securing a more effective inspection of workshops and factories.

(d) By forbidding the employment of children under sixteen years of age.

(e) By forbidding the interstate transportation of the products of child labor, of convict labor, and all uninspected factories.

(f) By abolishing official charity and substituting in its place compulsory insurance against unemployment, illness, accidents, invalidism, old age, and death.

8. The extension of inheritance taxes, graduated in proportion to the amount of the bequests and to the nearness of kin.

9. A graduated income tax.

10. Unrestricted and equal suffrage for men and women, and we pledge ourselves to engage in an active campaign in that direction.

11. The initiative and referendum, proportional representation, and the right of recall.

12. The abolition of the Senate.

13. The abolition of the power usurped by the Supreme Court of the United States to pass upon the constitutionality of legislation enacted by Congress. National laws to be repealed or abrogated only by an act of Congress or by referendum of the whole people.

14. The abolition of the veto power of the President.

15. That the Constitution be made amendable by majority vote.

16. The enactment of further measures for general education and for the conservation of health. The Bureau of Education to be made a department. The creation of a department of public health.

17. The separation of the present Bureau of Labor from the Department of Commerce and Labor, and the establishment of a department of labor.

18. That all judges be selected by the people for short terms, and that the power to issue injunctions should be curbed by immediate legislation.

19. The free administration of justice.

PROHIBITION PARTY. The Prohibition Party held its convention at Columbus, Ohio, and on July 16 nominated Eugene W. Chafin of Illinois for president, and Aaron S. Watkins of Ohio for vice-president. The platform, which was the briefest in form of any adopted by the parties, was as follows:

The Prohibition Party of the United States, assembled in convention at Columbus, Ohio, July 15-16, 1908, expressing gratitude to Almighty God for the victories of our principles in the past, for encouragement at present, and for confidence in early and triumphant success in the future, makes the following declaration of principles and pledges their enactment into law when placed in power:

1. The submission by Congress to the several States of an amendment to the Federal constitution prohibiting the manufacture, sale, importation, exportation, or transportation of alcoholic liquors for beverage purposes.

2. The immediate prohibition of the liquor traffic for beverage purposes in the District of Columbia, in the Territories, and all places over which the National government has jurisdiction; the repeal of the internal revenue tax on alcoholic liquors and the prohibition of interstate traffic therein.

3. The election of United States senators by direct vote of the people.

4. Equitable graduated income and inheritance taxes.

5. The establishment of postal savings banks and the guaranty of deposits in banks.

6. The regulation of all corporations doing an interstate commerce business.

7. The creation of permanent tariff commissions.

8. The strict enforcement of law instead of official tolerance and practical license of the social evil which prevails in many of our cities, with its unspeakable traffic in girls.

9. Uniform marriage and divorce laws.

10. An equitable and constitutional employers' liability act.

11. Court review of post-office department decisions.

12. The prohibition of child labor in mines, workshops, and factories.

13. Legislation basing suffrage only upon intelligence and ability to read and write the English language.

14. The preservation of the mineral and forest resources of the country and the improvement of the highways and waterways.

Believing in the righteousness of our cause and in the final triumph of our principles and convinced of the unwillingness of the Republican and Democratic parties to deal with these issues, we invite to full party fellowship all citizens who are with us agreed.

MINOR CONVENTIONS AND PLATFORMS. The Populist Party held its convention at St. Louis, and on April 3 nominated Thomas E. Watson

of Georgia for President, and Samuel W. Williams of Indiana for Vice-President.

Much consideration is given in the platform adopted to the money plank, which declares that the issuing of money is a function of the government alone.

The demand is made that money be issued direct to the people and be full legal tender for all debts, public and private, and that the power to issue it be taken from the banks. The Aldrich and Fowler bills are denounced.

The platform demands government ownership of railroads and public utilities, favors the initiative and referendum, the abolition of child and convict labor, the exclusion of foreign pauper labor, an eight hour work day, the adoption of precautionary measures to prevent mining disasters, work on public improvements in times of depression for the unemployed, and a law prohibiting courts from assuming jurisdiction involving the constitutionality of any law enacted by Congress and approved by the President.

The Socialist Labor Party held its convention in New York City, and on July 6 nominated Martin R. Preston of Nevada for president and Donald Munro of Virginia for vice-president. Preston is a prisoner in the Nevada State Prison, serving a term of twenty-five years for the killing of a man in 1905. He declined to accept the nomination, and his name was removed from the ticket. August Gilhaus of New York was substituted as proxy for M. R. Preston.

CAMPAIGN ISSUES.

It is probable that no political campaign in the history of the country has been more devoid of great issues on which the parties were squarely divided than the campaign of 1908. As a matter of fact, the chief question at issue was the personal preference of the voters for Mr. Taft or Mr. Bryan. Issues involving foreign affairs were entirely absent. It is true that certain questions were discussed by the candidates at great length, as the tariff, the trusts, the guarantee of bank deposits, and the labor question, but there was no sharp line of cleavage which marked any of these questions as strong party issues. Mr. Bryan's attempt to make a national issue out of the proposal to guarantee bank deposits met with little public interest, save in the West, where certain States were considering, or had already adopted a system of bank guarantee. Finance in its larger aspects of banking and currency reform had no part in the discussion of the campaign. The question coming nearest, in the discussion of the candidates, to an issue of national importance was the relatively unimportant one relating to the issuing of injunctions in labor cases, and even this roused interest among a relatively small part of the people. For our purposes, however, it may be assumed that the issues of the campaign were the more important planks of the party platforms, and these, as interpreted by the speeches of the candidates, will be discussed as the issues of the campaign. These questions were the tariff, trusts, railway regulation, injunctions, and the guarantee of bank deposits. On these questions was laid most of the stress of the rival candidates in their campaign speeches. The following excerpts from the letters of acceptance of the Republican and Democratic candidates will convey, in a measure, the opinion of each as to

the general issues and meaning of the campaign. In his speech of acceptance at Cincinnati on July 28 Mr. Taft outlined the general meaning of the campaign as it appeared to him as follows:

"The strength of the Republican cause in the campaign at hand is in the fact that we represent the policies essential to the reform of known abuses, to the continuance of liberty and true prosperity, and that we are determined, as our platform unequivocally declares, to maintain them and carry them on. For more than ten years this country passed through an epoch of material development far beyond any that ever occurred in the world before. In its course certain evils crept in. Some prominent and influential members of the community, spurred by financial success and in their hurry for greater wealth, became unmindful of the common rules of business honesty and fidelity and of the limitations imposed by law upon their actions. This became known. The revelations of the breaches of trust, the disclosures as to rebates, and discriminations by railways, the accumulating evidence of the violation of the anti-trust law by a number of corporations, the overissue of stocks and bonds on interstate railways for the unlawful enriching of directors and for the purpose of concentrating control of railways in one management, all quickened the conscience of the people, and brought on a moral awakening among them that boded well for the future of the country. * * * * *

"The chief function of the next Administration, in my judgment, is distinct from, and a progressive development of, that which has been performed by President Roosevelt. The chief function of the next Administration is to complete and perfect the machinery by which these standards may be maintained, by which the lawbreakers may be promptly restrained and punished, but which shall operate with sufficient accuracy and dispatch to interfere with legitimate business as little as possible."

On August 12, at Indianapolis, Mr. Bryan in his speech accepting the nomination replied in a measure to Mr. Taft, and outlined the significance of the campaign as it appeared to him as follows:

"The distinguished statesman who received the Republican nomination for President said, in his notification speech: 'The strength of the Republican cause in the campaign at hand is the fact that we represent the policies essential to the reform of known abuses, to the continuance of liberty and true prosperity, and that we are determined, as our platform unequivocally declares, to maintain them and carry them on.'

"In the name of the Democratic party, I accept the challenge, and charge that the Republican party is responsible for all the abuses which now exist in the Federal Government, and that it is impotent to accomplish the reforms which are imperatively needed. Further, I can not concur in the statement that the Republican platform unequivocally declares for the reforms that are necessary; on the contrary, I affirm that it openly and notoriously disappoints the hopes and expectations of reformers, whether those reformers be Republicans or Democrats. So far did the Republican Convention fall short of its duty that the Republican candidate felt it necessary to add to his platform in several important particu-

lars, thus rebuking the leaders of the party, upon whose coöperation he relies.

"Our platform declares that the overshadowing issue which manifests itself in all the questions now under discussion, 'Shall the people rule.' No matter which way we turn; no matter to what subject we address ourselves, the same question confronts us: Shall the people control their own government, and use that government for the protection of their rights and for the promotion of their welfare? or shall the representatives of predatory wealth prey upon a defenseless public, while the offenders secure immunity from subservient officials whom they raise to power by unscrupulous methods? This is the issue raised by the 'known abuses' to which Mr. Taft refers."

Mr. Bryan in his speech of acceptance declared himself bound by the party platform in the discussions which he would make during the campaign, and that no questions which were not included in the platform would receive attention from him. This was taken by Mr. Taft and other Republican campaign speakers to mean that Mr. Bryan did not care to have the measures which he had advocated in his previous campaigns, and which had ceased to become matters of general interest or had been decisively defeated by the people, matters of discussion. These included free silver, government ownership of railroads, and anti-Imperialism, all of which at one time or another had been matters warmly advocated by Mr. Bryan. In spite of the efforts of the Republican campaigners, Mr. Bryan was not drawn out on these subjects and limited his addresses, in accordance with his declaration, to the questions treated in the Democratic platform.

THE TARIFF ISSUE. Many able and intelligent speeches were made on the tariff question by Mr. Taft and Mr. Bryan during the campaign, but it did not present itself as a squarely drawn issue between the parties. The fact that both platforms advocated a revision, the difference being practically only in degree, made it impossible that sharply divergent lines should be drawn. In his speech of acceptance Mr. Taft outlined his views on the subject as follows:

"The Republican doctrine of protection, as definitely announced by the Republican convention of this year and by previous conventions, is that a tariff shall be imposed on all imported products, whether of the factory, farm, or mine, sufficiently great to equal the difference between the cost of production abroad and at home, and that this difference should, of course, include the difference between the higher wages paid in this country and the wages paid abroad and embrace a reasonable profit to the American producer. A system of protection thus adopted and put in force has led to the establishment of a rate of wages here that has greatly enhanced the standard of living of the laboring man. It is the policy of the Republican party permanently to continue that standard of living. In 1897 the Dingley tariff bill was passed, under which we have had, as already said, a period of enormous prosperity.

"The consequent material development has greatly changed the conditions under which many articles described by the schedules of the tariff are now produced. The tariff in a number of the schedules exceeds the difference between the cost of production of such articles

abroad and at home, including a reasonable profit to the American producer. The excess over that difference serves no useful purpose, but offers a temptation to those who would monopolize the production and the sale of such articles in this country to profit by the excessive rate. On the other hand, there are some few other schedules in which the tariff is not sufficiently high to give the measure of protection which they should receive upon Republican principles, and as to those the tariff should be raised. A revision of the tariff undertaken upon this principle, which is at the basis of our present business system, begun promptly upon the incoming of the new Administration and considered at a special session with the preliminary investigations already begun by the appropriate committees of the House and Senate, will make the disturbance of business incident to such a change as little as possible."

At Des Moines, Iowa, August 21, Mr. Bryan delivered a speech devoted entirely to the tariff question. The general tendency of his opinions may be seen in the following extract:

"The Democratic plan does not contemplate an immediate change from one system to the other; it expressly declares that the change shall be gradual, and a gradual change is only possible where the country is satisfied with the results of each step taken. We elect a Congress every two years and a President every four years, and the people can soon stop any policy if the results of that policy are not satisfactory. But we believe that the experience the people have had with 'protection for protection's sake' has led them to favor a restoration of the tariff by gradual steps to a revenue basis, and we are convinced that the advantages following each step will be so pronounced and that the benefits will be so universally enjoyed that there will be no pause in the progress toward a system under which the tariff will be levied for the purpose of revenue and limited to the needs of the government. The low tariff law of 1846 did not produce a panic. On the contrary, it was so satisfactory that when the Republican party wrote its first platform ten years afterward the protection principle was not endorsed.

"The Democratic party has declared for an income tax as a part of the revenue system, and for a constitutional amendment as a means of securing this tax. Secretary Taft announces in his notification speech that he is in favor of an income tax whenever the revenues are so low as to require it, and expresses his belief that it is possible to secure such a tax without a constitutional amendment. If it is possible to frame a law which will avoid the objections raised to the income tax law of 1894, well and good, but that is uncertain. If an income tax is desirable, surely Secretary Taft cannot consistently oppose the adoption of a constitutional amendment. If the principle is right and the tax wise, Congress ought to have authority to levy and collect such a tax, and no supporter of Secretary Taft can oppose our position without dissenting from the Republican candidate."

Aside from this formal treatment, the discussion of the tariff by Mr. Bryan during the remainder of the campaign was largely perfunctory.

THE TRUST ISSUE. The issue of the regulation of trusts received hardly more attention as a party issue than the tariff. Both the candidates advocated some sort of regulation, but

their discussion was largely academic and did not arouse enthusiasm. Mr. Taft, in his speech of acceptance, advocated amendments to the Anti-Trust Law and strongly attacked that part of the plank of the Democratic platform, which suggested that corporations should be forbidden to hold more than 50 per cent. of the plant in any line of manufacture. In regard to the regulation of unlawful trusts, he spoke as follows: "Unlawful trusts should be restricted with all efficiency of injunctive processes, and the persons engaged in maintaining them should be punished with all the severity of criminal prosecution, in order that the methods pursued in the operation of their business shall be brought within the law. To destroy them and eliminate the wealth they represent from the producing capital of the country would entail enormous loss and would throw out of employment myriads of workmen and workingwomen. Such a result is wholly unnecessary to the accomplishment of the needed reform, and will inflict upon the innocent far greater punishment than upon the guilty.

"* * * The Democratic platform proposes to take off the tariff on all articles coming into competition with those produced by the so-called 'trusts,' and to put them on the free list. If such a course would be utterly destructive of their business, as is intended, it would not only destroy the trusts, but all of their smaller competitors. The ruthless and impracticable character of the proposition grows plainer as its effects upon the whole community are realized.

"To take the course suggested by the Democratic platform in these matters is to involve the entire community, innocent as it is, in the punishment of the guilty, while our policy is to stamp out the specific evil."

In an address delivered at Indianapolis on August 25 on the trust question, Mr. Bryan indicated in the following language the general attitude of his party as he conceived it on the question of the regulation of monopolies:

"Let the issue be made plain; let the distinction be accurately drawn; let the respective positions of the parties be fully understood. The Democratic party does not oppose all corporations; on the contrary, it recognizes that the corporation can render an important service to the public. The Democratic party wants to employ every instrumentality that can be employed for the advancement of the common good; but the Democratic party draws the line at the private monopoly, and declares that a private monopoly can not be justified on either economic or political grounds.

"From an economic standpoint, a monopoly is objectionable. The moment a corporation secures a practical monopoly in the production or sale of any article, certain evils appear which outweigh any good that can come from large production or control. Wherever private monopolies exist, certain irresistible tendencies manifest themselves. First, it raises prices—this is the first thing thought of for the increasing of profits. Then, in proportion as it becomes the only purchaser of the raw material, it reduces the price of the raw material, and the producer of that raw material, having no other market, must accept the price offered. In this way, too, the profits of the corporation are increased. Third, a reduction in the quality of the product affords an opportunity for increas-

ing profits. Fourth, reduction in wages follows wherever conditions will permit.

"Competition protects the purchaser, for when a number of independent producers stand ready to supply him with what he needs, he can choose between them and buy from the one who offers the best product at the lowest price. He is also protected in quality because those who compete for the opportunity to sell to him must show either advantage in price or advantage in quality. Competition protects the man who produces raw material, for when there are a number of bidders for that which is being sold, he can accept the highest price offered. Competition also helps the wage-earner, for his skill is the finished product which he offers upon the market, and where a number of independent industries are endeavoring to secure the highest skill, the skilled laborer has the best assurance of obtaining a fair recompense; when there is but one employer, the employee must take the price offered, because he will lose the advantage of his experience if he must go out to find a different kind of employment.

"The business men of the country have felt the pressure of the trusts. The retailer has been compelled to enter into contracts which restrict his management of his own affairs, he has found the terms of sale and payment changed to his disadvantage and he has been forced to carry more and more of the risks of trade. He is convinced that there are no good trusts and that his only safety is in the Democratic plan which lays the ax at the root of the tree."

THE RAILWAY ISSUE. On the question of regulation of railways by the Federal government, the rival candidates were even less specific than in their discussion of the tariff and the trusts. The chief question at issue was perhaps that of the necessity of a physical valuation of railways. Mr. Taft, in his speech of acceptance, did not commit himself to any decisive utterances, but confined his allusions to the matter of railroads to more general treatment, although he indicated that he was not unalterably opposed to the physical valuation. The tenor of his treatment of the subject may be seen from the following extract:

"The question of rates and the treatment of railways is one that has two sides. The shippers are certainly entitled to reasonable rates; but less is an injustice to the carriers. Good business for the railroads is essential to general prosperity. Injustice to them is not alone injustice to stockholders and capitalists, whose further investments may be necessary for the good of the whole country, but it directly affects and reduces the wages of railway employees, and indeed may deprive them of their places entirely.

"From what has been said the proper conclusion would seem to be that in attempting to determine whether the entire schedule of rates of a railway is excessive the physical valuation of the road is a relevant and important, but not necessarily a controlling factor."

Mr. Bryan was rather more outspoken, and his general attitude on the question may be gathered from the following extract from a speech on railroads, delivered at Peoria, Ill., on Sept. 9:

"Our platform outlines the regulation deemed necessary, and the regulation is specifically

set forth in order that our opponents may not be able to scare the public by predicting hurtful legislation. Our platform, unlike the Republican platform, says what it means and means only what it says.

"A distinction is drawn between the railroads and other corporations. The railroad, being a quasi-public corporation and, as such, being permitted to exercise a part of the sovereignty of the State, is subject to regulation at the hands of both the Nation and the State, but this regulation is intended, not to cripple the railroads but to increase their efficiency. The people at large are as much interested as the stockholders are in the successful operation of the railroads. Their own pecuniary interests as well as their sense of justice would restrain them from doing anything that would impair the road or reduce its efficiency. The traveling public is vitally interested in the payment of wages sufficient to command the most intelligent service, for life as well as property is in the hands of those who operate the trains, guard the switches, and keep the track in repair.

"The Democratic Party would distinguish between those railroad owners, directors and managers who, recognizing their obligation to the public, earn their salaries by conscientious devotion to the work entrusted to them, and those unscrupulous 'Napoleons of Finance' who use railroads as mere pawns in a great gambling game without regard to the rights of employees or to the interests of the patrons. It is in the interest of honest railroading and legitimate investment that the Democratic Party seeks to ascertain the present value of the railroad properties and to prevent for the future the watering of stock and the issue of fictitious capitalization; and it is in the interest of both the railroads and the public that it seeks only such reductions in transportation rates as can be made without wage reduction, without deterioration in the service and without injustice to legitimate investments."

THE LABOR INJUNCTION ISSUE. The most heated arguments of the campaign probably centred around the question of the modification of the laws relating to the issuing of injunctions by Federal courts. It was made a principle of the Democratic party that such injunctions should not be issued without a preliminary hearing, and that injunctions should not be issued in case of strikes, or in cases involving labor disputes, where they would not be issued if no such questions were involved. Mr. Taft favored certain modifications of the court practices respecting injunctions and expressed himself as strongly opposed to secondary boycotts and certain other practices sometimes used by trade unions. His attitude on the question of a preliminary hearing on injunctions may be seen from the following extract from his speech of acceptance:

"It is a fundamental rule of general jurisprudence that no man shall be affected by a judicial proceeding without notice and hearing. This rule, however, has sometimes had an exception in the issuing of temporary restraining orders commanding a defendant in effect to maintain the *status quo* until a hearing. Such a process should issue only in rare cases where the threatened change of the *status quo* would inflict irreparable injury if time were taken to give notice and a summary hearing. The un-

lawful injury usual in industrial disputes, such as I have described, does not become formidable except after sufficient time in which to give the defendants notice and a hearing. I do not mean to say that there may not be cases even in industrial disputes where a restraining order might properly be issued without notice, but, generally, I think it is otherwise. * * * * *

"In securing to the public the benefits of the new statutes enacted in the present administration the ultimate instrumentality to be resorted to is the courts of the United States. If now their authority is to be weakened in a manner never known in the history of the jurisprudence of England or America, except in the Constitution of Oklahoma, how can we except that such statutes will have efficient enforcement? Those who advocate this intervention of a jury in such cases seem to suppose that this change in some way will insure only to the benefit of the poor workingmen. As a matter of fact, the person who will secure chief advantage from it is the wealthy and unscrupulous defendant, able to employ astute and cunning counsel and anxious to avoid justice."

The attitude of the Democratic party as interpreted by Mr. Bryan is indicated in the following extract from a speech on injunctions delivered at Chicago on Sept. 7:

"The Democratic platform proposes no interference with the right of the judge to decide the cases of direct contempt—contempt committed in the presence of the court; neither is it proposed to interfere with the right of the judge to determine the punishment for indirect contempt. All that is sought is the substitution of trial by jury for trial by judge when the violation of the court's decree must be established by evidence. * * * * *

"While the laboring men have been the first to complain of this denial of the right of trial by jury in cases of indirect contempt, it ought not to be considered a labor question. * * * It behooves us, as lovers of our country and as the friends of liberty, to insist upon the independence of the different departments of our government and upon the maintenance of the rights which have been shown by experience to be essential to freedom and self-government. The jury system must be preserved, and we cannot hope to preserve it if, for any reason or under any pretext, we permit any citizen to be denied the protection which it furnishes."

During his service as a judge of the Superior Court of Cincinnati and as a Judge on the Federal bench, especially at the time of the great railway strike led by Eugene V. Debs, Mr. Taft delivered certain decisions in respect to labor questions in which he had issued injunctions and had also made decisions in cases involving secondary boycott. (See INJUNCTIONS.) For these decisions he was sharply criticised by Mr. Bryan and other speakers during the campaign, and the attempt was made to prove that these decisions had shown Mr. Taft opposed in general to the laboring men. The strongest speeches made by Mr. Taft in the campaign were in defense of these decisions and the frank and sincere explanation of his attitude was most favorably received by the audiences of laboring men to whom he made a point of recounting the circumstances under which the decisions were given.

THE ISSUE OF THE GUARANTY OF BANK DEPOSITS. Next to the question of labor injunctions, this issue was the most warmly debated of the questions of the campaign, especially by Mr. Bryan. A general discussion of the chief points of the proposition will be found in the article BANKS AND BANKING. Mr. Taft's attitude on the subject is indicated in the extract given below from his speech of acceptance:

"The Democratic platform recommends a tax upon national banks and upon such State banks as may come in, in the nature of enforced insurance, to raise a guaranty fund to pay the depositors of any bank which fails. How State banks can be included in such a scheme under the Constitution is left in the twilight zone of State's rights and federalism so frequently dimming the meaning and purpose of the promises of the platform. If they come in under such a system, they must necessarily be brought within the closest national control, and so they must really cease to be State banks and become National banks.

"The proposition is to tax the honest and prudent banker to make up for the dishonesty and imprudence of others. No one can foresee the burden which under this system would be imposed upon the sound and conservative bankers of the country by this obligation to make good the losses caused by the reckless, speculative and dishonest men. * * * In short, the proposal is wholly impracticable unless it is to be accompanied by a complete revolution in our banking system, with a supervision so close as practically to create a government bank. If the proposal were adopted exactly as the Democratic platform suggests it would bring the whole banking system of the country down in ruin."

That Mr. Bryan was enthusiastically in favor of the plan will be shown by reading the following extract taken from a speech made on the subject in Topeka on August 27:

"The chief cause of bank failures is the making of excessive loans to directors or officials of the bank. This is the fruitful cause of disaster, and it has been impossible to secure legislation protecting banks from their own officials and directors. Why? Because there has been no mutual responsibility. When all banks become liable for the deposits of each, the stockholders will insist upon the enactment of a law making it a criminal offense for a bank official to loan more than the prescribed amount to one individual. At present we have a law prohibiting the loaning of more than one-tenth of the capital and surplus to one person or corporation, but the law is only directory. Of course, the Comptroller can suspend a bank if it violates the law, but the law is not enforced, because the enforcement of such a law would throw the punishment upon innocent stockholders and upon the community, since the suspension of a bank inflicts a great loss upon stockholders and disturbs the business of the city or town in which the bank is located.

"The law should make it a criminal offense to loan more than the prescribed amount to one person, and we would probably be able to secure the passage of a law prohibiting market speculation by bank officials.

"Why not make the depositor secure? The United States government requires the deposit of specific security when it intrusts money to

a national bank, although it can examine the bank at any time; the State requires security when it deposits money in a bank; the county requires security and the city requires security; even the banks require security from the officials who handle money. Why should the depositor be left to take his chances?

"Not only is the depositor without protection, but the security given to nation, State, county and city lessens his security. They are preferred creditors; they have a mortgage on the gilt-edged assets and the depositor must get along as best he can with what remains. Why are the interests of depositors thus neglected?

"A bank asks deposits on the theory that the depositor is sure of the return of his money, and the laws ought to make the facts conform to the theory. The depositor, the community and the banker himself will be benefited by legislation which will give to every depositor the assurance that that which is committed to the keeping of the bank will be available to meet his needs at any time. Such is not the case to-day, for while all banks are reasonably secure, they are not absolutely so. This statement can be verified in several ways."

MINOR ISSUES. The question of the publicity of campaign fund contributions received a considerable amount of discussion during the campaign, especially on the part of Mr. Bryan, who made much of the failure of Congress at its last session to pass a bill making publicity of contributions compulsory and also the refusal of the Republican delegates to incorporate such a plank in the party platform at the National Convention. Early in July, Mr. Taft, in reply to a telegram from Mr. Bryan relating to the matter, expressed himself as heartily in approval of publicity. George R. Sheldon of New York had been appointed treasurer of the Republican National Committee, and the selection of New York City as the principal headquarters of the committee for the campaign made it obligatory that the contributions received for carrying on the Republican campaign should be made public, as the laws of the State of New York require this. The chief question at issue therefore, was whether the contributions should be made public before or after the campaign. Following Mr. Bryan's announcement, the Democratic National Committee decided to make public such contributions at designated intervals during the campaign, as well as afterwards, while the Republican National Committee reserved the right to wait until after the campaign had been concluded.

The question of imperialism was not a vital one, but Mr. Taft delivered several addresses in which he defended the course of the government in the Philippines. The issues of the smaller parties of the campaign are sufficiently indicated in their platforms and will be found under that section of this article.

PROGRESS OF THE CAMPAIGN.

Following the nominating conventions, the campaign was slow in starting. On July 8, Frank H. Hitchcock was elected chairman and George R. Sheldon treasurer of the Republican National Committee. Headquarters were established in New York and in Chicago. On July 17 the Democratic candidates issued an appeal to the farmers of the country asking for special contributions to the campaign fund. At a meeting of the Democratic National Committee at

Chicago, Norman E. Mack was chosen chairman and Gov. Charles N. Haskell, of Oklahoma, treasurer, for the campaign. The chief headquarters of the committee were established in New York. On July 28 at Cincinnati Mr. Taft was officially notified of his nomination for the Presidency. He outlined in a long speech the principles on which he purposed to conduct the campaign. Mr. Bryan was notified of his nomination for the Presidency on Aug. 12, at his home in Lincoln, Neb. In his speech of acceptance he attacked the Republican party and established as the catchword of the campaign the slogan, "Shall the People Rule?" On Aug. 21 Mr. Bryan formally opened his campaign by delivering an address on the tariff at Des Moines, Iowa. This address was the first of a series in which he purposed to discuss seriatim the chief issues of the campaign. Mr. Taft announced on Aug. 22 his purpose, if he were elected, to call a special session of Congress for the revision of the tariff as soon as possible after March 4, 1909. On Aug. 28, he delivered a speech criticising strongly Mr. Bryan's plan for Federal guarantee of national bank deposits, and on the following day Mr. Bryan defended this plan by a speech delivered at Topeka. The fight in Ohio carried on by Senator Foraker against Secretary Taft, prior to Mr. Taft's nomination (see OHIO), was temporarily suspended by a meeting between Mr. Taft and Senator Foraker, brought about on Sept. 2, in which the latter pledged his support to the Republican National ticket.

The Republican campaign was formally opened by Governor Hughes of New York, Senator Beveridge of Indiana, and Governor Harris of Ohio, at Youngstown, Ohio, Sept. 5. The speech delivered by Governor Hughes was, for clearness, logic and conciseness of expression, probably unsurpassed during the campaign. At the beginning of the campaign Mr. Taft had expressed his intention of making no campaign tours. He decided, however, on Sept. 5, that he would make an extended speaking trip about the end of the month. Mr. Bryan on Sept. 6 began a tour which lasted three weeks. President Roosevelt had been strongly importuned to take an active speaking part in the campaign, but this he refused to do. On Sept. 13, however, he made public a letter, in effect a campaign document, strongly endorsing Mr. Taft. The campaign up to this point had lacked any striking features and had aroused little apparent public interest. About the middle of September, however, a disturbing element appeared in the person of Mr. William R. Hearst, who, in a speech made in support of Mr. Hisgen, the nominee of the Independence Party, made statements in which he asserted that Charles N. Haskell, the treasurer of the Democratic National Committee, had been in strong affiliation with the Standard Oil Company, and that he was one of three men who had undertaken, through the alleged offering of bribes, to obtain the dismissal of suits against the company in Ohio. Mr. Haskell denounced these statements as falsehoods. A still greater sensation was caused by the production by Mr. Hearst of certain letters from a high official of the Standard Oil Company to Senator Foraker, of Ohio. The letters, which bore the signature of John D. Archbold, indicated that Senator Foraker had, at one time, received checks from the Standard Oil Company, presumably in payment for serv-

ices he had rendered to that corporation. Mr. Foraker denied that any of the money received from the Standard Oil Company had been employed illegitimately. In respect to one of the checks, which was for \$50,000, Mr. Foraker explained that it was in furtherance of an attempt to buy the *Ohio State Journal*, which was a bitter opponent of Republican policies in the State of Ohio. See STANDARD OIL.

The situation which had developed in regard to Senator Foraker destroyed the temporary agreement between him and Mr. Taft in regard to Ohio. Senator Foraker took no active part in the campaign, following these disclosures.

The assertions of Mr. Hearst in regard to Governor Haskell drew from President Roosevelt an attack on Governor Haskell, and by implication, on the Democratic party, of whose campaign committee he was the treasurer. To this attack Mr. Bryan replied on Sept. 22 with a long telegram to President Roosevelt, in which he resented strongly the statements made by the President and defended the action of the convention in selecting Governor Haskell as chairman of the committee on resolutions and as treasurer of the National Democratic Committee. To this telegram President Roosevelt replied on Sept. 23 with a letter in which he did not attempt to give detailed proof that Governor Haskell had been involved in the alleged attempt to secure favors for the Standard Oil Company by means of bribes, but dwelt almost entirely on the governor's action in dealing with the injunction suit brought against the Prairie Oil and Gas Company, a concern affiliated with the Standard Oil Company. Governor Haskell, just prior to the meeting of the Democratic National Convention, had dissolved an injunction preventing this company from laying pipe lines in the State of Oklahoma, although the attorney-general of the State had protested against such action. President Roosevelt declared that Governor Haskell's close relations with the Standard Oil interests while he was a resident of Ohio were a matter of common notoriety. He invited Mr. Bryan to contrast the action of Judge Taft in practically repudiating Senator Foraker, with Mr. Bryan's action in the case of Governor Haskell. He reminded Mr. Bryan that when he selected Mr. Haskell as treasurer of the Democratic Committee he must have been familiar with what had been done in the matter of the Prairie Oil and Gas Company injunction. The President said that "while it was a matter of common notoriety about Senator Foraker that he was the defender and supporter of great corporations, and thereby hostile to the policies for which this administration has stood, there was no such convincing proof against Senator Foraker at that time as there was against Governor Haskell when, as you say, he was, with your approval, made treasurer of your campaign committee." The President declared that "Governor Haskell is entirely unfit for any public position of trust, or for association with any man anxious to make an appeal on a moral issue to the American people." This he said had been abundantly shown, irrespective of his action in connection with the Standard Oil Company's interests. To this letter Governor Haskell on Sept. 24 gave out a reply which commented with great bitterness on the President's aspersions upon him. He asserted that the franchise of the Prairie Oil and Gas Company had

been obtained, not from him, but from the Secretary of the Interior in President Roosevelt's cabinet, and that he had only respected the franchise which existed. On Sept. 25 Mr. Haskell resigned as treasurer of the Democratic National Committee, and Herman Ridder, of New York, was appointed to take his place. On Sept. 6 Mr. Bryan sent a long letter to President Roosevelt in which he again defended Mr. Haskell. The letter, however, was devoted chiefly to an attack against the general policies of the Republican Party in receiving campaign contributions from corporations and its failure to prosecute trusts. President Roosevelt refused to continue the correspondence with Mr. Bryan. Mr. Hearst continued to read letters bearing on the relations of the Standard Oil Company with prominent politicians of both parties and especially with Senator Foraker. On Sept. 25 Senator Foraker issued a long statement denying the charges made against him and bitterly criticising President Roosevelt for the aspersions made upon him on Sept. 21. Gen. T. Coleman du Pont, head of the Bureau of Speakers in the Republican campaign, on Sept. 25 resigned his office at the suggestion of Chairman Hitchcock. General du Pont was the head of the so-called "Gunpowder Trust," against which the Federal government has begun proceedings, and his continuance as an active official of the campaign was deemed inconsistent.

In the latter part of September and the first days of October Mr. Taft made a speech-making tour as far west as Colorado and Wyoming. In the middle of October he visited the South with the avowed intention of showing that section of the country that its prosperity depended on the enforcement of the Republican policies. On Oct. 15 the list of contributors to the Democratic National campaign fund up to that date was made public. The contributions amounted to about \$250,000. On Oct. 21, President Roosevelt began to take an active hand in the campaign by making public a letter to Senator Knox, of Pennsylvania, in which he called upon Mr. Bryan to indicate his attitude toward the labor question. He declared that the Democratic platform promise really meant the enactment of a law to strip lawful business of all protection from violence and to legalize the blacklist and secondary boycott, while at the same time it was an attempt to delude labor because such a law would be rejected as unconstitutional by the Supreme Court. Mr. Bryan refused to reply specifically to these charges, but insisted that he had already replied to them in speeches made during the campaign. Both candidates concluded their campaigns by concentrating their efforts on New York. The State's electoral vote was at that time considered necessary for the election of either candidate. The struggle had been waged warmly in other doubtful States, such as Indiana and Illinois, where local conditions had changed normally Republican States to doubtful States. Mr. Bryan proved himself during the campaign a wonderful debater, as in the two previous campaigns in which he had been the candidate. His endurance under the great physical demands made by his constant speaking and travelling was little short of phenomenal. Mr. Taft, who had no reputation as an orator, showed himself, a logical and convincing speaker, and his active campaign unquestionably won

for him many votes which he might otherwise have lost.

Of the campaigns made by the minor parties little need be said. Mr. Debs, the Socialist candidate, made a tour of the country in a special train and spoke to large and enthusiastic audiences. The chief feature of the campaign of the Independence Party was the disclosures made by Mr. Hearst referred to above. An attempt made by Samuel Gompers, President of the American Federation of Labor, to influence the "labor vote" for Mr. Bryan met, as is indicated by the results of the election, with little success. Mr. Chafin, candidate of the Prohibition Party, made an aggressive campaign.

RESULTS OF THE ELECTION.

The results of the election giving the popular and electoral vote by States will be found in the table on p. 594. Comment upon the results in the different States will be found in the political section on the States.

The total popular vote cast for all candidates was 14,961,924, taking the highest vote received by the electors in the States. Of these votes Taft received 7,811,143; Bryan, 6,328,601; Debs, 448,453; Chafin, 241,252; Gillhaus, 15,421; Watson, 33,871; and Hisgen, 83,183. The popular majority of Taft over Bryan was 1,482,542, and the popular majority of Taft over all other candidates was 660,362. These figures may be compared with those cast in the Presidential election of 1904, when the total vote cast was 13,510,708, of which Roosevelt received 7,623,486; Parker, 5,077,971; Debs, 402,283; Swallow (Pro.), 258,536; Watson (Pop.), 117,183; Corrigan (Soc. L.), 31,249. From these figures it will be seen that although Taft in 1908 received 7,811,143 votes, as compared with 7,623,486 cast for Roosevelt in 1904, Bryan in 1908 received 6,328,601, as compared with 5,077,971 for Parker in 1904, or considerably more than a million votes over those cast for Parker. Of the 483 votes in the electoral college, Taft received 321 and Bryan 162, as compared with 336 for Roosevelt and 140 for Parker in 1904. Had the complicated election returns in Maryland not resulted in the splitting of the electoral vote so that Bryan received six and Taft two, the result in the electoral college would have been either 489 for Taft or 164 for Bryan. Outside of the States known as the "Solid South," which are always counted previous to an election as Democratic, and the border States, Bryan carried but four States, Colorado, Nebraska, Nevada, and Oklahoma. Of the border States he lost an equal number, Maryland (by a divided vote), West Virginia, Missouri, and Delaware. In several of the Eastern States, Rhode Island, New York, Massachusetts, and Connecticut, Taft's pluralities ran ahead of those received by Roosevelt in 1904.

One of the most notable features of the election was the comparatively small vote cast for the candidates of the minor parties. Thus, in spite of the unusually aggressive campaign made by Debs, the Socialist candidate, accompanied by repeated claims that the Socialist vote would exceed a million, the vote really cast was only 46,000 more than the vote cast in 1904, while the vote cast for the Prohibition candidate was about 17,000 less than that cast in 1904. Still more significant was the decrease in the Populist vote. Thomas E. Watson, who was the candidate in both elections, received 117,183 votes in 1904, while in 1908

he received but 33,871. The vote of Hisgen, candidate of the Independence Party, was so small as to be negligible in the general results. Another remarkable feature of the election was the disappearance of organized labor as a factor in the contest. In spite of the impassioned appeals of Mr. Gompers, president of the American Federation of Labor, that the vote of the laboring men be cast for Bryan, and in spite, too, of his repeated assertions that this would be the case, there is no evidence in the returns that the labor vote was not cast quite as independently as any other.

Next to the results of the votes for President, interest centered about the probable issue in New York State, where, although it was generally conceded that Taft would receive a majority of the votes cast, the Democrats had more confidence than for several years in the election of their candidate for governor. Although Hughes, the Republican candidate, had the confidence and support of the rank and file of the Republican party, he was out of touch with its leaders, and the Democrats had put forward an able and aggressive candidate in Lewis S. Chanler. The results in the State, and especially in the city of New York, were surprising. Taft received a plurality in the State of 202,602, while Hughes' plurality was 69,462. Greater New York gave Taft a plurality of over 15,000. Even New York county, the old city of New York, which is normally Democratic by a large majority, gave Bryan less than 6,000 plurality.

There were interesting and significant features in other States. Indiana, which was considered a doubtful State by both parties, gave Taft a plurality of 10,731, while Marshall, the Democratic candidate for governor, was elected over Watson, the Republican candidate, by 14,353. In Illinois, Taft received the enormous plurality of 179,122, while Deneen, the Republican candidate for governor, was elected by a plurality of only 23,164. Ohio, normally a strong Republican State, gave Taft a plurality of 69,591, while Harmon, the Democratic candidate for governor, defeated Harris, the Republican candidate, by 19,372. Minnesota, another strong Republican State, gave Taft a plurality of 85,822, while Johnson, the Democratic candidate for governor, was elected by a plurality of 20,178. This result is largely accounted for by the great personal strength of Governor Johnson in the State. In most States Taft ran ahead of the Republican State ticket and Bryan behind the Democratic ticket. There was an exception to this in Missouri, where Hadley, the Republican candidate for governor, received a plurality of 15,789, while Taft's plurality in the State was 1629.

One of the most interesting features of the election was the strong attempt made to defeat Speaker Cannon for reelection in Illinois. Many religious and reform organizations united in this endeavor on the ground that Mr. Cannon was morally and politically disqualified for reelection. Although his vote was somewhat reduced, he was reelected by a safe plurality. Among local results, interest attached to the reelection of Judge Dunne, of San Francisco. It was he who sentenced Schmitz and Ruef to prison and a hard fight was made against his reelection. Interesting and significant, too, was the reelection of Judge Ben B. Lindsey, of Denver. Judge Lindsey has won international fame as judge of the Juvenile Court, and his work

in the redemption of juvenile offenders has been highly praised. He ran on an independent ticket against two regular party candidates, and his vote was almost as large as that of both his competitors combined. One of the most satisfactory local results of the election was the

vote against the continuance of the present divorce laws in South Dakota. (See DIVORCE.) Perhaps the most generally significant feature of the election was the strong tendency in many States toward independent voting, as reflecting a growing disregard of strict party lines.

POPULAR AND ELECTORAL VOTE FOR PRESIDENT IN 1908.

PRICES. The period of industrial prosperity stretching from 1898 to 1907 was a decade of rising prices, while the year following the collapse of Oct., 1907, was one of lowered prices. In the March *Bulletin* of the United States Bureau of Labor appeared the results of an investigation into wholesale prices from 1890 to 1907, inclusive. The report covered 258 representative articles. The results showed that wholesale prices in 1907 were 5.7 per cent higher than in 1906, 44.4 per cent higher than in 1897, the year of lowest prices for the eighteen years studied, and 29.5 per cent higher than the average for the ten years, 1890 to 1899, inclusive. The highest level of the entire period was reached in Oct., 1907; and the lowest prices in 1907 were those of December. Of the 258 articles recorded, 172 showed increases in price in 1907 over 1906, 35 no change, and 51 decreases. The greatest average increase was in farm products. Of 53 foods, 34 showed increases in 1907 as compared with prices in 1906,

while 13 showed decreases. Of 75 cloths and articles of clothing, 54 showed increases and only 10 decreases.

In the July *Bulletin* the same bureau published a study of retail prices of food based on 30 staple food commodities sold in 68 localities in the United States by 1,014 dealers. This showed that such prices were 4.2 per cent higher in 1907 than in 1906, being higher in each month of 1907 than in the corresponding month of 1906. The average prices of 20 of the 30 articles were higher in 1907 than in any other year of the eighteen years, 1890-1907; while all of them, except the price of coffee, were higher in 1907 than in 1896, the year of lowest retail prices. Taking the average prices of the decade 1890 to 1899 as equal to 100, the average for 1901 was 105.5; for 1903, 110.9; for 1905, 112.5; for 1907, 120.7. The maximum was reached in Dec., 1907, when the average on this same basis was 125, as compared with 117.8 for June. The 1907 averages for various commodities, tak-

ing as 100 the average for the decade 1890-1899, were as follows: Fresh beefsteaks, 120.6; butter, 127.6; cheese, 123.2; dressed cold-storage chickens, 131.4; coffee, 95; eggs, 137.7; fresh fish, 120.6; wheat flour, 117.7; fresh milk, 116.8; mutton, 130.1; fresh pork, 142.5; bacon, 157.3; ham, 130.7; Irish potatoes, 120.6; sugar, 99.6; tea, 105.3; veal, 125.

On the basis of these results the bureau computed what had been the change in the cost of food for workingmen's families. The results of an inquiry made in 1901 were also brought into use. This inquiry covered 2,567 workingmen's families in various parts of the United States. The average size of family was 5.3; the average income per family \$829.19, and the average expenditure for food \$326.90. The computation made on the basis of increased prices gave as the average expenditure per family for food in 1903 \$342.75; in 1905, \$349.27; and in 1907, \$374.75.

According to *Bradstreet's* approximate price index numbers, commodities maintained remarkably high and steady prices during 1908, considering the state of industry. The highest point of the year was that of Jan. 1, when the index was \$8.2949; the lowest was June 1, \$7.7227; and that of Jan. 1, 1909, was \$8.2756. These may be compared with \$9.1293 on Mar. 1, 1907, the maximum of recent times, and with \$6.802 on Jan. 1, 1899.

ENGLAND. The tables of index numbers published by the London *Economist* showing the average level of commodity prices are significant not only of the relative cost of living in England at different dates, but in most countries of the civilized world. The numbers for designated years were as follows: 1891, 2,240; 1897, 1,885, the lowest since 1860; 1907, 2,494. The highest level in thirty years was reached June 1, 1907, when the index number was 2,601. On Oct. 1, 1907, the index was 2,457; it dropped slowly but steadily until June 1, 1908, when it was 2,188; it rose two points in July, but on Sept. 1 stood at the low point of the year, 2,188; on Dec. 1, it was 2,198.

PRIMARIES, DIRECT. A notable political feature of the year was the enactment of several new primary laws and the results obtained by this method of nominating candidates for public office. The direct primary has been in use in a number of Southern States for some years. The existence of only one strong party there makes the primary nominations practically equivalent to election. But favor for this system has so spread that now fully two-thirds of the States have adopted it more or less fully. States enacting new laws or amending old ones on primary elections during 1908 were Illinois, Kansas, Louisiana, Michigan, Mississippi, Missouri, New Jersey, New York, and Ohio. Besides general interest in many States active interest was aroused in New York by Governor Hughes, and in New Hampshire by Winston Churchill.

The Illinois law is one of the most comprehensive yet enacted. It provides for the nomination of all elective officers, except Presidential electors, State University trustees and township and school officials, and of committeemen of all political parties, by the direct vote of members of the various political parties. All parties are required to hold primaries on the same day, voting by election precincts. Separate ballots are authorized for each party, and

the voter must announce his party affiliation before receiving a ballot. The expense of primaries is borne by the public. The new law applies to congressional, senatorial, State, county, and local elections. Moreover, it legalizes party organization by recognizing existing political parties, prescribing rules for the calling of party conventions, and providing for the organization of State and county committees. The thorough-going character of this law is at once apparent. The first test of it was made in Aug., 1908. Opinions as to its success were various. Opponents of the law charged that in some cases the least desirable candidate was chosen because the vote of the better element was divided between desirable men, while politicians and special interests united their strength. In Chicago wholesale fraud was charged. A special grand jury after gathering evidence for weeks returned eighty-one indictments and enumerated fourteen fraudulent practices proven to have been used in this first primary. Among these were fraudulent registration, "repeating by platoons of men," voting names of absentees, non-residents, insane and dead men, perjury, intimidation and handing voters ballots already marked. The jury said: "We find that no confidence can be placed in the reported results in favor of, or against any candidate for a party nomination at the primary election."

In Kansas the first direct primary, under a new and comprehensive law, resulted in the defeat of the regular machine candidates and the nomination of more independent and radical candidates. The first trial of the new law in Missouri resulted in charges of extensive fraud in St. Louis. As at Chicago, it was charged that scores of henchmen of one party were loaned to politicians of the opposing party for use in different precincts. This same fraud was disclosed in Nebraska and Michigan. In New Jersey also the new law was put to its first test. This law was largely due to the efforts of the "new idea" senator, Everett Colby. A vigorous effort by politicians and corporations was made to defeat his nomination for reelection, but in vain. His success is pointed to as a clear victory for popular and good government made possible by the direct primary. In Oregon, where the mandate of the people on candidates for the United States senatorship was made legally and politically binding on members of the legislature by pledges signed before election, a Democrat was nominated by the people for senator, though Republican State officers and Legislature were chosen. In Washington an open revolt against the Republican machine was successfully carried through, largely because of the direct primary. However, experience has shown some defects in the Washington law. It does not prevent members of one party from voting at the other's primary; and confusion results from the provision that when there are four or more candidates for nomination the voter must indicate both a first and a second choice. The object of this device is to prevent nominations by a minority of voters, but its apparent complexity has resulted in the disfranchisement of many fairly intelligent voters. Finally, in Wisconsin the nomination of Senator Isaac Stephenson for reelection was another instance of the inability of Senator La Follette, the author

of the primary law in that State, to control its operation.

The year's experience was most suggestive. Direct primaries are found to be very expensive for candidates. They necessitate the double expense of securing nomination and then of securing election. Moreover, they further favor wealthy candidates in that they tend to shift the expense of elections from corporations and other similar interests to the candidates themselves. This, however, is fully offset by the fact that they tend to weaken corporate power in politics, and lessen the power of political machines built on the spoils system. As a rule good men are nominated and known reactionaries defeated. Moreover, voters can assert their wishes directly in the choice of candidates instead of being limited to a choice between two, both of whom may be unfit. They sometimes result in nomination by minorities or mere pluralities; but this has not resulted in the disruption of party loyalty, nor otherwise raised serious objection. The national leaders during the 1908 campaign claimed that the direct primary accentuated local and factional differences and disorganized party control. Professional politicians have generally been disappointed with the results of direct primaries and no doubt they do give party members an effective check on the power of party bosses. At the same time those reformers who thought the primary a panacea for all social and political evils have also been disappointed. For a study of American experiences and tendencies see *Direct Primaries* (Chicago, 1908), by Dr. C. E. Merriam.

PRINCE EDWARD ISLAND. An insular province of Canada. Area, 2,184 miles. Population in 1901, 103,259. Charlottetown, the capital, had 12,080 inhabitants in 1901. (For details respecting population, education, production, commerce, etc., see CANADA.) The provincial government consists of a Lieutenant-Governor, appointed by the Governor-General of Canada and acting through an Executive Council, or responsible Ministry, and a unicameral House of Assembly of 30 elective members. The present Lieutenant-Governor is Donald A. McKinnon, appointed Oct. 3, 1904. The present Premier is Francis L. Hazard.

HISTORY. The provincial elections were held on Nov. 18, when the Liberal government of Premier F. L. Hazard was returned by a small majority. The Liberals have been in power for over seventeen years. J. A. Mathieson is leader of the Conservative opposition, which numbers fourteen members to the government's sixteen. The issues were mostly local, and on some of them, especially the desirability of restoring the island's original representation in the Dominion Parliament, both sides were practically agreed. An educational commission was appointed to inquire into and report upon desirable changes, with special reference to instruction in agriculture. On account of the readjustment of federal subsidies in 1906 the revenue had been increased by \$70,000 a year and the financial condition of the province was much more prosperous than for many years. Among those defeated on the Liberal side were three members of the cabinet, S. E. Reid, commissioner of agriculture, and J. W. Clark and Peter McNutt, ministers without portfolios. As a new commissioner of agriculture would have to be appointed and might possibly fail to be elected,

the position of the government at the close of the year was not thought to be secure.

PRINCETON UNIVERSITY. An institution of higher learning at Princeton, N. J., founded in 1746. In the academic year 1908-9 there was an attendance of 1,314, divided as follows: Graduate students, 91; academic department, 625; John C. Green School of Science, 533; special students, 4; students qualifying for regular standing, 61. The faculty and instructors numbered 161. The university lost during the year two members of the board of trustees, Dr. Elijah R. Craven, who died on Jan. 5, and Hon. Grover Cleveland, who died June 24. Two members of the faculty, Professor Charles Augustus Young, professor of astronomy, and Professor Walter Augustus Wyckoff, died during the year. The Palmer physical laboratory was opened for classroom and experimental work on Oct. 15, 1908. The Stafford Little lectureship on public affairs, left vacant by the death of Mr. Cleveland, was filled by George Brinton McClellan, who will deliver his first lectures sometime during the spring of 1909. Rapid progress was made during the year toward the completion of the dormitory which is being erected by the class of 1877. Plans for the dormitory presented to the university by Mrs. Russell Sage were perfected during the year. The year was marked by the successful institution of the honors course in the classical humanities. This is an effort to put interesting and stimulating classical study at the service of all undergraduates who are able to use the classical languages with some ease and pleasure, whatever department they may have chosen in their main field of work. President Wilson in his annual report notes the success of the experiment of uniting in some degree the work of the Cliosophic and American Whig societies with the work of the university so far as the freshmen members of these societies are concerned. Courses in the study of oratory and debate have been arranged which freshmen members of the societies may substitute for the regular courses provided for them in English. Sophomore Commons was successfully inaugurated at the beginning of the year. President Wilson recommends the establishment of a new deanship, to be called the deanship of the department of science, and he further recommends that the superintendence of discipline, now invested in the dean of the faculty, be vested in a dean, to be called the Dean of Discipline, and that the duties of the dean of the faculty be confined to the presidency of the faculty in the absence of the president of the university. The receipts for the year were \$605,578, of which \$174,486 were from gifts. In addition there was received for the endowment fund \$524,932. The total productive funds of the university amount to \$3,739,200. The library contains 342,000 volumes. The president is Woodrow Wilson.

PRIVATE BANKS. The number of private banks on June 1, 1908, was 1,007, as against 1,141 one year earlier. Their resources aggregated only \$161,541,000, as compared with \$195,031,000 in June, 1907. The principal items of resources were: Loans on real estate, \$19,610,000; other loans and discounts, \$87,748,000; due from other banks, \$27,298,000; checks and cash, \$10,027,000. The principal liabilities were: Capital stock, \$21,122,000; surplus and other profits, \$9,031,000; deposits, \$126,673,000. Pri-

vate banks were found in 29 States, but about 80 per cent of all of them were in the Middle Western States, Ohio, Indiana, Illinois, Michigan, Minnesota, Iowa, and Missouri. Private banks in the first three States named numbered more than one-half of all, and had 45 per cent of the capital and 62 per cent of the deposits of all private banks; that is, they numbered 551 with \$9,695,800 capital, and \$78,990,800 deposits. In Iowa there were 111 private banks, with \$2,259,000 capital and \$13,100,000 deposits. All private banks in Minnesota, which numbered 117 in June, 1907, expired by legal limitation in April, 1908, most of them becoming State banks. The only other States in which private banks have any aggregate importance are Pennsylvania, Texas, South Dakota, Kansas, California, and Washington. Taking all banks of this country of whatever kind as the basis, private banks held only 1 per cent of total individual deposits and .6 per cent of cash on hand; their loans were only 1 per cent of the total, and their capital, surplus, and undivided profits only .088 per cent. of the total.

PRIVETTI, GIULIO, MARCHESE. An Italian statesman, died at Rome on June 6, 1908. He was born in Milan in 1851, entered Parliament in 1882, and in 1896 became minister of public works in the Rudini cabinet. A year later he was forced from office by the corruptionists, whom he had antagonized in attempting an honest administration of his department. He became minister of foreign affairs in the Zanardelli cabinet in 1901 and retained office until forced to retire from public life by a stroke of paralysis in 1903. His term of office was marked by a renewal of the Triple Alliance and by efforts to extend Italian influence in Albania and Tripoli.

PROCTOR, REDFIELD. An American statesman, United States Senator from Vermont, died in Washington, D. C., on March 4, 1908. He was born in Proctorsville, Vt., on June 1, 1831, the son of a farmer, manufacturer and store-keeper, in whose honor that town was named. He graduated at Dartmouth in 1851, and at the Albany Law School in 1859, and began to practise in Boston, in the office of his cousin, Judge Isaac F. Redfield. At the beginning of the Civil War he became quartermaster of the Third Vermont Volunteers. He became major

of the Fifth Vermont in 1861, and colonel of the Fifteenth in 1862, and served on the staff of General William F. ("Baldy") Smith. Soon after the war he was made receiver of a marble firm, while practising law in Rutland, Vt., and as the result of this opportunity eventually became the head of the largest marble business in the country. He greatly improved the quarrying business, introducing the most effective machinery and developing transportation facilities, and in 1880 became president of the Vermont Marble Company, which in that year was formed by a combination of two rival companies of one of which he had been the head. Colonel Proctor was a member of the Vermont Legislature in 1867, 1868, and 1888; a member and president of the Vermont Senate in 1874-75; lieutenant-governor of that State in 1876-78, and governor in 1878-80. He was a delegate to several of the Republican National Conventions, and in March, 1899, was appointed by President Harrison Secretary of War, which office he held until 1891, when he resigned to accept an appointment to the United States Senate, in the place of George F. Edmunds, resigned. He was elected by the Legislature in 1892 to fill the unexpired and full terms, and thereafter was successively re-elected. His term would have expired in March, 1911. Senator Proctor's most noteworthy public service was his investigation of the Cuban reconcentrado system in March, 1898. It is probable that this report did more than any other single public utterance to create the state of public opinion which made war with Spain inevitable. After the war, Senator Proctor revisited Cuba, and thereafter made another speech in the Senate in which he strongly opposed the annexation of the island to the United States. The site and building of the Tuberculosis Hospital, at Burlington, Vt., was given to the State by Senator Proctor in 1905, together with an endowment fund of \$100,000.

PROFESSIONAL SCHOOLS. The accompanying table gives statistics of the professional schools in the United States in the years 1906-7. The schools included are those of theology, law, medicine, dentistry, pharmacy, and veterinary surgery. The figures are from the report of the United States Commissioner of Education for 1907.

GENERAL SUMMARY OF STATISTICS OF PROFESSIONAL SCHOOLS FOR 1906-7.

Class	Schools	Students	Increase (+) or decrease (-)	Students having literary degree (a)	Value of grounds and buildings (a)	Endowment funds (a)	Income (a)
Theological	162	9,178	+1,210	3,003	\$15,070,400	\$24,601,600	\$2,445,800
Law	101	16,700	+1,289	3,311	2,872,000	1,496,400	890,800
Medical	152	23,720	-1,204	1,591	12,612,856	2,774,243	1,245,068
Dental	57	6,919	+ 43	75	1,639,681		235,582
Pharmaceutical	71	5,047	- 98	38	580,750	20,398	143,396
Veterinary	13	1,692	+ 247	38	553,100		132,437

(a) So far as reported.

PROHIBITION. The extensive and effective movement against the liquor traffic, which was a very prominent event in 1907, continued its progress during 1908. While the practical results in the latter year were less spectacular than in the preceding, the movement was even more widespread and fully as determined. At the close of the year fully 36,000,000 persons in the United States were living under some form

of prohibition. During 1908 "dry" territory was increased by 325,000 square miles containing a population of 4,300,000. There was much less religious excitement and dogmatism in the agitation in 1908 than in 1907, arguments were listened to in a spirit of greater fairness, and practical questions of expediency were given more weight. While still very powerful in the Southern States the movement led by the Anti-

Saloon League gained noticeably in the North Central and New England States, and made its influence felt in almost every State in the union.

Almost three score temperance measures were introduced into Congress early in the year. Not less than twenty-five of them were of the same intent as the Littlefield bill, namely, to forbid the shipment of intoxicating liquor from "wet" into "dry" territory. The constitutionality of such measures was considered by the judiciary committees of both House and Senate. After arguments had been presented on constitutional limitations Senator Bacon drew up a bill providing that a State, through its police powers, should have absolute control over intoxicating liquors within its borders, from whatever source derived. This measure was not acceptable to the judiciary committee because it would give State authorities control over interstate commerce, a shipment not being considered complete until it reaches the consignee. Still another group of bills, numbering about twenty-five, sought to check the liquor traffic by forbidding the issue of Federal licenses in prohibition territory or until the applicant had secured a valid license from the State, county, or city where the liquor was to be sold. There was a bill prohibiting the manufacture and sale of intoxicating liquors in the District of Columbia; also one establishing there a model high license system. On the other hand three bills favored the restoration of the army canteen.

This flood of bills in Congress was outdone by the introduction of hundreds (estimated as high as 2,500) in State legislatures. Many of minor importance and a few of general significance were passed. In Mississippi, where 69 of the 76 counties had already adopted prohibition by local option, the legislature voted unanimously in February for a State prohibitory law to take effect Jan. 1, 1909. The North Carolina legislature passed a similar law to take effect on the same date, provided the same be ratified by the people. The popular vote on May 26 resulted in a majority of 44,000 for the new law. In this State 69 of the 98 counties were already no-license, the remainder having either licensed saloons, or county dispensaries. This is the first Southern State to adopt statutory prohibition by popular vote. It is noteworthy that the campaign was almost entirely free from agitation by professional temperance orators and demonstrations by women and children. Although the constitution of Oklahoma embodied State prohibition, it also included permission to the State to establish a dispensary system for the sale of liquor for medicinal purposes and of alcohol for industrial and scientific uses. Under this proviso the Billups law (popularly dubbed "Billups' Booze Bill") was passed March 24, authorizing the establishment of a State agency and of local agencies in towns of 1,000 or more. This law provides that all State and local agents should be appointed by the governor; that liquor sold by local agents must be furnished by the State agent and be stamped by the State; that liquor could be sold only on a physician's prescription; and that careful weekly reports must be sent in. It was viewed by some as a practical and effective means of greatly reducing the illicit traffic cultivated by prohibition and of thereby reducing the demoralization resulting from continued violation of law. However, much opposition developed to the new scheme, and

through resort to the initiative and referendum the legislative enactment was referred to the voters for approval in November. They rejected it, thus forcing the State authorities to close out the new dispensary system, and putting the State once more on a strictly prohibitory basis. The Ohio Legislature passed a law forbidding private liquor clubs in dry territory. More important, however, was its enactment providing for county local option. Under this law, in effect Sept. 1, 1908, fifty-seven counties voted dry before the end of the year, closing 1,902 saloons, and making 62 out of the 88 counties in the State dry. This law contains the noteworthy provision that if a county having dry towns (under previous local option laws), votes wet, the dry towns shall remain dry; but if a county having wet towns vote dry, all towns become dry. In West Virginia a vigorous Sunday closing law was enacted; it requires that saloons be closed from midnight Saturday until 5 a. m. Monday, during which time no one shall be allowed on the premises for any purpose, the bar shall be open to full view from the street and a light shall be kept burning in the room.

During the year the activity of the Anti-Saloon League, especially in extending prohibition by local option, reached to practically every State in the union. The general superintendent of the league stated at the end of the year that approximately 11,000 saloons had been closed in the United States during 1908. The local option movement was very strong in New England towns, especially in Massachusetts, Rhode Island, and Connecticut. In Massachusetts 20 out of 33 cities and 260 out of 320 towns were no-license at the close of the year. The substantial argument in New England in favor of closing the saloons was the increased economic welfare of the laboring population and the increased efficiency of labor resulting therefrom. In Rhode Island, a new law limiting the number of saloons to one for each 500 inhabitants, closed 158 saloons in Providence on Dec. 1. At the same time the city raised the license fee of retailers to \$1,000 and of wholesalers to \$1,500. In Arkansas and Texas the local option movement had gone so far by the end of 1908 that State prohibition was fully expected in 1909. In Kentucky 96 out of 119 counties, and in Virginia 71 out of 100 counties, were "dry."

The political activity of the saloon is arousing greater interest. At the November meeting of the National Municipal League much attention was given to this subject. In New Jersey a State Excise Commission appointed by the governor to take evidence on this and other questions connected with the saloon sent in a majority report on Dec. 15 finding that local judges, sheriffs, prosecutors, and mayors were largely under the domination of the manufacturers and dealers in liquors. The commission reported that these officers were subject to such domination because they owed their election to political leaders who were in turn under financial obligations to liquor dealers. A minority report did not concur in this finding of the majority. At Atlantic City, New Jersey, during the summer, the failure of local authorities to enforce the Sunday closing law, and an apparent defiance of the law by the liquor dealers, led to a determined assertion of the authority of the State by Governor Fort.

EFFECT ON LIQUOR TRADE. The most general grounds of opposition to the saloon are its alleged league with vice, gambling, and crime, its corruption of politics, and its nefarious control of city governments. Both brewers and retailers admit that the public has a just grievance, but each blames the other for existing conditions. Especially do the retailers claim that the brewers, by stimulating competition and by obtaining a mortgage on the retail business through the advancement of money and goods, have forced them to add to their incomes by conniving with vice and crime. The brewers have come to insist that unless the saloon is reformed the public will abolish it. To assist such reform and to offset the prohibition wave the National Model License League was formed in 1908 with the editor of *The Wine and Spirit Gazette* as president. It has ample funds and promises a vigorous campaign. The convention of the National Wholesale Liquor Dealers' Association at Niagara Falls in June condemned prohibition and local option as resulting in the confiscation of property, and yet recognized that abuses existed in the liquor traffic. Resolving that the licensed saloon properly regulated was the surest and safest method of promoting temperance, the association pledged itself to assist in placing the saloon business on the same plane as all other commercial interests. This new attitude of the trade was shown in an agreement made between brewers furnishing more than 90 per cent of the beer sold in saloons and hotels in New York city and the Committee of Fourteen for the Suppression of Raines Law Hotels. The brewers agree that when a committee to be appointed by the Board of Trade shall decide that any hotel or saloon is a disorderly house they will discontinue to supply beer to such premises and do all in their power to close it up. To carry out such ideas the Model Legal License League has been formed. For the first time the prohibition movement has cut down the production of liquor. The report of the Internal Revenue Bureau for the year ending June 30, 1908, showed a decrease of \$17,998,072 in receipts, as compared with the preceding fiscal year. Moreover, the receipts for July to Sept., 1908, inclusive, were \$7,262,000 less than during the corresponding months in 1907. The production of distilled spirits from grain during the fiscal year 1908 amounted to 126,989,000 gallons, which was 40,000,000 gallons less than in 1907.

FOREIGN COUNTRIES. ENGLAND. The effort to secure a new basis for the regulation of the liquor traffic aroused in England during 1908 a most violent agitation. The government introduced in the House of Commons in April a measure known as the "Licensing Bill." The imminent prospect of the passage of the bill aroused the liquor trade to utmost fury of opposition. They denounced the bill as a piece of fanatical confiscation. The Balfour law of 1904 virtually recognized a vested right to renewal and surrendered the control of licenses to the brewers by providing that in case of refusal to renew a license money compensation equal to the value of the license should be granted, such payment to be raised by a tax on all saloons of the neighborhood. The number of licensed public houses in England and Wales, including registered clubs, was in 1908 about 125,000. The number of persons employed in the liquor trade directly was variously estimated at from 300,

000 to 700,000. The amount invested in the business was estimated variously at from three-fourths to one and one-half billion dollars. The expenditures for liquor in the United Kingdom in 1907 totaled \$809,681,000. The "Licensing Bill" aimed primarily to recover to the State the control of the traffic by providing that after fourteen years from April, 1909, no compensation should be granted in case of refusal to renew licenses. See GREAT BRITAIN, *History*.

FINLAND adopted through its Parliament a drastic prohibition measure in 1908. This prohibits the distillation, importation, sale, transportation, and storage of alcoholic wares except for medicinal, technical, and scientific purposes, and makes the production and importation of such wares a state monopoly.

SWITZERLAND has experienced considerable agitation over the growing consumption of absinthe. In April the Swiss Parliament was besieged with demands for the initiative against the manufacture and sale of absinthe. In July the law preventing the manufacture and sale of absinthe throughout Switzerland was carried by a large popular majority. (See SWITZERLAND, paragraph *History*.)

For discussions of various phases of the Prohibition movement see the "Regulation of the Liquor Traffic" in *The Annals of the American Academy of Political and Social Science* for Nov., 1908.

PROTESTANT EPISCOPAL CHURCH. A religious denomination which traces its descent as a member of the Anglican communion through churches established in the American colonies, and the Church of England. The church in 1908 comprised in the United States 65 dioceses and 21 missionary districts, including those in Alaska and the insular possessions. There are also eleven foreign missionary districts. There were in 1908 103 bishops of the Protestant Episcopal church, including 28 missionary bishops. Three bishops were consecrated during the year: Henry Douglas Robinson to be bishop of Nevada; Frederick Focke Reese to be bishop of Georgia; and Frederick Joseph Kinsman to be bishop of Delaware. During the year from Nov. 1, 1907, to Nov. 1, 1908, the church lost by death six bishops: Ellison Capers, bishop of South Carolina; Leighton Coleman, bishop of Delaware; Edward Jennings Knight, bishop of Western Colorado; Henry Codman Potter, bishop of New York; Henry Yates Satterlee, bishop of Washington; and George Worthington, bishop of Nebraska. By the death of Bishop Potter, David H. Greer, coadjutor bishop of New York, became automatically bishop of New York. Another notable loss by death was that of Rev. Morgan Dix, rector of Trinity church, New York City, since 1862.

According to statistics collected by the *Living Church Annual* and *Whittaker's Churchman's Almanac* for 1909, the number of communicants in the church in 1908 was 886,403, an increase of 25,405 over the figures for 1907. The clergy numbered 5,205, the lay readers 2,456. There were 7,654 parishes and missions and 52,411 persons confirmed during the year; in the Sunday schools there were 437,420 scholars and 48,329 teachers. The total contributions from all sources were \$17,643,330. The foreign missions of the church are conducted in West Africa, China, Japan, Cuba, Mexico, Brazil, Pan-

ama Canal Zone, and Haiti. The church also maintains jurisdiction over certain American churches in Europe and charges a bishop with this oversight. Domestic missions are carried on throughout the United States and its possessions.

Perhaps the most significant incident in the history of the church during the year was the discussion which arose from differences of opinion concerning the interpretation of an amendment to Canon 19, adopted by the general convention at Richmond in 1907. This canon formerly provided that no person might officiate in any congregation "without sufficient evidence of his being duly licensed or ordained to minister in this church." The amendment provided that the bishop of any diocese or district might give "permission to Christian men who are not ministers of this church to make addresses on special occasions." Some held that this permission was restrictive of liberty formerly claimed and largely exercised; others held that it was a dangerous relaxation of the church's law and tradition. Shortly after the conclusion of the general convention strong opposition appeared in a few places to the employment of the privileges of this canon. Rev. William McGarvey, rector of St. Elizabeth's Church, Philadelphia, published a pamphlet in which he charged that the church had, by the enactment of this amendment, wholly revolutionized Anglican and Catholic practice with respect to ministers of other than Episcopal ordination. Other writers took a similar view. Although the amendment to the canon did not legally go into effect until Jan. 1, 1908, several licenses were given by bishops for ministers of non-Episcopal religious bodies to preach sermons in churches at stated services of the church at which the delivery of a sermon is ordinarily expected, and sermons were preached by clergymen of other denominations in Episcopal churches in various parts of the country. This led to eager discussion of the meaning of the canon as amended by the House of Bishops in the convention. Certain of the clergy of the Protestant Episcopal church contended that its claim to Catholicity had been fatally impaired by the possible opening of the pulpits to unorthodox teachers and felt constrained to promote a secession from that church to the Roman communion. In the early part of the year, Dr. McGarvey, mentioned above, with 15 other clergymen, abandoned their orders, applied for deposition, and stated their intention of joining the Roman communion. In addition to this, the Mother Superior and three sisters of the community of St. Mary, of which Dr. McGarvey had been the chaplain-general, entered the Roman church. Similar steps were taken by a few theological students, some members of St. Elizabeth's church in Philadelphia, and some laymen. In the early spring a memorial, said to bear the signatures of 1,163 clergymen, was addressed to the House of Bishops, petitioning this body to "take measures at the general convention of 1910 to expunge from Canon 19 the words which had constituted the amendment," but this petition was not brought officially before the House of Bishops during the year. The bishops have showed themselves very generally conservative in their interpretation of the canon.

During the year there were two movements in the interest of reunion of the Protestant Episcopal church and other bodies. One was the

formation in February in New York of an Anglo-Roman Union, with the object of uniting the Anglicans with the Apostolic See, "the basis being the belief in the Roman primacy." The second movement was inaugurated by Dr. Newman Smyth, a well known congregational clergyman of New Haven. In several articles and addresses he maintained that Protestantism is a passing force, which has largely failed and which must probably be succeeded by a new Catholicism.

The Church Congress of 1908 was held in Detroit, beginning May 12. Among the subjects discussed were: "The Relation of Christianity to Mental and Spiritual Healing"; "The Constructive Value of the Higher Criticism"; "The Civil Mission of the Church"; "The Influence of History upon Theology and upon Religion"; "The Relation of Christendom to Heathen Nations"; "The Place of Organized Christianity in Modern Life"; "The Place of Character in Salvation."

One of the most notable movements of the year was that inaugurated at Emmanuel Church, Boston, which became widely known as the Emmanuel Church Movement. See EMMANUEL MOVEMENT.

PSYCHICAL RESEARCH. The address of the president of the British Society for Psychical Research, Mrs. Henry Sidgwick, appeared in the society's *Proceedings* (vol. xxii, part 57). The president reviewed the work of the society since its beginning. She noted that, in addition to the seven authenticated cases of veridical hallucinations of dead or dying persons, reported for a period of ten years in the Census for Hallucinations, two similar cases had been reported for the decade just closing. The investigation of "telekinesis" has, for the most part she thinks, come to a negative issue. Telepathy, on the other hand, is the most promising subject of inquiry; though the establishment both of the fact of telepathy and of its nature stands in need of further evidence. One theory makes the telepathic agent or vehicle physical, another psychical. The matter is intimately connected with the problem of survival after bodily death. In Mrs. Sidgwick's opinion the society had made a "distinct advance" in this problem through the automatic writings of Mrs. Verrall, Mrs. "Holland," and others, and the trance-writing of Mrs. Piper. "Cross-correspondences" (i. e., automatic communications received by different persons in different places, purporting to come from a common source—as the "Myers control"—and involving "cross-references") were reported by J. G. Piddington in the same number of the *Proceedings*. About 120 experiments were made with six different automatists. Here is an instance of the method: The sitter asks the Myers control (Jan. 16), through Mrs. Piper, to mark his messages sent through other mediums with a sign, "e. g. a triangle within a circle." Twelve days later (Jan. 28) this figure appears in automatic writing by Mrs. Verrall. Many examples of "concordant automatisms" are given in detail. The concentration of interest among "researchers" upon mediumistic evidences of a future life is everywhere apparent in current publications. In America, J. H. Hyslop added to his long list of "research" books a volume of essays (two of them new), called—after the last essay—*Psychical Research and the Resurrection*. The work covered "more or less of the whole field

and may be regarded as a supplement to *Science* and a *Future Life*, with conclusions quite the same." In "subliminal or subconscious mental action" is discovered the key to "mental phenomena." An optimistic forecast of the future of psychical research appeared in *The Coming Science* by H. Carrington, who declared that if "one single fact which the psychical researcher defends be proved true" the current conceptions of science must be remodeled. "We should open communication with a world of spiritual intelligences, they apparently producing phenomena which we are called upon to study; and the solution [sic] of these phenomena will, without doubt, form the coming science." The same author has published during the year *The Physical Phenomena of Spiritualism*. The marvels of mediumship, from Crookes to Paladino, were discussed in light and sprightly dialogue in H. Garland's *The Shadow World*, a book which will attract persons possessed of a curious interest in alleged "psychical phenomena." The author inclines to the belief that mediumship is a matter, not of spiritism, but of "unexplored human biology." As an antidote to *The Shadow World* should be read *The Marvellous Creations of Joseffy* (D. P. Abbott), an account of the clever and mystifying performances of a new conjurer, and *The History of a Strange Case*, written by the same author. The current literature of psychical research displays three notable characteristics: redundancy, optimism, and an increasing recognition of the essential difference between its labors, methods and interests and those of the psychologist.

PSYCHOLOGICAL ASSOCIATION, AMERICAN. See **PSYCHOLOGY**.

PSYCHOLOGY. The achievements for the year 1908 issued for the most part from interests and undertakings which were carried over from the preceding months. General works of value in pure psychology were few. The applications of science to practice, on the other hand, were many and diverse. In them power psychology gave more than she received. She can, however, afford to be generous. Feeling, attention, and the question of "thought-elements" continued to be centres of interest, though their status has not materially changed. Animal psychology and the psychology of the abnormal expand at a rate that is almost pathological.

MEETINGS. The 17th annual meeting of the American Psychological Association was held during the Christmas holidays, at Baltimore, in affiliation with various scientific and philosophical societies. G. M. Stratton, of Berkeley, Cal., was president of the Association. The programme included some thirty papers on general, theoretical, comparative, genetic, social, and educational psychology, and the psychology of the abnormal. The Southern Society for Philosophy and Psychology met in annual session at the George Washington University (Washington, D. C.), Feb. 26-27. The American Experimentalists convened at Harvard University, April 15-16, and the Experimentalists of the Continent at Frankfurt a. M. in the following week.

GENERAL BOOKS AND TREATISES. New systematic works were few. Mention must be made of S. Witasek's *Grundlinien der Psychologie*, an outline of theoretical psychology written from the standpoint of the Austrian school; a standpoint which is so far removed from current English and American thought (though the affilia-

tions are evident to the initiated) as to suffer from neglect. The psychology of feeling and attention was enriched by E. B. Titchener in a volume of eight lectures (*Lectures on the Elementary Psychology of Feeling and Attention*) delivered early in the year before Columbia University. The type of the book is rare. Facts and theories are set forth objectively and in their historical perspective, and interpreted in the light of a psychological system. The volume is useful, both as a repository and as a definite contribution to two difficult chapters of psychology. A small manual by C. E. Seashore (*Elementary Experiments in Psychology*) describes simple experiments, covering a large range of subjects (sensation, perception, memory, association, attention, action, etc.), and was designed as a supplement to introductory courses in the science. The exercises are to be carried through before the student enters the laboratory training courses of the laboratory.

The most important treatise of the year on psychophysics was an experimental and constructive monograph by F. M. Urban. The aspect of psychology which was making the widest appeal outside the science was its applicability to non-psychological ends. This aspect stood out during the year in unusual prominence. Psychological results, sought primarily for their own intrinsic value, were more and more utilized by the "expert" for educational, sociological, artistic, therapeutic, and economic purposes. Humanistic uses of psychological knowledge have created a place for an applied psychology, as the arts and professions of engineering have made a place for an applied physics. The most elaborately wrought out applications of mental science concern education and the treatment of the insane. They exist as "educational psychology" and "mental pathology."

A more recent application was made to law and to the processes of the court. The specific subjects to be considered by the pathologist include the psychology of crime, its detection, its course, its prevention, the mental status of the criminal, the responsibility and qualifications of the witness, the abilities of the juror and the advocate, the role of suggestion and hypnotism, and the credibility of evidence. It is obvious that all these matters involve psychological factors that can be estimated and valued only by persons in possession of an accurate and systematic knowledge of the human mind. The fruit of much recent work in this branch of applied psychology was brought to popular expression in H. Münsterberg's book, *On the Witness Stand: Essays on Psychology and Crime*. As the title implies, the author occupied himself almost exclusively with psychological problems relating to the witness in the court of law, his liability to illusory perception and memory, his bias, his prepossession, his suggestibility, and with the means of acquiring testimony which is objectively as well as subjectively truthful and reliable. Much pertinent material which was common property of psychologists was, for the first time, made accessible to the general reader. The dubious character of some of the methods proposed will not invalidate the main contention of the book—that the taking of testimony involves mental facts which can be properly considered only by the psychologist.

The Psychology of Advertising, by W. D. Scott, a volume whose studied attractiveness should effect an advertising of psychology, illustrated

small bits of psychological fact by abundant reference to current advertisements, futile and successful. The book was considered certain to interest the advertisers. The ethics of the work was another matter. The great moral desideratum is, of course, the exercise of a psychological control that shall fit the attractiveness of the display to the worth or indispensability of the article vended.

Among the applications of psychology at two removes stands the practice of clergymen of certain therapeutical methods which call for acquaintance with facts of mind. Much was heard during the year of this practice. (See EMMAUEL MOVEMENT.) One or two publications should be noticed. *Religion and Medicine*, by E. Worcester, S. McComb, and I. H. Coriat, is the authentic description of "the work in behalf of nervous sufferers which has been undertaken in Emmanuel Church, Boston." It discussed "the religious and scientific principles" on which the work rests. The field is the field of functional nervous disorders and the chief method is psychotherapy. Neither was new; the only feature of the undertaking that calls for comment was the unusual union of clerical, medical, and psychological functions. The psychology of the book was typical of much current writing. The psychologist recognized it at a glance. It invariably begins by regarding consciousness as a reservoir fed from the unmeasured depths of the subconscious. It never fails to put in all the powers and faculties and resources required for later emergencies. It makes glib reference to Schopenhauer and Frederic Myers, W. James and W. H. Thomson and T. J. Hudson. It delights in authorities and extols (without understanding) the experimental method and the latest opinion. It knows no restraint in speculation and is seldom troubled by the logic of a theory. The success of the whole undertaking is another matter. With the three most powerful sanctions that move civilized man, namely, religion, science, and the art of healing, success could scarcely be wanting; and (perhaps fortunately for mankind!) the efficacy of the sanction does not necessarily stand in direct proportion to the knowledge of the human agent. Two new social psychologies appeared during 1908: *An Introduction to Social Psychology*, by W. McDougall, based upon the doctrine of instincts, and *Social Psychology*, by E. A. Ross, which sets out from the facts and fancies of imitation and suggestion.

SENSATION. A moderately warm object (still not warm enough to produce pain) when brought into contact with the skin gives rise to the experience of heat. This experience differs from warmth, from cold, and from pain. Thunberg suggested in 1896 that "hot" was due to the simultaneous excitation of cold-organs in the skin (which produce, when excited by a "warm" stimulus, paradoxical cold) and warmth-organs. Sydney Alrutz (University of Upsala), in an article (*Zeitsch für Psych.*, xlvii, 161, 241), brought further proof of the double origin of "heat" by demonstrating that the "latent time" of paradoxical cold and of heat coincide; i. e., that the experience of heat and of paradoxical cold arise the same length of time after the hot stimulus is applied. Alrutz found, moreover, that in the mouth pure "warmth" is producible only on the outer and inner lips. Elsewhere a temperature sufficiently high to excite the warmth-organs excites also (paradoxically) the cold-

organs and heat (not warmth!) is experienced. This author thinks that in its qualitative character heat stands to warmth and cold as orange stands to yellow and red; it is like both but contains neither. Upon this point, introspections differ.

In 1907 was noted Bingham's case of difference-tones in a subject who had lost the tympanic membrane,—a case which offered difficulty to the current Helmholtzian theory of audition, since that theory found the cause of difference-tones to lie in the asymmetry of this membrane, the "drum-skin" of the ear. In 1908 L. Hermann came forward (*Archiv für die gesamte Physiologie*, cxvii, 419) to save the principle of the theory by transferring the asymmetrically vibrating body from the ear to resonant bodies outside, or, for some cases, to the bones of the head. Two vibration-rates imposed upon a body possessing "asymmetrical elasticity" (e. g., the common support of two tuning forks or of two wind-blown reeds) may give rise to one or more combination (difference or summational) tones. Thus all sounds of this class are referred to a single set of conditions. The psychology of audition seems then to have superseded the old distinction of objective and subjective difference tones. (Cf. *Combination Tones and Other Related Auditory Phenomena*, 1908, by J. Peterson.) The nature of the alkaline taste (German *Laugc*) has been much disputed. Sometimes it has been held to be an elementary taste, like salt or bitter; at other times, a mixture of taste qualities (e. g., bitter and salt, Goldscheider). W. Sternberg maintained (*Arch. für die gesamte Physiol.*, cxv., 526) that it was not a taste at all, since it can be set up upon any part of the skin or mucous membrane. An analytic study of tickling (E. Murray, *Amer. Journal of Psych.*, xix, 289) revealed a close relationship of the tickle to contact-sensation and to pain. Tickling was defined as "an intensely vivid complex of unsteady, ill-localized and ill-analyzed sensation, with attention distributed over the immediate sensory contents and the concomitant sensations reflexly evoked."

FEELING. The most deeply entrenched of all the theories of feeling is the *teleological*,—the theory, namely, that finds pleasure useful and beneficial, pain harmful and injurious. It is of the common-sense kind and supports itself by apt and striking illustrations taken from everyday life. As a scientific doctrine, however, it has long been unsatisfactory, and at last a competent critic has arisen to expose its bad logic. D. C. Nadejde began a searching examination (*Die biologische Theorie der Lust und Unlust*, Heft 1, 1908), which was one of the year's achievements in the psychology of feeling. It will no longer be possible to make uncritical reference to a theory that owes its respectability rather to its antiquity and honorable associations than to its logical cogency. In *Les inclinations, leur rôle dans la psychologie des sentiments*, G. R. d'Allonnes attempted, but without signal success, to show that emotions arise from visceral disturbances, and not from the objective and expressive signs (such as weeping, trembling, shivering, blanching) upon which the James-Lange theory lays stress. The author's chief support was a single pathological case, a woman who showed visceral anæsthesias and whose emotions were abnormally reduced. In a speculative paper (*Psych. Rev.*, xv, 201), M. Meyer suggests that *intensity* of neural action may be the substrate of pleasantness and un-

pleasantness. Other theories of affection were reviewed and criticised. E. B. Titchener hazards "the guess that the 'peripheral organs' of feeling were the free afferent nerve-endings distributed to the various tissues of the body" (*Lectures*, etc., 292). The "psychogalvanic reflex" (characteristic deflections of the galvanometer connected with certain neural and apparently also conscious functions) developed during the year a widespread interest. Attempts were made in various quarters to add the galvanometer to the appliances used in the expressive methods of psychology. It was too early, however, to say what the psychophysical importance of the "reflex" was. For some of the more recent discussions see Peterson and Jung (*Brain*, July, 1907), Ricksher and Jung (*Journal of Abnormal Psych.*, Dec., 1907-Jan., 1908), Binswanger (*Journal für Psych. und Neur.*, x, xi, Bietrag), B. Sidis and H. T. Kalmus (*Psych. Rev.*, xv, 341).

PERCEPTION. Attention was called last year (YEAR BOOK, 1907, 660) to Linke's psychological explanation of stroboscopic movement, movement produced, *e. g.*, by kinetoscopic or "moving-picture" devices. Linke's work, carried out under W. Wundt's guidance, drew a perfect avalanche of opposition and protest (*Zeitsch. für Psych.*, xlv, 345, 429; xlvii, 203, 291, 297, 321). Wundt and Linke treated the stroboscopic perception of movement as an illusion resting upon mental (assimilative) processes. The illusion lies in the failure to note the successive phases of the object presented with "blank" intervals, the observer seeing a single object in motion instead of what is really "given"—a series of different objects at rest. The adverse critics, K. Marbe and E. Dürr, referred the perception to physiological conditions which fall, in part, under Talbot's law of the fusion of successive stimuli. The discussion, which grew exceedingly complicated and technical, was of psychological importance because it concerns the description and explanation of one of the major groups of perception, the perception of moving objects. It touched a more popular interest through its relation to the various commercial devices for the scenic production of living and active things. Wundt's contentions can not be said to have been substantiated during the year. H. C. Stevens discovered (*Psych. Review*, xv, 69), in the course of an investigation into the perceived size of objects seen in indirect vision, that an object lying on one side of the visual field tended to appear either larger or smaller than the same object when transferred to the other side. This difference of apparent size Stevens connected with right-handedness, because he noticed that right-handed persons tended to overestimate the size of objects set on the right, while left-handed persons more frequently overestimated objects on the left. If the two things are connected, however, it is not easy to determine which is cause and which is effect. The psychological problems involved in reading were being attacked in 1908 and the few years previous, from various directions. The ocular functions (the nature and the rate of movement and pause of the eyes, the definition of the retinal image), perception of the symbols on the page, attention, the connection of reading with speech, the function of mental imagery, and the conscious processes underlying the meaning of the words read, have all been investigated. These matters, together with the history of reading

and writing and the pedagogy of reading, were brought together in orderly arrangement by E. B. Huey (*The Psychology and Pedagogy of Reading*, 1908).

ATTENTION, ASSOCIATION, IDEATION AND THOUGHT. *L'Attention*, a French work by an American psychologist, W. B. Pillsbury, was brought out during the year in English, in a considerably modified and expanded form. The subject of attention is exceedingly complicated and difficult. The complication arises less from the nature of attention itself than from (1) the infusion into it of various non-psychological factors and issues and (2) the wide interrelations of attention and other mental facts and functions. The book under discussion set these matters into their just perspective and brought together the compendious literature of the subject. Titchener's book, already cited, regarded "sensory clearness" as the fundamental aspect of attention. Some years ago, R. Ranschburg noted in experiments with abnormal observers that memory for a line of figures (as 67428) was weakened if the figures were followed by a similar line (as 67538). He explained this fact by assuming that the like or homogeneous elements in the two memories inhibited each other, or, rather, that they led to a mutual cancellation in the underlying cerebral processes. The explanation has never been satisfactory, and the problem was reopened by A. Aall (*Zeitsch. für Psych.*, xlvii, 1), who performed new experiments and reviewed the whole method at length. Aall went deeper than Ranschburg and found that the confusions and forgettings in the like objects studied (both letters and figures) rest upon no less than seven different factors. The memorial disturbances arise, not from the clash of like sensations, but from the more complex processes of reproduction and recognition. The matter was not altogether settled. It needed to be worked over under simpler conditions, and especially did the clashing of similar memories need to be brought into relation with the facilitation which is effected through repetition (learning by heart and habituation). Experiments conducted in the laboratory of the University of Illinois indicated that the ideational type tends to change in school children from the visual (fourth grade), through the motor (sixth grade), to a balanced type (about the eighth grade), and back to a visual type in university years (*Psych. Bulletin*, v. 98).

MENTAL INHERITANCE. An interesting sequel to Heyman and Wiersma's work of 1907 (see YEAR BOOK, 1907, 661) appeared (*Zeitsch. für Psych.*, xlv, 321). The Dutch psychologists had found by their use of the questionnaire method that women are, on the average, more emotional, less egotistical, and less intellectual than men. To this result a woman raised the pertinent objection that the census was taken and the standards set by men. The objection was met by the authors in a supplementary census conducted by sixty-five women. The former results were confirmed, except that the intellectual functions fall out somewhat differently for the sexes. The new census gave men the first place where ideational complexes of wide extent are involved, but accorded to women greater intuitive powers. Thus honors between the two sexes were again divided!

ABNORMAL. Alienists and psychopathologists continued to disagree upon the meaning of "mental disease," its relation to "symptoms," and the part played by mind in the origination

and development of mental disorders. A. Meyer expanded (*Psych. Bull.*, v. 245) his "dynamic psycho-biological" conception of abnormal states, showing a preference for the hybrid terms "instinct," "habit," "capacity," "reaction-type," and "adjustment," to either the more technical and analytical terms of psychology or the notions of disease current in medicine. E. Bleuler prefers, on the other hand, to distinguish between "somatic" diseases and mental symptoms, while C. G. Jung takes a middle ground and admits consciousness to a limited participation in the causation and course of disorders. Meyer's new list (p. 255) of reaction-types (really a classification of insanities) is of interest to the psychologist of the abnormal. However, its thin disguise of older classificatory schemes suggested that this list is not yet quite definitive. *A Mind that Found Itself: An Autobiography* (C. W. Beers) is the extraordinary account by an educated layman of experiences prior to and during a cycle of maniacal-depressive attacks. The experiences are recounted in detail and with great vividness. As a human document the book possesses unusual interest. The motive which led to its publication was, however, not personal but social and moral. The work is a plea for reform in the conduct of insane hospitals and sanatoria and in the training of physicians and attendants for the intelligent and humane treatment of patients.

ANIMAL PSYCHOLOGY. *The Animal Mind* (M. F. Washburn), anticipated in last year's review (p. 663), appeared in 1908. Its chief value lay in its psychological interpretation of the objective facts of animal activities, though the students of behavior were not slow to recognize its service to the biological sciences as well. The book furnished an object lesson, much needed at the present time, in the difference between animal psychology and the study of animal behavior. Current biological tendencies in American psychology minimized this difference. As a result, much work that concerns itself primarily with the adaptive activities of animals is accepted in some quarters as a direct contribution to the mental sciences. Reviews of recent investigation upon animals (*Psych. Bull.*, v. 179; *Journal of Comp. Neur. and Psych.*, xviii, 309, 511; *Journal of Abnormal Psych.*, Feb.-March) make it clear that attention is mainly directed to the sensory equipment of animals and to those modifications of behavior due to repetition of performance. In an article on the "phyletic background of genetic psychology," G. S. Hall entered a plea (*Amer. Journal of Psych.*, xix, 149) for the study of instincts, especially the study of the origin and evolutionary development of instincts in the race. Instinctive behavior is, he maintained, superior to rational behavior because it "regulates conduct in the interest of the species at every point, while consciousness is selfish and is exactly measured by the degree to which the individual has broken away from the dominance of the race and set up for himself against it." The conclusion seems to be the result of taking one's stand and then picking one's facts. The reader is left with the impression that facts of the opposite tenor might as easily be found. Indeed, E. L. Thorndike, starting with a different set of associations, works to quite the opposite conclusion (*Essays Philosophical and Psych.*, etc., p. 587). He brings himself to believe that the human sort of consciousness makes for individual satisfaction, and

that this in turn conduces to "meliorism for the species." It is a striking coincidence that almost upon the same day "human reason" should have been pronounced both "a disease of our infant race" and an agent of "human satisfaction." Experiments made by S. Smith (*Journal of Comp. Neur. and Psych.*, xviii, 499) and confirmed in part by the present writer and others indicated that a degree of "educibility" is possible in so simple an organism as *paramecium*. What "education" means for the protozoan consciousness remains, however, to be seen. From the continuous observation of individual amebas, for several days together, D. Gibbs concluded (*Amer. Journal of Psych.*, xix, 232) that these organisms display, like higher forms, alternate periods of activity and rest. This alternation cannot, however, be called in strictness a rhythm. The remarkable orienting feats among birds have long furnished a puzzling problem to comparative psychology. Factors already urged are visual landmarks, and the direction of sunlight. Neither of these "cues" seems sufficient to explain the extraordinary homing flights of terns sent out far beyond their normal range, i. e., over a thousand miles (J. B. Watson, *Psych. Bull.*, v. 51). The study of animal imitation was advanced during the year by new experimental material. Watson found in his work with monkeys no imitation either of his own acts or those of other monkeys (e. g., the use of a rake to draw in food) that involved the intentional bending of means to ends—the inferential type of imitation (*Psych. Bull.*, v, 169). C. S. Berry, on the other hand, discovered (*Journal of Comp. Neur. and Psych.*, xviii, 1) that one member of a family of Manx cats would, under some circumstances, repeat the successful manoeuvres of another member, such as opening a trap door and getting food. This repetition usually came suddenly, after a delay, and it was observed both when the imitator was itself fed and also when it only *saw* the performing cat fed. Berry called this "imitation," and it undoubtedly was imitation in the sense of a performance with a "model." Whether he is right in calling it "voluntary imitation" may fairly be questioned. Attention to the model seems to be involved both with the cats and in the case of monkeys reported from Harvard University at the December meeting of the American Psychological Association. Watson's monkeys certainly were attentive enough and dexterous enough; their failure to repeat the model (the act seen) may have been due to their insufficient analysis of the performance. The relatively small part played by imitation of a high order in the monkey's life is probably just owing to his great skill in learning *without* a model. Recent studies have shown the importance of distinguishing *biological* imitation (repetition of the performance of another) and *psychological* imitation, a mode or modes of conscious acquisition. It was likely that not one but several different forms or grades of psychological imitation will be found to exist among the higher vertebrates.

PUBLIC HEALTH. See FOOD AND NUTRITION.

PUBLIC HEALTH ASSOCIATION, AMERICAN. A society founded in 1872 for the advancement of sanitary science and the promotion

of measures for the application of public hygiene. The work of the Association is divided into four parts. At the meetings of the General Association, general subjects in relation to sanitary science are presented. The Laboratory Section, the Section on Vital Statistics, and the Section of Municipal Health Officers consider subjects coming within their special jurisdiction. The next meeting of the Association will be held in October, 1909, in Richmond, Va. The present officers of the Association are: President, Dr. Gardner T. Swarts, Providence, R. I.; First Vice President, Dr. R. M. Simpson, Winnipeg, Manitoba; Second Vice President, Dr. Jesus Chico, Guanaquato City, Mexico; Third Vice President, Major Charles F. Mason, M. D., Washington, D. C.; Secretary, Dr. Charles O. Probst, Columbus, Ohio; Treasurer, Dr. Frank W. Wright, New Haven, Connecticut.

QUEBEC. A maritime province of Canada. Area, 351,873 square miles. Population in 1901, 1,648,000. Quebec, the capital, had 68,840 inhabitants in 1901. For details respecting population, education, production, commerce, etc., see CANADA. The provincial government consists of a Lieutenant-Governor, appointed by the Governor-General of Canada and acting through a responsible Ministry, and a bicameral legislature consisting of a Legislative Assembly of 24 members appointed for life, and a Legislative Assembly of 74 members elected for five years. The present Lieutenant-Governor is Sir C. Alphonse P. Pelletier. The present Premier is Sir Lomer Gouin.

HISTORY. The session of the provincial legislature for 1908 began in February and was prolonged on April 26. The legislation included measures furthering the policy of the preceding two years, which aimed at the building and equipment of new schools, technical, commercial, and normal, and developing colonization and agriculture. In May a general election was decided upon, and it was held on June 8, when the Liberal government of Premier Gouin, which had been in power three years, was returned by a large majority. The chief plank of the platform on which the Premier appealed to the people was the increase of the grant for education to \$1,000,000 annually. The Conservatives elected fourteen members, and the Nationalists, under the leadership of Mr. Bourassa, two. The National party proved to be practically negligible. It stood for an idea of separate French political development which is more of a survival from a past state of things than a growing movement to be reckoned with. During the year the finances of the province, owing to economy of administration, were put upon a sound basis, and the last payment of the debt which had been standing for thirty years was paid. The area of the province was increased by the addition of the district of Ungava. For the Ter-centenary Celebration, see under CANADA.

QUEENSLAND. A state of Australia. Area, 670,500 square miles; population at the end of 1906, 535,113. Brisbane, the capital, had

an estimated population of 132,468 at the same time. (For details regarding population, education, production, etc., see AUSTRALIA.) The executive power is vested in a Governor appointed by the Crown and acting through a responsible ministry. The Parliament consists of a Legislative Council of 44 members, appointed for life by the Governor on the advice of the Ministry; and a Legislative Assembly of 72 members, elected for three years by universal suffrage, irrespective of sex. The present Governor is Lord Chelmsford; the Premier, W. Kidson.

HISTORY. After the February elections, which returned 25 Ministerialists, 25 Kidsonites and 22 Laborites, Mr. Kidson succeeded Mr. Philip as Premier. Parliament opened on March 3. The government announced that it would introduce measures for a referendum in the event of a deadlock between the two houses and for extensive railway building. In October Mr. Kidson, having formed an alliance with Mr. Philip, the former Premier, there was a division in the ministry and two members resigned. The reconstituted ministry was still in favor of the progressive legislation proposed, but was distinctly anti-Federal. On the reopening of Parliament on Nov. 17, Lord Chelmsford, the Governor, pointed to the fact that while settlement was going on with great rapidity it was not in proportion to the opportunities afforded, and excellent land still remained unoccupied. Relations with the Federal government were, he said, still the cause of anxiety. See AUSTRALIA.

RABIES. The increasing prevalence of rabies in the early part of 1908 was the subject of considerable agitation and popular alarm. The yearly mortality from this disease in the United States varies between 100 and 300. In the District of Columbia during the first half of the year 43 persons were bitten by dogs infected with rabies, and at the request of President Roosevelt the commissioner ordered all dogs muzzled for the ensuing six months. According to Hart (Bureau of Animal Statistics), in the preceding 12 months a positive diagnosis of rabies was made in 44 cases and of these 33 were found in the District of Columbia. These 33 animals bit 16 people, 46 dogs, 2 horses and 2 cows. This condition of affairs was believed fairly representative of the rest of the country. About 16 per cent of the victims of the bites of rabid animals develop hydrophobia, the remainder escaping through the protection afforded by clothing, on account of the slight extent of the injuries, or (especially) because the nerves escape injury. In New York City, during the summer months, 60 special policemen were detailed by the Department of Health to destroy all stray, unmuzzled or unleashed dogs, whether licensed or not. The effect of this crusade was to allay popular apprehension and to impress upon dog owners their duties to the community. Professor Woodhead called attention to the entire absence of rabies in Great Britain, due to a regulation, strictly enforced, that every dog wear a muzzle. At the same time, a strict quarantine against imported dogs was established, with the result that in 6 months' time the disease was eradicated in the United Kingdom. In the United States control of the disease is rendered difficult by the diversity of local ordinances and the opposition of misguided persons who object vociferously to the alleged cruelty of muzzling dogs. The method approved by the New York Department of health for dealing with cases of real or sus-

pected cases of rabies was to insure prompt and thorough cleansing of the wound, bleeding being favored by warm bathing and suction; ragged wound edges to be trimmed off and the wound cauterized. If feasible, the suspected animal is preserved alive and placed under expert observation; or, if killed, the head or brain forwarded in a sealed glass jar for examination at the laboratory.

RACING. The 1908 racing season, especially as far as the New York State tracks were concerned, ended most disastrously, because of the passage of the Agnew-Hart bills by the State legislature. By these bills bookmaking and gambling at race tracks was placed in the same position as regards the laws as elsewhere, and consequently were suppressed by the police. Almost immediately after they were passed the attendance at the track meetings in the vicinity of New York City fell off to so great an extent that the jockey clubs and racing associations incurred heavy losses or gave up their meetings. (See *NEW YORK*.) The racing itself was of a high standard, several horses making notable performances. *Colin*, owned by J. R. Keene, won three races and was unbeaten in fifteen starts. *Ballot*, also owned by Mr. Keene, was unbeaten in five starts, and *Priscillian*, owned by A. Belmont, was unbeaten in seven starts. J. E. Madden's *Sir Martin* won eight races, and A. Belmont's *Fair Play* and J. R. Keene's *Maskette* also were consistent winners. As in the previous year, the list of winning owners was headed by J. R. Keene, the total amount of whose winnings was \$287,912. Other winning owners and the amounts won were: J. E. Madden, \$170,453; A. Belmont, \$112,625; H. P. Whitney, \$76,880; F. F. Forsythe, \$37,545. Notter and Dugan were the two leading jockeys, the former's record being: first, 140; second or third, 213; unplaced, 171; and the latter's: first, 126; second or third, 158; unplaced, 254. In England the winning owner was J. B. Joel, with \$131,230, and in France, W. K. Vanderbilt, with \$263,640. The winning jockey abroad was Danny Maher.

New records made in the United States during 1908 were: $3\frac{1}{2}$ furlongs, *Carmiso*, in 40 2-5 seconds; $4\frac{1}{2}$ furlongs, *Preceptor*, in 51 seconds; $5\frac{1}{2}$ furlongs (circular track), *Colloquy*, in 1 minute 52 seconds; 1 mile, *Centre Shot*, in 1 minute 37 1-5 seconds; 1 1-16 miles, *Royal Tourist*, in 1 minute 44 1-5 seconds; 15-16 miles, *Ballot*, in 2 minutes 9 3-5 seconds; 1 mile and a furlong, *Vow Populi*, in 1 minute 50 seconds. The entries in the English Derby included A. Belmont's *Norman III*, a 6-to-1 favorite, and W. K. Vanderbilt's *Seasick II*. Neither of the American entries, however, figured, the event going to the Italian filly *Signorinetta*, whose time was 2 minutes 39 4-5 seconds. The record for this race is 2 minutes 36 4-5 seconds, made by *Spearmint* in 1906. Mr. Vanderbilt's *Seasick II* ran a dead heat for the French Derby, and *Northeast*, another Vanderbilt horse, won the Grand Prix de Paris.

The principal racing events in the United States, winners and time were: Kentucky Derby, *Stone Street*, 2:15 1-5; Metropolitan Handicap, *Jack Atkin*, 1:38 3-5; Suburban Handicap, *Ballot*, 2:03 (record); Futurity, *Maskette*, 1:11 1-5 (equaling record); Brooklyn Handicap, *Celt*, 2:04 1-5.

The trotting and pacing season contributed several new records, the best performance being: Stallion, *Allen Winter*, 2:06 $\frac{1}{2}$; two-year-old filly, *Czarevna*, 2:12 $\frac{1}{2}$; three-year-old filly, *Leading Lady*, 2:07; green stallion, *Fleming Boy*, 2:07 $\frac{1}{2}$; gelding, *Highball*, 2:03 $\frac{3}{4}$; three-heat race, *Hamburg Belle*, 2:05 $\frac{1}{4}$ (average); three heats and third heat over a two-lap oval, *Locust Jack*, 2:10 $\frac{1}{4}$, 2:10 $\frac{1}{2}$, 2:09. In pacing, the stallion *Minor Heir* made a record of 1:59 $\frac{1}{2}$, and the mare *Citation* equaled the record of 2:01 $\frac{3}{4}$, made by *Ecstatic*.

RACQUETS AND COURT TENNIS. The American court tennis championship tournament was held under the auspices of the New York Racquet and Tennis Club, April 8-12. In the preliminary rounds E. H. Miles, England, defeated C. E. Sands, United States, 6-2, 6-1, 6-3; Payne Whitney defeated T. A. Havemeyer, 5-6, 6-4, 6-0, 6-0. In the finals Miles defeated Whitney, 6-4, 6-0, 6-1. The challenge round between Jay Gould, the champion, and Miles resulted in an easy victory for Gould, the score being 6-2, 6-4, 6-1, 6-2. In the preliminaries for the gold racquet championship (Tailer emblem), held at Tuxedo, P. Lorillard, Jr., defeated Kingdon Gould, 6-4, 6-4, 6-2, and in the finals Jay Gould defeated Lorillard, 6-0, 6-1, 6-0, thereby becoming permanent owner of the trophy. The world's amateur championship was decided in London, May 9-16. In this tournament the finals were won by E. H. Miles, who defeated V. H. Pennell, 4-6, 6-5, 6-1, 6-3. Jay Gould, in the challenge round, retained the title by defeating Miles, 6-0, 6-2, 1-6, 6-1. The gold racquet championship tournament (Mackay emblem), held at Tuxedo, resulted in a victory for J. G. Douglas, New York, who defeated F. F. Rolland, champion of Canada, 15-8, 16-6, 18-16. In the national amateur racquet championship, Boston, Feb. 17-22, Q. A. Shaw defeated P. D. Haughton in the finals, 9-15, 15-7, 15-3, 11-15, 15-5. The championship in doubles was won by Scott and Boylston of Boston. In the annual New York-Philadelphia inter-city competition, the New York representatives were successful. The world's professional champion, Cecil Fairs, England, was challenged to defend his title by Jay Gould, the contest to take place in 1909.

RAE, CHARLES WHITESIDE. An American naval officer, died in Washington on May 13, 1908. He was born in Hartford, Conn., on June 30, 1847, graduated at the Rensselaer Polytechnic Institute in 1866 and at the Naval Academy in 1868, as third assistant engineer. He became second assistant engineer in 1869, assistant engineer in 1874, past assistant engineer in 1875, chief engineer in 1893. Under the Personnel law he received the rank of commander in 1899 and that of captain in 1903. He was a member of the Nicaragua and Tehuantepec surveying expeditions in 1870-71. During the Spanish War he served on the *Iowa* and was advanced three numbers in grade "for eminent and conspicuous conduct" at Santiago. In 1903 he

became engineer-in-chief of the navy and chief of the Bureau of Steam Engineers, with the rank of rear admiral.

RAILWAYS. Two causes combined to make the year 1908 a trying one for the railways of the United States. First, it was an after-panic year, and second, it marked the putting into effect of a vast amount of more or less hostile and restrictive legislation enacted by Federal and State legislatures in 1907. Not since the panic of 1893 did the railways suffer so acutely from the standpoint of decreased traffic. Gross earnings did not begin to fall off sharply after the panic of October, 1907, until the last of December of that year. In January, 1908, earnings dropped abruptly, reflecting the cumulative effects of the financial disturbances. The decrease in January was 12.5 per cent and in May the decline had reached its maximum, with a decrease of more than 22 per cent. The recovery began in September, when crops began to move, and by the end of November traffic was within 3 per cent of that in 1907. The number of idle freight cars is also a good index of the contraction of business. In November, 1907, there was a shortage of 44,000 cars, which changed by January, 1908, to a surplus of 340,000 cars. In May this surplus had increased to 410,000 cars. In other words, one-fourth of the freight cars of the country were standing idle, with no freight to be moved in them.

RECEIVERSHIPS. The mileage of railways which went into the hands of receivers during 1908 as a result of the business and financial depression following the panic was larger than in any year since 1893, which was the last severe panic year. A total of 24 roads operating 8,009 miles of track and having total outstanding capital liabilities of \$596,359,000 were turned over to receivers. The two most important roads included in the list were the Seaboard Air Line, with 2,611 miles, and the International & Great Northern, with 1,106 miles. The so-called Gould roads were particularly hard pressed. Besides the International & Great Northern, the Western Maryland, Wabash-Pittsburg Terminal, West Side (Pittsburg) Belt, and the Wheeling & Lake Erie all became involved. These five roads represent more than one-fourth of the total mileage placed in receivers' hands during the year. The Erie was saved from a similar fate only by the intervention of E. H. Harriman, who advanced the money to meet its interest charges. In 1907 only seven roads went into receivers' hands, and their combined mileage was only 317 with a total capitalization of \$13,585,000.

Many railway systems were saved from bankruptcy only by the practice of strict economy in operation and maintenance. By discontinuing all betterment work under way or contemplated and by cutting down the train service to a minimum, expenses were for the most part kept well within income. Some roads even showed slight gains in net earnings for part of the year, due to this policy. Costs of labor and supplies, however, continued at top levels during the period of depression, and this led to a more or less general agitation on the part of the railways for an increase in freight rates commensurate with the increased cost of conducting transportation. No important increases were put into effect, but at the end of the year an effort was still being made to bring this change about. Some of the more prosperous roads, which have long been

on a liberal dividend-paying basis, reduced their rate as a measure of economy. Pennsylvania, New York Central, Atchison, Topeka & Santa Fe, Boston & Maine, Norfolk & Western, and Louisville & Nashville all reduced the rate 1 or 2 per cent.

RAILWAY FINANCING. In the spring of 1908, the money market began to assume a favorable investment tone for the first time in more than a year. The Pennsylvania Railroad put out an issue of \$40,000,000 of 4 per cent consolidated mortgage bonds, which were heavily oversubscribed. In June the Union Pacific issued \$50,000,000 of 4 per cent bonds and these were followed by other large issues by companies which still retained good credit. Other roads which were in need of funds resorted to smaller issues of short-term notes bearing higher rates of interest. The new issues of railway securities of all kinds put out during 1908 aggregated close to \$1,000,000,000. In 1907 a total of \$1,800,000,000 in new securities was authorized and in 1906 \$2,700,000,000.

FEDERAL AND STATE LEGISLATION. During 1907 the movement for government regulation of railroads became widespread and a large number of restrictive laws were passed by national and State legislatures. Partly owing to the fact that only 13 State legislative bodies were in session and partly owing to some abatement in the popular outcry against the abuses charged up to the railroads, there was a marked decrease in number and severity of new regulation laws passed during 1908. Few of those enacted had any great importance and by reason of unfavorable court decisions in some States, many extreme measures put into effect the previous year were declared wholly or partly inoperative or unconstitutional. In fact, the court decisions handed down in 1908 nullifying many of the newly created statutes of 1907 may be said to have been far more important than any new legislation passed during the same period.

In order clearly to understand the effect of some of the recent court decisions relating to the activities of the Interstate Commerce Commission, which is the regulating body of the Federal government, it may be of interest briefly to summarize the history of the powers conferred on that body by Congress. The Interstate Commerce Act was passed originally in 1887 and was amended in 1889. It was found inadequate to prevent unjust discrimination against shippers and in 1903 the Elkins law was enacted, imposing fines of from \$1,000 to \$20,000 for violations of the provision against rebating. Further abuses manifesting themselves, which could not be prevented under this law, a new and more stringent act, known as the Hepburn law, was passed on June 29, 1906. This gave to the Interstate Commerce Commission power to prescribe rates, with provision for review of its decisions by the courts; broadened the definition of common carriers to include all railroads, pipe lines, express and sleeping car companies; forbade the issuance of free passes to any but employees and their families and a small list of other persons; forbade railroad companies to transport any commodities other than lumber produced or owned by the carrier; required schedules of all tariffs to be filed with the Commission; imposed more severe penalties for rebating; empowered the Commission to prescribe a uniform method of keeping accounts, and, finally, enlarged the Commission to seven mem-

bers. This act became a law on August 28, 1906.

During the session of Congress which adjourned in June, 1908, six laws affecting railroads were enacted. A law limiting the working hours of railroad employees, which went into effect March 4, 1908, was the only important legislation of the session of 1907. The six laws of 1908 included a strict employers' liability act, applicable to railroads engaged in interstate traffic, a law prohibiting use of ash pans on locomotives which require that a man shall go under the engine to open them, a law prohibiting the transportation of explosives in passenger trains or boats, an amendment to the Interstate Commerce act of 1907 revising the provision relating to issuance of free passes to enlarge the definition of employees, a bill giving the Interstate Commerce Commission authority over the street railways in the District of Columbia and a clause in the civil appropriation bill providing for an appropriation of \$50,000 for the expenses of the Block Signal and Train Control Board acting under the direction of the Interstate Commerce Commission to investigate and pass on all forms of railway safety appliances. Of these six bills, the employers' liability law was by far the most important. Up to the close of 1908, it had not been finally passed on by a court of last resort, although there was doubt in some quarters of its constitutionality.

STATE RAILROAD COMMISSIONS. No new State railroad commissions were created in 1908. In 1907 commissions were created in Alabama, Colorado, Montana, Nebraska, Nevada, New Jersey, Pennsylvania and two in New York. These brought the total number of States having commissions up to 40, an increase of 11 in three years.

STATE RAILWAY LEGISLATION. The laws affecting railroads which were passed by State governing bodies during 1908 were of only minor importance, compared with the wave of hostile legislation which swept over the entire country a year previously. In 1907 39 State legislatures were in session and they enacted over 300 new laws affecting railroads. Ten States alone passed 177 laws. The new legislation of that year covered every phase of railroad operation and was not confined to any one section of the country, as was the Granger agitation of 1870 to 1877, but spread from coast to coast. The most important laws passed were those limiting the working hours of railroad employees, modifying employer's liability for accidents as affecting railroad employees, reciprocal demurrage laws which imposed a penalty on the railroads for not furnishing cars to shippers on demand, and laws reducing freight and passenger rates. Twenty States passed laws during 1907 reducing passenger rates, and in 11 States freight rates were also subject to general reductions.

ACTIVITY OF INTERSTATE COMMERCE COMMISSION. During 1908 the Interstate Commerce Commission received 5,194 formal and informal complaints relating to all branches of its supervision over railroads. Prosecutions for violation of the provisions of the act to regulate commerce, principally for rebating and similar practices, were actively carried on. A total of 48 indictments for rebating were returned during the year and 41 prosecutions were concluded, of which 31 resulted in convictions and fines. There were transmitted to the United States district attorneys in various districts 276 cases

involving 1,117 distinct violations of the safety appliance law. The number of violations reported to the Commission was only about half the number reported in 1907. The Commission established regulations covering the filing and publication of tariffs of express companies similar to those required of railroads. It also promulgated a uniform system of accounts for express companies and electric railways coming under its jurisdiction. A uniform system of accounting, including an allowance for depreciation, was promulgated for steam roads in 1907, in accordance with one of the provisions of the Hepburn law of 1906. As a result of a long series of hearings, the Commission recommended the adoption of a new uniform bill of lading by all carriers in the United States, and substantially all of the important roads have adopted this new form, which is a great improvement over the bills formerly used.

COURT DECISIONS. The decisions of courts of last resort handed down during 1908 in matters relating to railroad affairs were of great importance. A few will be briefly referred to. The most important case involving rebates during 1907 was that carried on by the government against the Standard Oil Company. The Standard Oil Company of Indiana was charged on 1,462 counts, each covering the shipment of a single car, of accepting from the Chicago & Alton a rate of 6 cents per 100 pounds on oil between Whiting, Ind., and East St. Louis, Ill., whereas the published tariff was 18 cents per 100 pounds. Judge Landis, of the United States District Court at Chicago, before whom the case was tried, found the defendant guilty, on August 3, 1907, and imposed the maximum fine of \$20,000 for each count, or a total of \$29,240,000, after taking into account the fact that while the fine was many times the total capitalization of the immediate defendant, the Standard Oil Company of Indiana, it was not more than the capitalization of the parent corporation, the Standard Oil Company of New Jersey. The case was carried on appeal to the United States Court of Appeals, which handed down a decision in December, 1906, reversing the trial court on the following grounds: (1) That the fine was excessive and confiscatory, (2) that intent to violate the law was not proved, as it was not shown that the agents of the Standard knew the legal and published rate to be 18 cents; (3) that the separate offenses, if any, consisted in the number of settlements of freight bills made and not in the number of carloads shipped. The government gave notice of its intention to begin a new suit, having been denied the right to appeal to the United States Supreme Court and bring the original proceedings up for review.

Another important event of 1907 was the investigation of the Harriman lines by the Interstate Commerce Commission. Testimony was taken during January and February of that year, with the object of bringing to light the relations existing between the Union Pacific Railroad and the various corporations controlled by it through stock ownership. The investigation centred particularly about the part played by Edward H. Harriman, the dominating influence in the affairs of Union Pacific, in the reorganization of Chicago & Alton. During the course of this inquiry, in which it was shown that Union Pacific owned 18½ per cent. of the stock of Baltimore & Ohio, 8 per cent. of New York Central, 18½ per cent. of Atchison, Topeka & Santa

Fe, 30 per cent. of Illinois Central and smaller percentages of the stock of other roads, Mr. Harriman was questioned as to his holdings of Chicago & Alton stock at the time of the reorganization of that road and the price at which his personal holdings and those of his business associates were transferred to the Union Pacific. On advice of counsel, Mr. Harriman refused to testify on this point. Proceedings were begun to compel him to testify on this and other similar transactions, and the case was carried to the United States Supreme Court. Late in December, 1908, the court handed down a decision upholding Mr. Harriman in his refusal to answer the questions asked by the attorneys for the Interstate Commerce Commission on this point. The court held that "the purposes of the act for which the Commission may exact evidence embrace only complaints for violation of the act and investigations by the Commission upon matters that might have been made the subject of a complaint. The main purpose of the act was to regulate the interstate business of carriers and the secondary purpose was to enforce the regulations enacted. The power to require testimony is limited to the only cases where the sacrifice of privacy is necessary—those where the investigations concern a specific breach of the law." This decision was thought effectively to check the power of the Commission to begin general investigations of a similar character under the provisions of the Hepburn law of 1906.

On Sept. 10, 1908, the United States Circuit Court of Appeals for the Third Circuit, sitting in Philadelphia, decided that the so-called "commodities" clause of the Hepburn law was unconstitutional. This clause of the act prohibited railroads from mining and selling coal produced along their lines. The roads immediately affected by the decision were the Central Railroad of New Jersey, Lehigh Valley, Erie, Delaware, Lackawanna & Western, Delaware & Hudson, Pennsylvania and Philadelphia & Reading. This clause in the act was thought to be one of the most effective means for checking discrimination against independent shippers.

Previous to July 1, 1908, only one suit had been instituted to set aside orders of the Interstate Commerce Commission regarding adjustment of rates. Since that date 16 suits were begun. The questions presented in these suits were fundamental and aimed to test the constitutionality of the law itself. Up to the end of the year no decisions had been finally rendered in any of these actions.

The law regulating the working hours of railway employees became effective March 4, 1908. Eleven railroad companies began proceedings to restrain the Commission from enforcing the provisions of the law, but most carriers have accepted it. None of the proceedings had come to trial at the end of the year. Similar laws were passed in a number of States during 1906 and 1907. The courts of Missouri, Wisconsin and Arkansas declared the laws of those States unconstitutional.

Decisions affecting the rate reductions were numerous and far-reaching during the year. Test cases were begun by railroads in nearly all States in which lower rates were required by laws passed in 1907. The Supreme Court of Pennsylvania declared that the 2-cent-a-mile passenger fare law was unconstitutional. An injunction was issued by a Federal court in South

Dakota in January, 1908, restraining the State Railroad Commission from reducing passenger rates to 2½ cents per mile. The United States Supreme Court, in March, 1908, declared the rate laws enacted by Minnesota and North Carolina in 1907 to be unconstitutional, on the ground that they were confiscatory and because of the enormous penalties attached for violations. The Missouri law prohibiting corporations from transferring suits on appeal from the State courts to the Federal courts was declared unconstitutional by the United States District Court. These decisions favorable to the railroads indicated to some extent the unreasonableness of much of the legislation enacted during the previous year, which in the cases noted was completely overthrown or held in abeyance pending final adjudication.

CONSTRUCTION OF NEW RAILROAD MILEAGE. In view of the general condition of the railroad industry in 1908 it was not surprising that the mileage of new railroad lines built should show a marked decrease over the figures for 1907. In 1907, according to figures compiled by the *Railroad Age Gazette*, 5,212 miles of new main track were laid, while in 1908 only 3,214 miles were built, a decrease of 1,998 miles, or 38.3 per cent. In 1908, 5,623 miles were constructed. The mileage of steam railways reporting to the Interstate Commerce Commission as of June 30, 1908, was 226,121. The longest extensions completed during 1908 were those of the Chicago, Milwaukee & St. Paul, with 790 miles of new track in Montana, Idaho and Washington; the Southern Pacific, with 448 miles, and the Great Northern, with 274 miles. In the east, the Virginian Railway built 131 miles in Virginia and West Virginia. The Grand Trunk Pacific laid 621 miles in Canada, and the Canadian Pacific 289 miles.

ELECTRIFICATION. There were a number of important developments during 1908 in the electrification of steam railroads. On July 1 the New York, New Haven & Hartford inaugurated complete electric service between Stamford and Grand Central Station, New York. No steam locomotives now enter this station with trains of either the New York Central or the New Haven. On Nov. 12 the Grand Trunk began electric operation of the Sarnia Tunnel under the St. Clair River. The system employed is substantially the same as that used on the New Haven, namely, 11,000-volt, single-phase alternating current collected from an overhead trolley wire. The Great Northern had built during the year the first of the three-phase alternating current locomotives which will be used in hauling trains through the Cascade Tunnel in the Sierra Nevada mountains. The Illinois Central announced late in the year that it was committed to a plan of electrifying all of its suburban lines around Chicago. Details of the equipment had not been decided upon at the end of the year. In December the Pennsylvania Railroad came to a definite decision to use direct current third-rail in its terminal electric zone in New York, including the river tunnels and the new station in New York City. See **ELECTRIC RAILWAYS**.

CAR AND LOCOMOTIVE BUILDING. The policy of the railroads of cutting down expenses to the lowest possible point during the year of business depression was sharply reflected in the dullness of the locomotive building industry. In 1907 the railroads were offered more business than they could handle with their equipment of

cars and locomotives, and large orders were placed for new rolling stock to meet the extraordinary demands. As a consequence, the output of the car building works and locomotive works in the United States reached a new high mark during that year. Including the output of a number of smaller builders in Canada, a total of 284,188 new freight cars and 5,457 passenger cars were purchased by the railroads of North America. Few orders for new equipment were placed after September, 1907, and not until late in 1908 did the manufacturing industry begin to show signs of recovery, following an improvement in traffic on the railroads. During 1908 the output was only 76,555 freight cars and 1,716 passenger cars, the smallest since 1904 and a decrease of 76 per cent. compared with the high record of the previous year. The accompanying table, compiled by the *Railroad Age Gazette*, gives the output of cars built in each of the years in the period 1903-1908:

Year	Freight	Passenger	Total
1903	153,195	2,007	155,202
1904	60,806	2,144	62,950
1905	165,455	2,551	168,006
1906	240,503	3,161	243,670
1907	284,188	5,457	289,645
1908	76,555	1,716	78,271

Locomotive building showed the same proportion of decrease in 1907 over 1908. (See LOCOMOTIVES.) The production of the 11 locomotive works in the United States and Canada for the years 1903-1908 is shown below:

1903.....	5,152	1906.....	6,952
1904.....	3,441	1907.....	7,362
1905.....	5,491	1908.....	2,342

BLOCK SIGNALS. One branch of railway construction did not show, on the face of the yearly returns, any effects of the setback following the panic of 1907. This was the installation of block signal apparatus. At the end of 1908, 60,709 miles of track were worked with the block system, as against 58,670 miles in 1907. More than 900 miles of track were protected with new automatic block signals installed.

RAILWAY ACCIDENTS. The accompanying table from *Accident Bulletin* No. 28, of the Interstate Commerce Commission shows the numbers killed and injured on American railways for the years ending June 30. It will be seen that the number of passengers killed in train accidents in the year 1907-8 was much less than half as much as it was in the previous year, and was only a little over half the average for the preceding three years 1905-7. The total of passengers and employees killed in train accidents equaled only 63 per cent. of the previous record, and the number of fatal coupling accidents, 239, was 20 per cent. less than in the year 1907. The report states that the large number of fatal accidents to employees, though greatly diminished, however, by the compulsory use of automatic couplers and the establishment of adequate regulations, is largely due either to breakage or failure of parts, or to disregard of rules and carelessness on the part of the employees. With the statistics showing the number of employees and passengers killed and injured should be considered the accidents to "other persons," which are not given in the bulletin, but are summed up in the annual statistical reports of the Interstate Commerce Commission. These include casualties at railroad crossings, to trespassers, to persons walking along the tracks, accidents to employees in shops remote from the railroad, and other accidents not occurring to passengers and to employees actually on duty. In the year ending June 30, 1907, under the heading "other persons," were recorded, 6,695 killed and injuries to 10,331, as compared with 6,330 and 10,241, respectively, in the previous year. The safety of passengers traveling on British railways is so often alluded to that some comparative statistics of interest. During the year 1908, according to the records of the Board of Trade, not a single passenger was killed in a train accident on a British line, but in 1907 the number of casualties was eighteen and in 1906, fifty-eight.

CASUALTIES TO PASSENGERS AND EMPLOYEES ON AMERICAN RAILWAYS, YEAR ENDING JUNE 30.

RAMÉE, LOUISE DE LA. An English novelist author (under the pseudonym, "Ouida," which represented her effort as a baby to pro-

nounce her own name) of *Under Two Flags*, *Strathmore*, *Puck*, *Moths*, and other once immensely popular novels, died at Viareggio, Italy.

on January 25, 1908. She was born in Bury St. Edmunds, of English-French parentage, in either 1839 or 1840, and was brought up in Paris and London. There is good evidence that her correct name was Ramée, and that she affixed the "de la" to suit a whim of her own. She lived for a time with her grandmother, in London, but soon after her success as a novelist she removed to Italy, where, in a handsome villa which she built at Lucca, she passed the remaining active years of her life, save for occasional and sometimes prolonged visits in London. She began to write when she was very young, became a contributor to *Colburn's Magazine*, and in 1863 published her first novel, *Held in Bondage*, which did not succeed, partly because, from its title, it was presumed to deal with the slavery question. But *Strathmore* (1865) quickly attracted attention, and her popularity was increased by *Chandos* (1866), *Under Two Flags* (1867) and *Puck* (1870). In 1904 the British Museum catalogue credited her with forty-one volumes. Her best known novels, in addition to those already mentioned, were *Tricotrin* (1869); *A Dog of Flanders* (1872); *Pascarel* (1873); *Two Little Wooden Shoes* (1874); *Ariadne, the Story of a Dream* (1877); *Friendship* (1878); *Moths* (1880); *The Village Commune* (1881); *In Maremma* (1882); *Bimbi Stories for Children* (1882); *Wanda* (1883); *Othmar* (1885); *Guilderoy* (1889); *The Silver Christ* (1894); *Two Offenders* (1894); *Le Selve* (1896); *The Massarenes* (1897); *Toxin* (1897); *La Streza* (1899); and *Street Dust* (1901).

Enormous as were Ouida's profits on her novels—for they had netted her a good-sized fortune—her extravagance and hopelessly unbusiness-like methods reduced her, in the last few years of her life, to a poverty, which, though probably exaggerated in the newspapers, was at least sufficient to get her name on the list of English civil pensions (in July, 1907), for \$750 a year.

RANC, ARTHUR. A French politician and writer, died on August 10, 1908. He was born at Poitiers, on December 20, 1831, and studied jurisprudence at Paris. In 1853 he was charged with taking part in the attempt made on the life of Napoleon III in the Opéra Comique, but was acquitted. He was subsequently put in prison, however, for his relations with the Carbonari. Upon his release he was again accused of conspiracy and exiled to the penal colony of Lambessa, Africa. Upon his return to France, in 1859, he took up journalistic work in connection with the anti-clerical papers, the *Opinion Nationale* and the *Nain Jaune*, and was imprisoned for four months for his writings. In 1870, after the fall of the empire, he was *maire* of the ninth arrondissement of Paris. He also served for a time as director of public safety, and in 1871 was elected to the National Assembly, which office he soon resigned. He was one of the first members of the Commune and used his influence to try to prevent the burning of the Tuileries. In 1873 he was again elected to the National Assembly, but was condemned to death for his connection with the Commune. He succeeded, however, in effecting his escape to Belgium. In 1879 he returned to France; two years later was elected deputy for the Seine, and in 1891 was chosen Senator. He remained in the Senate until 1900, when he failed of elec-

tion because of his activity in behalf of Dreyfus. In 1903 he became Senator from Corsica through the courtesy of Prime Minister Combes, who had been chosen Senator by two constituencies. Aside from his journalistic work, M. Ranc wrote *Le bilan de l'année* 1868 (1869); in collaboration with Castagnary, Paschal and others; *Le roman d'une conspiration* (1869); *Sous l'empire* (1872); *De Bordeaux à Versailles* (1877).

RANDALL, JAMES RYDER. An American journalist and poet, famous as the author of the words of the song, "Maryland, My Maryland," died at Augusta, Ga., on January 14, 1908. He was born in Baltimore, Md., on January 1, 1839, showed much literary precocity as a child, and at the age of ten years, entered Georgetown University. At that institution, six years later, his work in English won for him a medal which had remained unawarded for several years. His ill health forced him to leave college during his senior year. He was professor of English literature and the classics at Poydras College, in Louisiana, when the Civil War began, and it was here that he wrote his famous poem, "Maryland, My Maryland," the inspiration being a vivid newspaper account of the attack on the Massachusetts and Pennsylvania troops in Baltimore on April 19, 1861. The poem was published at once in the New Orleans *Delta*, and a few days later Miss Hetty Cary sang it in Baltimore to the old melody, "Lauriger Horatius." Mr. Randall enlisted in a Louisiana regiment, but was soon discharged because of his physical unfitness for service. He became a member of the staff of the Augusta (Ga.) *Constitutionalist* (afterward the *Chronicle*) in 1865 and a year later was made its editor-in-chief. In 1905-07 he was editor of the *Morning Star*, a Roman Catholic paper, of New Orleans. His poems have not been made into a book, but some of the better known of them are "The Lone Sentry," "There's Life in the Old Land Yet," "The Battle Cry of the South," and "The Cameo Bracelet."

RANDOLPH-MACON SYSTEM OF COLLEGES AND ACADEMIES. A system of educational institutions. Randolph-Macon College was founded at Boyton, Va., in 1830 and in 1860 removed to Ashland, Va. In 1890 its charter was amended to permit it to establish and maintain academies or other institutions of learning. Under this authority, academies for boys were opened in 1890 and 1892 and in 1903 the Randolph-Macon Woman's College was established in Lynchburg, Va., the citizens of that State having contributed \$220,000 for that purpose. This amount, now increased to \$530,000, constitutes the present plant of the Randolph-Macon Woman's College. It is on the "accepted" list of the Carnegie foundation and had in 1908 400 students. The Randolph-Macon Institute for Girls was added to the system in 1897. The system had in 1908 about 100 officers and teachers and over 1,100 students. The Chancellor of the system is Dr. William Vaughn Smith.

RECEIVERSHIPS. See RAILWAYS.

RED CROSS, THE AMERICAN NATIONAL. The American Association of the Red Cross was formed in 1882 as a voluntary reserve emergency organization, to relieve distress in time of war or calamity. This was practically a private
